The demand for book paper is along restricted lines and yet there are numerous signs of gradual improvement in this branch of the industry. Printers are mostly ordering as their needs develop but consumption of book paper is slowly though surely increasing, with the result mills are getting a little more business as time goes on. It is reported that book paper manufacturers in the Middle West are operating close to normal capacity, and those mills situated in the East are finding an outlet for about all of their current production, with operations on a fair ratio of full output.

Book paper prices have steadied to a pronounced degree. Instances are cited off and on of concessions being granted but it is noted that tonnage orders usually are involved in such cases, while manufacturers in general are maintaining quotations firmer than they were. Machine finished book is quoted at 6 to 6.25 cents a pound f.o.b. New York, with higher prices named on better qualities, and coated book is quoted at 8 to 12 cents per pound, depending on the quality.

Coarse papers are in moderate demand. It is true that consumers are seeking to fill their requirements in wrapping paprs with about the cheapest grade of such paper as is available, and imported kraft is displacing the domestic product in numerous consuming quarters, temporarily at least. Converters, however, are reported placing good business with domestic kraft mills, which keeps manufacturers fairly well engaged.

Fine papers are firm and the strong position of raw material—rag stock in particular—is creative of a rising tendency in bonds and ledgers, especially the higher grades. Demand is developing in a satisfactory way insofar as its steadiness is concerned, and the volume is of normal dimensions.

Box boards are in routine movement with demand gradually expanding as the spring season draws near. Prices are somewhat irregular owing to competition among manufacturers, and plain chip board is quoted at about $42.50 in a majority of cases f.o.b. New York, and news board at $45.

Mechanical Pulp

It is quite apparent that offerings of mechanical pulp by producers and importers have decreased in number and volume the last few days. This reflects the less favorable weather conditions experienced by grinders, and is naturally creative of a firmer price undertone in groundwood. No advance in market levels has been noted but sellers are much more insistent on receiving the prices asked, and not so many instances come to light where groundwood is bought at concessions.

Domestic grinders are reported securing $35 to $38 a ton f.o.b. pulp mills for spruce groundwood for prompt shipment, and in cases where consuming plants are situated faily close to producing points and a low freight is involved up to $40 has been reported paid. Imported groundwood is selling in New York at $33 and $34 a ton ex dock at this port, and importers in common are quoting $35 though most transactionsa re slightly under this price.

Foreign and Domestic Chemical Pulp

Prices of some kinds of chemical pulp display a strengthening tendency. Importers and domestic producers put much stress on the prevailing level of pulp values, it being contended that pulp is being sold at below the cost of production in this country and under the replacement cost abroad, which condition has somewhat of a steadying influence on prices. At the same time available supplies are large enough to keep market levels from rising notwithstanding that demand is developing in better volume than in several months.

Kraft is probably characterized by a firmer price tone than any other kind of pulp. Manufacturers in Sweden are quoting, as a unit, a minimum of 2.50 cents per pound landed American ports for No. 1 kraft, and importers say that any sales that are made in this market at lower figures involve pulp which "distress" holders have been obliged to sacrifice. Sulphite is quoted irregularly, with prices on foreign strong unbleached sulphite ranging around 2.65 cents ex dock New York, on imported bleached sulphite from 3.75 cents upward on the dock, and on foreign easy bleaching from 2.75 to 3 cents ex dock. Quotations ex dock New York and f.o.b. pulp mills follow:

Sulphite foreign—

Domestic Rags

There is much less excitement in the papermaking rag market than there was recently but demand continues active and prices seem to have steadied on well established levels with little or no sign of easiness in any quarter. Roofing rags are moving in a consistent manner although mills appear to be regulating their buying in such a manner as to have checked the upward march of prices. No. 1 roofing is bringing around 2.60 cents per pound f.o.b. New York, and No. 2 stock 2.40 cents. Old thirds and blues are exceedingly firm in price. Repacked blues are fetching 3.50 to 3.75 cents per pound New York, and miscellaneous pack-

Paper Testing Methods (1922)

A large edition of this handbook for paper mill laboratories was exhausted shortly after the type had been distributed. In view of the insistent demand the Technical Association has arranged for a republication and *Paper Testing Methods* is again available at $3 per copy.

The work covers detailed procedure for microscopical analysis, physical testing and chemical analysis of the paper with descriptions of the apparatus employed.

It is the only complete and up-to-date handbook on paper testing published in the English language.

It should be in the hands of every paper manufacturer and paper dealer as well as concerns who are large users of paper.

the trade journal devoted exclusively to the manufacture, sale and use of pulp and paper
Published by

Hughes Publishing Co., Inc.,
1478 Broadway, New York

ing has sold at as high as 3.25 cents f.o.b. this city. Old white rags are steady in demand and price, and it is stated that the best packings of No. 1 repacked whites have brought up to 9 cents a pound from writing paper mills. New cuttings hold firm and are moving in good amounts. Quotations f.o.b. New York are:

New Shirt Cuttings,		Overall Cuttings, Blue	9.25 @ 9.50
No. 1	14.00 @ 14.50	Washables	5.50 @ 5.75
No. 2	6.50 @ 6.75	New Black Mixed	5.00 @ 5.25

Black Silesias	5.50 @ 5.75	Roofing Rags, No. 2	2.40 @ 2.50

Imported Rags

Importers state there is a ready market among paper mills for practically all the supply of rags they are able to procure abroad. Conditions at primary sources are firming, and an important development is the report that France and Belgium have placed embargoes on the exportation of all kinds of rags, which is likely to lead to a further reduction in available supplies in Europe for American mills. Quoted prices on an ex dock New York basis follow:

Lins., White, No. 1	15.00 @ 16.00	German Linen, blue	5.00 @ 5.25
Ger. Blue Cottons	3.50 @ 3.75	German Linen, grey	6.50 @ 7.00

New Light Prints	7.00 @ 7.50	German Light Prints	4.00 @ 4.50
New Unbleached	10.50 @ 11.00	Dk. Colored Cottons	2.40 @ 2.60

Bagging, Rope, Etc.

Old rope is moving steadily to paper mills and at firm prices, domestic manila rope of No. 1 grade fetching 6.50 to 6.75 cents per pound f.o.b. New York and foreign manila rope 6.25 to 6.50 cents. Old bagging is in better demand although chief interest is shown by roofing paper mills, which are paying about 1.50 cents per pound f.o.b. this city. Old strings are a firm item and are quoted by dealers at 1.30 to 1.50 cents a pound at shipping points. F.o.b. New York prices are:

Gunny No. 1	1.50 @ 1.60	Wool Tares, heavy	1.50 @ 1.60
Foreign	1.40 @ 1.50	For. Manila Rope	6.25 @ 6.50
Wool Tares, light	1.40 @ 1.50	Domestic Rope	6.50 @ 6.75
Scrap Bagging, No. 1	1.40 @ 1.60	Mixed Strings	1.30 @ 1.50
Roofing Bagging	1.35 @ 1.50		

Old Paper

Most grades of old paper are favored with at least routine demand and not much change is recorded in prices. There are several classes of stock, however, which are little wanted by consumers, and prices of these are tending downward. Shavings, for instance, are in a dull market position. New York dealers offer No. 1 hard white shavings at 3.75 cents a pound f.o.b. this city, and are securing few mill orders; while No. 1 soft white shavings are selling only in spasmodic fashion at 2.90 to 3.15 cents per pound New York, depending on the quality of packing. Folded newspapers are steady in price at 95 cents to $1 a hundred pounds f.o.b. New York, and old No. 1 mixed papers are finding a fairly broad outlet among box board mills at a price basis of 75 to 85 cents a hundred pounds New York. Old kraft paper is firm at 2.25 cents a pound f.o.b. this city, and ledger stock is selling at 1.85 to 2 cents a pound New York. Quotations f.o.b. New York follow:

No. 1 Hard White Shavings	3.70 @ 3.90	Ledger Stock	1.85 @ 2.00
No. 2 Hard White Shavings	3.15 @ 3.40	Kraft, No. 1	2.25 @ 2.35
No. 1 Soft White Shavings	2.90 @ 3.10	New Manila Cuttings	2.00 @ 2.25
Box Board Chips	.80 @ .90	New Manila Env. Cuttings	2.75 @ 3.00
No. 1 Colored Shavings	1.60 @ 1.80	Bogus & Mill Wrappers	1.00 @ 1.10
Magazine flat stock	1.60 @ 1.75	News, strictly overissue	1.10 @ 1.20
No. 1 Crumpled	1.30 @ 1.40	Folded News	.95 @ 1.00
Solid Ledger Books	2.00 @ 2.15	No. 1 Mixed Papers	.75 @ .85
		White Blank News	2.25 @ 2.35
		Common Paper	.55 @ .60

Twines

Demand for twines is along strictly routine lines and is marked by no feature. In fact, consumers are buying almost solely against direct requirements, and jobbers also are placing orders with mills principally to cover actual commitments. Prices are holding, due for the most part to the strong price tone in raw material. Quotations are as follows:

Sisal Hay, pure	14.25 @ 15.25	Jute Wrapping twine, A grade	20.00 @
Manila Hay, pure	16.25 @ 17.25	Papermakers Twine	11.50 @
Sisal Lath yarn	13.25 @ 14.25	B. C. Hemp, 18	.39 @ .40
Manila Rope, pure, ¾ inch diameter	16.25 @ 17.25	B. C. Hemp, 24	.38 @ .39
Hardware Rope	14.25 @ 15.25	B. C. Hemp, 36	.37 @ .38
Jute rope, ¼ diam. and over, coils	13.00 @ 14.00	America Light India—	
Sail twine, A grade	20.00 @	No. 6	14.50 @
		No. 7	13.50 @

Chemicals

Papermaking chemicals are in fair movement against contracts but new demand is slow to develop. Quoted prices are well maintained with no changes of importance noted.

NO IMPROVEMENT IN NORWAY PAPER

Hopes Entertained at Beginning of 1923 Unrealized

AT the beginning of 1923 hopes were entertained by Norwegian paper and pulp manufacturers that the year would bring an improvement in the position of the industry. These hopes have not been fulfilled, says Acting Commercial Attache H. Sorenson in a report to the Commerce Department. In paper and pulp circles the opinion now prevails that although production has been maintained at almost normal during the past year, the prices received have not permitted a reasonable margin of profit.

The year commenced well enough, with good sales and partly rising prices during the spring, but as summer approached a slackening both in paper and pulp took place, which continued during the remainder of the year. Only through the doubtful benefits derived from the depreciation of the Norwegian currency during 1923 have the factories been able to keep running in the face of falling prices. The paper and pulp export markets have also during 1923 been adversely influenced by the strong protectionistic trend in tariffs the world over. Nevertheless, the total volume of the pulp and paper exports during 1923 was only a trifle lower than that of 1915, which was a record year from an export point of view.

INTERNATIONAL PAPER CLOSES TWO MILLS

Close Down Mills on Account of Overstocking, Company Announces

THE International Paper Company has closed down its two mills at Watertown, N. Y., on account of overstocking at the present time, Mr. Dodge, president of the company, announced. One of the plants produces ordinary newsprint and a higher grade of special print paper. The shutting down of the mills will not have any effect on the company, as they represent two minor and unimportant properties.

"The competition rendered by foreign manufacturers has not hurt the earning power of this company," Mr. Dodge continued. "Besides being engaged in the paper industry the company is also engaged in various fields which are productive. Earnings of the company in 1923 showed a sharp improvement over the preceding year, when a deficit of $4,715,797 was reported."

In connection with Mr. Dodge's announcement attention was drawn to the fact that the company recently increased the output of newsprint at its mill located at Three Rivers, Que., from 240 tons daily to 310 tons daily. A further increase is expected to be made shortly. The closing of the two Watertown plants shut off papermaking operations by the company in that sector. The company's third plant, that in Glen Park, has not been operated since 1921.

Chemists Support Plan

The Executive Committee of the American Chemical Society, which has a membership of nearly 15,000, has voted to support the Mellon tax reduction plan, it is announced by the treasurer of the Society, Dr. John E. Teeple of New York.

GOOD PAPER
—GOOD RESULTS

The effectiveness and pulling power of Direct Mail literature depends entirely on the proper selection of Paper. The finest illustrations possible or the best copy cannot get your message across if produced on paper that cannot stand the strain.

FRANKFOLD Enamel

a paper built for a purpose, will answer the requirements unusually well. The extra long, firmly knitted fibres assure good folding qualities and a required sturdiness. The beautiful and uniformly smooth surface will faithfully reproduce the sharp details of mechanical subjects or the subtle shades of color work.

FRANKFOLD ENAMEL preserves that freshness and inviting appeal so essential to successful direct-mail literature.

We will gladly forward some printed specimens or blank sheets for dummy purposes.

USES OF LOCOMOTIVE CRANE BY PAPER CO.

Has Been in Service for Three Hard Years in Washington

THE accompanying illustration pictures the locomotive crane that has been working for the past three years for the Inland Empire Paper Company, Millwood, Washington. The service it has performed in this time is, perhaps, not in the least unusual for locomotive cranes, but a letter recently received from this company, signed by Waldo Rosebush, serves to further emphasize the economy resulting from applying mechanical means for the movement of materials. Mr. Rosebush says:

> "During the there years' service we have had from this crane it has been subjected to exceptionally hard usage. Not only have we used the crane for loading and unloading logs in sixteen foot lengths, from such sizes as the grapple would handle down to logs with but a six inch top, but we have used it in digging several thousand feet of ditch for water mains and sewers, the ditches ranging from tour to eighteen feet in depth and upwards of twenty feet wide at the top.
>
> "In addition to all of the above, we have, during the past two years, pressed this crane into switching service in our yards. More recently we have found this crane capable of driving piles as well as a regularly equipped pile driver."

Substituting machines for hand labor wherever possible is the one certain means of overcoming possible labor shortage, minimizing labor difficulties and, in the larger percentage of instances, radically reducing material handling costs. The crane illustrated here was built by the Link-Belt Company of Chicago.

Waste Paper In Building

A new building material made from waste paper and designed for ceilings and wall linings has been perfected by a Swedish engineer, and production on a large scale soon will be undertaken.

The raw materials are ordinary waste paper such as accumulates in cities, clay and sulphate lye, the cheapness of which warrants an inexpensive finished product. The covering is said to be fireproof and durable; can be applied by unskilled labor, will take paper, paint or stain, and can even be polished.

It is a good nonconductor, and does not respond to changes in temperature.

Continental Moves

On February 25th the Executive Offices of the Continental Paper & Bag Mills were removed to the 10th floor of the Pershing Square Building, Park Avenue and East 42nd Street, New York, N. Y. The new telephone is Murray Hill 8410.

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

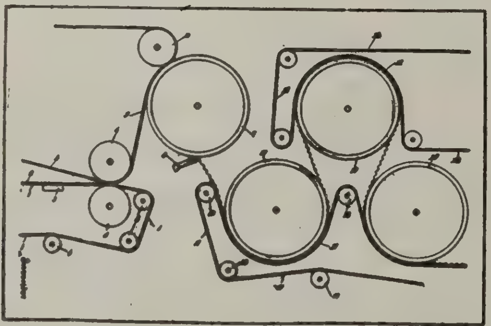
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shedding less lint than cold creped paper products.

JUST OFF THE PRESS

PULPWOOD AND WOOD PULP IN NORTH AMERICA

By Royal S. Kellogg

Author of "Lumber and Its Uses," "The Cost of Growing Timber," "The Timber of the United States"

270 Pages 87 Illustrations

A graphic presentation of one of the vital economic problems of the day—the securing of an adequate supply of paper.

This book is of special interest to everyone connected with the pulp and paper industry and equally so to all users of print paper. It points out clearly what must be done to develop sufficiently our supply of pulpwoods.

PRICE $4.00

Hughes Publishing Company, Inc.

1478 Broadway New York City

This price covers the cost of remailing answers directed to boxes, care of this office. Matter for insertion should reach the office of PAPER not later than the Saturday preceding date of issue.

All Advertisements under the Situations Wanted or Help Wanted Classifications are published FREE OF CHARGE, except for cost remailing letters addressed here.

POSITIONS WANTED

SALES CORRESPONDENT who knows buying, selling and sources of supply. EDGEBROOK, 1802-101 Park Avenue, New York.

FELT PAPERMAKER wants a position; knows the business from raw material to finished product; capable of supervising the erection and starting of a new mill; will accept any position to get started. Address Box 123, care of PAPER.

Technical assistant to official or technical director; B.S. and M.S. in Chemistry, 34 years of age, married, four years' experience in each of the textile and paper industries. Has handled laboratory, research and development work. Can read German and Spanish. Possesses originality, resourcefulness, capable of hard work and wide awake. Employed at present but available upon reasonable notice. Location immaterial. Address Box 1280, care of PAPER.

GRADUATE MECHANICAL ENGINEER, seven years' experience in United States and Europe in design and construction in pulp and paper mill machinery and as field and maintenance engineer; perfect detail knowledge of De Vains process. Address Box 1260, care of PAPER.

PULP AND PAPER MILL ENGINEER—Technical graduate, married, aged 35; fourteen years' experience in applied structural and mechanical engineering of pulp and paper mills. Capable of assuming the technical responsibility of your plant from the drawing board to the erected job. Thoroughly familiar with all process. Correspondence solicited. Address Box 1261, care of PAPER.

MECHANICAL ENGINEER, 14 years broad experience with large industrial firms desires responsible position as executive, supervising engineer, plant or mechanical engineer. Construction, office, plant efficiency and maintenance, mechanical processes, power plants, investigations, reports, etc. Will travel part time if desired. Member A.S.M.E., age 32, highest references. Address Box 1285, care of PAPER.

FOR SALE

FOR SALE—Unlimited quantities of finest pulpwood. F.o.b. mill in New York State, $23.75 per cord. Address Box 236, care of PAPER, 1478 Broadway, New York City.

POSITIONS VACANT

WANTED—Boss Finisher for Western mill. Must have experience in writings and bonds. Absolutely essential that this be a first class man. Address Box I. C. L., care of PAPER.

POSITIONS WANTED

SULPHATE CHEMICAL ENGINEER desires position. Technical graduate with mill experience. Prefer minor position with opportunity to work under big men. Address Box 1268, care of PAPER.

POSITION WANTED by young man who is familiar with the paper industry, chemistry, dyes. Write, giving salary and position you have open. Address Box 1278, care of PAPER.

PACIFIC COAST SALESMAN with established business relations covering several years as Pacific Coast representative of Middle West paper mills, desires connection with mills on Atlantic seaboard making writing, wrapping and specialties. Only first class lines considered. Address Box 1279, care of PAPER.

MISCELLANEOUS

WANTED—A paper company to locate a large pulp and papermaking plant in North Carolina, with a million cords of pulp wood deliverable at the plant at $3.75 a cord, a saving of $20,000,000. Lands for plants, fronting **deep water for deep sea** loading. Millions more cords of wood available very cheap. A clear stream of fresh water free for washing pulp. Address Box 245, care of PAPER, 1478 Broadway, New York City.

FOR SALE

Beaters—One N & W 48x48 rolls, 21″-6″. Two iron tub rolls 52″x40″.

Bed Plates—Large lot, all sizes. New.

Calenders—One 7 roll 72″; one 9 roll 72″; one 5 roll 78″; one 7 roll open side 84″. One 7 roll 124″.

Calender Rolls—Large assortment, all sizes; one 14x86″; one 18x84″; one 18x100″ and many others.

Coaters—One 45″ Waldron, double coater, and others.

Cutters—One 38″ Guillotine.

Cylinder Moulds—One 36″72″; one 30″x52″; one 12″x22″.

Drives—One No. 1 Reeves Class E; two No. 3 Reeves Class E, 4 to 1; one No. 3 Class E; one No. 6 Large Reeves; one No. 10 Reeves, F-3 to 1 with extra disc.

Dryers—48x116.

Exhausters—One Sturtevant.

Fans—3 Hunberry; 2 Perkins.

Jordans—One N & W Monarch, with new shell two Horne; two Emerson, large size, one base; one N & W Pony, with extra plug.

Pulleys—One 98″x34″ face, double arm, modern, Iron pulleys; Cone pulleys for Marshall Drives.

Pumps—One dry suction Knowles 12x22x18; one 1000 gal. Blake Tank pump; two Lawrence Mch. Co.'s Class A 8″ high duty; two 6″ Emerson make; one 4″ Centrifugal; one Type 4 Gould 5″ triplex, self contained. Two Lawrence Machine Co.'s Class A, No. 4, double suction pump for high elevation or for low speed. Thoroughly rebuilt and ready for shipment.

Press Rolls—One pair new, one RC 18x80″; one Gun metal 18x81″; one 16x75″; one RC 15½x73½″.

Rag Cutters—Two No. 2 Daniels; one Perkins.

Screens—4-8 pl. New Success.

Slitters—One 86″ P & J.

Winders—One 86″ P & J; one 100″ P & J; one 112″ M & W.

Wet Machines—One N & W with cut offs, mould 30x52″; two spare moulds.

One set Dillion Doctors for 80″ calender rolls.

MILLS MACHINE COMPANY
Lawrence. Mass., U. S. A.

THE CLEARING HOUSE—Continued

MISCELLANEOUS

WANTED—A second hand 80 or 84 inch Fourdrinier paper machine in good condition. In reply state full particulars and price. Address Box 1284, care of PAPER.

WANTED—A 2nd Hand Improved Machine Company's Standard Wet Machine with a single cylinder mould 36"x84". Must be in good condition. Address Box 1281, care of PAPER.

WANTED—A Niagara 2nd Hand Beater of 1500 to 2000 pound capacity. Must be in first class condition. Address Box 1282, care of PAPER.

TECHNOLOGIST in stained paper field, about 30 years' practical experience, specialist in paper, cardboard and paper board fields. Can furnish formulae. Solve manufacturing difficulties and install new improvements, particularly in the following fields—glazed paper, chromo papers, art printing papers, stained paper, marbled paper, carbon paper, waxed paper, etc. Can secure all materials as well as machines. Regular technical advice given.

Tells of His Battle

W. O. Frost of the Maine Department of Agriculture, state leader in the work of controlling the white pine blister rust in his annual report gives the following summary of the work of the year 1923:

"The most conspicuous features of the 1923 eradication season are that 39 towns appropriated $7,115.00; 39 towns spent $6,899.99; 48 pine owners cooperated, spending $8,760.34 and destroyed 1,191,418 ribes; acreage eradicated by owners 35,355, at a per acre cost of 49 cents; acreage eradicated by scouts, 301,098; number ribes eradicated by scouts, 13,862, at a cost per acre of less than two cents; total acreage eradicated in the state, 356,452; total number of wild ribes eradicated in the state, 1,209,280; per acre cost of eradication, six cents estimated acreage of pine protected, 117,008."

Pennsylvania Mill at Capacity

The P. M. Glatfelter Paper Co., Spring Grove, Pa., is running full at its local mill, with a contract for 11,000,000 pounds of paper on hand for the Government. It is expected to commence delivery on the order early in March. This tonnage for the Federal printing plant is about 3 times as large as any Government order handled in the last three years. The plant is equipped with 5 papermaking machines, with capacity for turning out 100 tons of finished stock every 24 hours. It is expected to continue operations on the same capacity basis, with full working force, for an indefinite period.

* * *

Aeroplanes For Forests

Jack V. Elliott, of Hamilton, Ont., has secured the contract from the Ontario Government to deliver to the Ontario Government on May 1 next thirteen Class A. HSEL type hydroplanes to be used for forest patrol work in New Ontario. Recently the Government decided to make a change in the system of forest patrol. For some years past the contract for northern patrol by airplane had been awarded each year to the Laurentide Air Service, with headquarters at Three Rivers, Que. During the winter Premier Ferguson reached the conclusion that the annual expenditure for this service was too great, and that a change was necessary. He had the department call for tenders with the result that the Laurentide people and Jack Elliott, the latter backed by Hamilton capital, put in tenders. After the tenders were opened the Government decided to operate its own service and commissioned Mr. Elliott to secure the thirteen planes necessary for the work.

Returns After Trip

S. R. Armstrong, manager for the receiver of the Mattagami Pulp and Paper Company, has returned to Toronto after a holiday trip to California and Florida. Mr. Armstrong will spend a few days at his home in Caledonia, N. Y., before going back on the job at the mill.

CAN STRAW SUBSTITUTE FOR PULPWOOD?

Investigation of Canadian Straw Leads to Much Speculation in Matter

THE reported intention of British interests to investigate the use of western Canadian straw for the making of paper has revived the perennial discussion of the possible use of grasses as substitutes for pulpwood. The burning of western straw, instead of its industrial utlization seems to many observers to be a serious waste. Large quantities of straw are reported to be wasted annually in the Canadian prairie provinces, but that straw is not ignored even at present is shown by 1919 census statistics which showed that the United States paper industry spent $3,394,947 in that year for this raw matterial, says the Monthly Bulletin of the American and Pulp Association.

The use of straw, formerly extensively used for the so-called butcher's manila, is now largely confined to the making of corrugated container boards.

As with other vegetable fibers of annual growth, the problems involved in its use are the expense of collecting at a single point sufficient to operate a mill, and of preserving the fiber collected in a short period, for use during an entire year. These problems are in addition to the special problems of manufacture involved in the use of such material.

Nothing has apparently come of most of the reports of glowing possibilities for the use of new papermaking materials according to Dr. C. J. West, of the National Research Council. In a letter to the American Paper and Pulp Association, Dr. West, who is chairman of the Technical Association's Committee on Abstracts and Bibliography, says:

"The best substitute as yet is bamboo, and that, of course, is almost a wood. The grasses with the possible exception of esparto are not making any headway. The reason apparently is because of the small yield per ton of grass fiber, and also perhaps the poor quality of paper resulting from such material. The extended studies by the Imperial Institute on tropical grasses indicate very clearly that a good grade of paper cannot be expected by the present methods of cooking."

A possible exception to the previous experience in the use of grasses, however, may be found in the use of the Florida saw grass. Extensive work has been done on the manufacture of pulp from this marine growth, and a paper mill is now building at Jacksonville to use this pulp.

John T. Mulroy Dies

John T. Mulroy, former official of the International Paper Company, of Ticonderoga, N. Y., died at his Denver, Colorado home, February 22, aged 65. Mr. Mulroy was a native of Fort Edwards, N. Y. His father died when he was only 13 years of age, the lad taking a position with a paper mill in New York state and by sticking to the business he worked up to the assistant managership of the International. About four years ago Mulroy's health failed and he came to Denver, where some of his children resided. He is survived by his widow, Mrs. Maria Mulroy; a daughter, Miss Elizabeth Mulroy, two sons, one the Rev. John R. Mulroy, pastor of St. Catherine's Catholic church, Denver, and Martin Mulroy, of Detroit; two brothers, Richard and Martin, the latter a Denver contractor.

A Few Stray Thoughts

It is getting so a man can't fill the engine with oil, but what he trembles in fear he will be called to Washington to testify.

* * *

It used to be said that the way to reduce taxes was to reduce them. That was before partisanship became a national pastime. It is our opinion that the leaders of the paper industry would prefer to have the Mellon tax plan put through as it was conceived, rather than to have a hybrid, make-shift bill such as has been discussed. But any reduction is something.

The proposed Federal 25 per cent. tax reduction on all incomes, to be applied to 1923 payments, would be a great boon to mankind—that is, if you have an income.

* * *

The stories that Paper is running on the import and export situation are causing favorable comment throughout the paper industry. As we know of nothing more important to the industry just now, we are specializing on this important problem. We would like to see the perpetrators of violations to the Anti-Dumping Law punished. We would like to see the present ruinous German competition eliminated, and that same competition placed on a sane, even basis. We would like to see—as a result—the paper business of this country get better and put on a thoroughly prosperous, instead of a precarious, foundation.

* * *

We have great hope in W. B. Bullock, of the American Paper and Pulp Association, in his campaign to go to the bottom of the dumping problem. He is one of the hardest working dynamos at the association headquarters. He is not the coating on the surface of the paper, he is the base.

* * *

The big annual convention is just one month away. It is time to make those necessary arrangements to be present as well as think up excuses for the wife.

Everybody can learn something each week. If we were not so modest we would say one good way to do so is to read Paper regularly. But your heads and managers and superintendents of mills must pick up the good points brought out in the story of the Grandfather mill at Merrill, Wisconsin. Here is a mill without labor trouble. It is not a technical article, but it gives much information on the technic of handling men. Be sure and study it.

* * *

Rudolph Seiber's article on the "Weight of Wood and Quantity of Pulp," which is translated for Paper from the Swedish is valuable to American papermakers. It gives much information that is new and much that refreshes the memory of paper technologists. It is worth studying.

* * *

We don't mind saying frankly that we are endeavoring to get Dr. Arthur S. Klein, one of the most famous European paper authorities, to act as foreign editor of Paper. Dr. Klein is as much at home in Italy's paper mills as he is in Sweden's mills. He jumps from Germany to France and then to Denmark. And everywhere he is recognized as the peer of the most advanced thinkers in paper matters in the world. And we feel that we will be successful in this quest. Just naturally the best minds along paper lines should and do gravitate to Paper.

* * *

Our parting word this week is: Don't hesitate to hurl that brickbat or that bouquet at Paper. We want every person connected with the industry to feel free to "take my pen in hand and let you know——" etc., etc.

The Magazine of the Paper Industry

Imports and Exports

Third of a Series of Articles on a Situation That is Vital to the Life and Welfare of the Paper Industry

The German Situation

Another Phase

The assertion that Germany is the real key to the paper marketing problem is given much substantiation in this article. While it has long been thought that the real solution of the import and export trouble was in Germany it has not been openly so stated very frequently.

Germany is to blame, the authorities interviewed say. And the matter will not adjust itself until the Reparations problem is solved in Germany. As long as it remains unsolved the American paper industry cannot hope for much improvement.

Here is an article that goes deeply into the matter. It should be carefully read and digested whether you agree wholly with its sentiments or not.

What are your views on this subject?

EVERYWHERE questions were asked by PAPER of men who have studied the serious import situation, regarding the real cause of the trouble, the answer was the same.

It all resolved down to one thing—Germany.

There is a pronounced tendency in America to play fair, to be generous to a fallen foe, to even overdo philanthropy of purse and thought and spirit. In recent years, when Germany has been blamed for anything, the reaction is that somebody is trying to blame Germany for something she is not guilty of. Of course this holds true in the matter of the paper industry.

Nevertheless, in the cold analysis of the facts, invariably the cause for the flood of paper imports from abroad has gone back to Germany.

"If Germany will become stable in finance and industry, there will be nothing to fear from abroad." Thus spoke one of the leading exporters in the country, who refuses to permit his name to enter this discussion. He went on to say that he had no fears whatsoever regarding Austria, Hungary, the Scandinavian countries or any other country—if Germany was stabilized. And he gave as the simple reason for this that other nations than Germany are losing money on their paper sent here.

How that country strikes a blow at the heart of the American paper industry is an interesting one. It was a revelation to PAPER.

It was first brought out that wood in Germany is practically stolen or purchased from the government or private persons at little or nothing. The fall of the mark has made this partly possible and the connivance of the German government, it was said, helped the thing along. Last year owing to the precipitate fall of the mark, many manufacturers in Germany bought wood from the State at 50 cents a cord. The result is that during the year she was able to flood the market at prices 30 per cent or more below the actual value of the paper. Some of these facts are verified in an article by Dr. P. C. A. Schenck, now in Germany, appearing in the Forestry Department.

The Labor Cost

Then it was explained that the labor cost in Germany is infinitesimal, a thing that is trifling. The mark has gone down, wages have gone up, but wages didn't go up with anywhere near like the rapidity the mark fell.

Furthermore there was no demand at home, consequently almost all the paper made was made for export and at prices that would leave a tremendous margin of profit for the manufacturer.

It was further brought out that instead of being economically poor, Germany is economically in a very strong position. Mortgages have been paid in marks at a tiny portion of the value when the mortgage was drawn. The industrialists have been building and extending for several years, borrowing as fast as possible and then paying off in marks that in the meanwhile dropped in value to nothing. New mills costing $10,000,000 are paid off with ten tons of paper.

In other words is was explained that five per cent of the industrialists of Germany have beggared 95 per cent. of the population, and this is the amazing shame of it all.

Above all these reasons, the German government is apparently in league with or controlled by the German industrialists and do not charge any export duty, either as a means of raising money for reparations duty or for current expenses.

Paper is made in Germany as fast as possible with the raw material costing very little and frequently stolen altogether, made by men drawing trifling wages, rushed out of the country without export duties and sent to America as fast as possible to get gold for it. Much of it is sent here on consignment to be sold at any price, and this "any price" is bound to bring a profit.

Even England protects herself against this unfair competition by levying an import duty of some five per cent.

Germany the Key

It was stated that by impossible conception can the present situation be changed until Germany is forced to meet her obligations and compete on a parity with other nations. Germany owes billions and pays nothing. There can be no permanence or hope for the American paper industry until the reparations payments are fixed and Germany acknowledges them and buckles down to pay them. And this means, it was emphatically asserted, that Germany must be made to take from her mind this little formula: "We have lost the war but we can win the peace." And one authority in the matter stated to the interviewer from Paper that the only argument the German nation understands is the bayonet.

This authority on imports and exports and who, it may be stated, has studied the matter for years, says that even a partial carrying out of the Versailles Peace Treaty would remedy the entire situation. This treaty was signed by Germany. One section provides for the collection of a 26 per cent duty on all Germany exports over and above the regular tariff, this money to be placed in a general reparations fund. The imposition of this tariff would instantaneously remedy the situation, and eliminate the present bankrupt competition.

This authority was firm in his declaration that the least this government could do was to refuse to admit German goods without a certificate that the 26 per cent. export duty has been paid, as is required by the Versailles treaty. Even though the United States has not agreed fully with the Versailles treaty, as an act of comity to the other nations it should enforce this phase of the treaty.

The imposition of this export duty would at once end the period of depression in the American paper industry, it would put German competition on an equal basis or more nearly an equal basis with this country, the Scandinavian countries and others would follow suit and charge a price for their product that would bring a profit, the German indemnity would become a reality and prosperity would follow. Such is the view.

Looking Ahead

The work of the Reparations Commission in Germany and France is being highly praised by those wise ones of the paper industry, who look far ahead. They see some hope, if the plan of the commission is carried out. The entire source of worry is now that the nations will not ratify or stand back of the plan. Without going into detail the Reparations Commission calls for a financial plan with a bank in another country than those involved in the war, which would serve the same purpose in Europe that the Federal Reserve Banks do here. The one drawback seems to be that perhaps the nations will not approve the plan and then the situation is just where it started.

There is no hope, whatever, is the opinion of these men who have studied the matter, that there can be any material improvement until Germany is forced to do business on a proper basis. For Germany, it was frankly stated, has no commercial morality. And while many of the practices of Germany in a commercial way regarding exports are not illegal they are far from ethical.

In 1913 Germany exported 327,000 tons of paper. In 1923 the figure was about 700,000. This is an increase of almost 100 per cent.

A Specific Cost

When bond paper can be imported from Germany, held here until a call comes from another land, like Cuba, and then sent to Cuba at seven cents a pound when the nearest the domestic bonds can be quoted is nine cents a pound, as has been the case, then the American paper industry is up against a formidable proposition. This, it was explained to Paper, has been done, and many similar cases. The accusation was made that bond paper has been sent here in rolls as newsprint. Reports and rumors, however, carry no weight. Before action can be taken in a legal way, the Anti-Dumping Units must have proof.

Because every possible method has been taken to get goods out of Germany so payment can be made in gold or the currency of some more stable land, as fast as the paper is made it is shipped to America and other countries. Anything to get it out of Germany, any price, any conditions—but get it away from that land where money means exactly nothing at all. The result of this attitude is large cargoes on consignment, hoping for the best. The same conditions apply to pulp.

It was brought out that the moment taxes must be paid, either internally or in the matter of exports, this unfair German competition will cease. At the present, it is not fair to labor, it is not fair to other countries. It is not fair to ourselves.

* * *

Paper Production In Pennsylvania

The State Department of Forests and Waters, Pennsylvania, has completed a survey of the extent of the pulp industry in the state, showing that $50,000,000 is invested in this branch of business in the state, with an annual production valued at $20,000,000. During the past year, a total of 235,760 tons of pulp was produced at the different mills, establishing a new record for the state. The industry employs about 7,000 persons, with annual wages and salaries aggregating $12,000,000. There are twelve pulp mills in the state, using a total of 446,662 cords of wood during the past year, or an increase of 39,630 cords over the figures of 1922. Of this amount, 70 per cent was imported from Canada or other points outside of Pennsylvania, with the other 30 per cent of pulpwood coming from the forests in the state.

PAPER BOOTLEGGERS ARE BUSY

And W. B. Bullock Is Hard At Work Trying To Catch Them

THE story of how the paper bootleggers are raining the American paper market with improperly classified entries of foreign paper will be told at the American Paper and Pulp Association convention, at the business session, Thursday, April 10, when Dr. Baker will report on the results of the Association's investigations of this subject.

Beginning with the special import conference in November, the Association has been quietly prosecuting its inquiries into the activities of the bootleggers of foreign paper, and some surprising developments have resulted.

A formal protest has been made this week against the admission as printing paper of "Made in Germany" second sheets for typewriter use, letter sized paper, wrapped and sealed in ream packages. The paper paid duty as printing paper thereby coming in under conditions which makes it impossible for the domestic manufacturers to compete with the German offers. The paper is being sold by the importers at 16 cents a ream, and an interesting sidelight is that the importers' price is so low that it is possible for New York stationers to offer this paper as a "bargain" at 35 cents a ream, and still undersell the domestic manufacturers.

The customs authorities have been given specific evidence of the dumping of Canadian kraft at prices from 1½ to 2 cents below the Canadian home market for the same paper.

The importation of parchmentized paper as wrapping has also been protested by the American Paper and Pulp Association, which some time ago announced its temporary discontinuance of its Information Service to permit Warren B. Bullock, in charge of that department, to devote his time to investigations of customs abuses.

* * *

Short News Items

The Pioneer Paper Co. has moved from 52 Japan street to 55 New Montgomery street, San Francisco, Cal.

Blake, Moffitt & Towne are about to begin construction of a four-story, 187x215 foot paper warehouse at 242 S. Los Angeles St., Los Angeles, Cal.

The Archer Paper Co. has been incorporated in Chattanooga, Tenn., with a capital stock of $150,000. by John Stagmaier, John W. Marshall and others.

The Florida Paper Mills Co., Jacksonville, Fla., subsidiary of the Grass Fibre Pulp & Paper Corp., Leesburg, Fla., is clearing right of way switch about ¾ mile long from the Florida East Coast Railway Co., and is now taking bids on steel work for the main plant, and also about to take bids for construction of this main plant.

The Mobile Paper Mills have been incorporated in Mobile, Ala., with a capital of $200,000, by Jos. M. Walsh, E. D. Angell, G. L. Smith and others, to manufacture paper and by-products.

Weight of Wood and Quantity of Pulp

Pulpmakers Seek Method of Valuing Wood by Its Weight—Amount of Moisture in Wood Influences Yield of Pulp, Capacity of Digester Being Affected

It is trite to say that wood is the most important raw material for making paper. Its quantity at the time of purchase is determined in various ways, according to its volume, cubic foot, cord, etc. The quantity of finished pulp made from this wood is always expressed in terms of weight, by kilogram or ton. The simplicity of of measuring the volume of a mass of wood, the possibility of carrying out this measurement at any place without the need of instruments, and finally the fact that a considerable part of the wood serves as raw material for sawwood, which is also part of the mass, have led to the general practice of buying pulpwood on the volume basis. No one at the present time buys pulpwood by weight.

To the pulpmaker the volume of the pulpwood is no indication to him of the quantity of wood that he has for conversion into pulp. What is important to him is the proportion of absolute dry wood substance that is available. Hence it is undoubtedly advantageous for him to buy the wood after first taking into consideration the amount of moisture that it contains. It is rather easy to determine what a solid or cubic meter of wood represents. But does it follow that the same amount of wood will always be obtained when buying on the cubic meter basis? Of course not.

Volume of Wood Varies With Its Moisture Content

The volume of wood varies, as is well known, with its moisture content. Wet wood contracts on drying; dry wood swells up when it absorbs water. Hence the quantity of wood that is purchased without any knowledge of the proportion of water that it contains, may mean an entirely different mass of wood substance than another similar volume of wood, so that its value for pulpmaking may be quite different.

This condition is generally taken into consideration in purchasing the wood by indicating whether the wood has been freshly cut or stored for sometime, and its value is then based on the practical experience that has been gained with similar wood under similar conditions. However as the amount of moisture in freshly cut wood varies and inasmuch as this moisture is subject to a certain amount of reduction on storage of the wood, the moisture content of a wood, judging by experience gained with similar woods in the past, can give only an approximate idea of the real proportion of moisture that is contained in the product.

In the accompanying article by Rudolph Sieber, which is a translation from Svensk Pappers-Tidning, 15 *and* 17, 1923, *the author brings up for consideration a subject which has been studied by American paper technologists for a number of years past. Experiments looking to a means of measuring pulpwood by weight instead of volume have been conducted by the paper and pulp section of the Forest Products Laboratory at Madison, Wis., the News Print Service Bureau and the Technical Association of the Pulp and Paper Industry. It is to be hoped that the publication of Sieber's article will lead to a re-investigation of methods which have been previously tried by workers in the United States as a basis of calculation for bone-dry wood to replace the cord system is badly wanted.*

Difficulty of Valuing Wood By Its Weight

The valuation of a shipment of wood by weighing a sample of it and estimating the proportion of moisture that it may contain is fraught with all sorts of difficulties. Furthermore, it is hardly to be expected that any change will take place in the time-honored custom of determining the value of a mass of wood by its volume.

There are, however, many reasons why it is convenient and necessary to know the weight of a unit volume of the wood. It is useful for instance in figuring the yield of pulp, and it is of importance in making calculations to determine the consumption of heat during the digestion process. The cellulose content, the proportion of other woody constituents, the specific heat and all other physical and chemical factors and characteristics are based on the unit of weight. There is still another good reason why it is necessary to know how much the wood weighs per unit volume.

Variation in Density of Wood

It is common knowledge that the density, the specific gravity (weight per unit volume) of a wood varies in accordance with its habitat, character of the soil, climate, rainfall and other conditions. On account of this it is impossible at first glance to obtain an accurate and satisfactory idea of the weight of the wood per unit volume. In fact an absolutely accurate figure, which will hold good for every case, will never be found. Nevertheless for the aforementioned purposes it is possible to use an average figure of approximate accuracy which will be satisfactory in the great majority of cases.

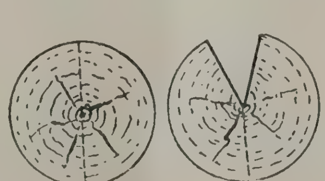

Fig. 1—Wood Sample Shrinkage

In the technical literature of the paper industry a considerable amount of data may be found pertaining to the weight of wood per unit volume. But not in all references is information given regarding the moisture content of the wood. Very often the data refers to the air-dry wood, a term whose significance is either not exactly understood, or extremely narrow in scope. A superficial study of the available figures on this subject leads to the conclusion that a value of between 0.4 and 0.5 must be assumed as the average specific weight of absolutely dry wood. In the case of trunk wood—and this is the only kind of wood that is being considered in this article—this figure seems to vary between certain limits.

It would undoubtedly be of considerable advantage to secure accurate data on the specific gravity of wood, ground under different conditions and in different climates. It is only when such values are available that it is possible to arrive at an accurate average figure which can at least be applied without any too great error to a particular group of woods, if not to all wood.

The Results of Investigations

The author made a number of investigations to determine the relation between weight and volume of wood that is used in the manufacture of wood pulp. He naturally employed wood of Swedish origin in his investigations, a pine wood. The age of the wood was between 65 and 150 years as determined by the rings of growth. The diameter of the wood was from 80 millimeters to about 180 millimeters.

(While the results that were obtained in this research may have a trace of local colors, nevertheless the net values are interesting and informative and the method employed by the well-known paper technologist may prove of suggestive value to investigators in this country. The remainder of the article dealing with this subject is reproduced herewith in somewhat abbreviated form *Trans.*)

Method Used in the Investigation

Short pieces of wood, approximately 300 millimeters long, were cut from various samples, the trunks selected being as round as possible. The samples were cut from the middle of the logs, the end pieces not being used in the testing. The samples of wood were carefully freed of all bark, and then turned on a lathe so that a perfect cylinder was obtained, the cylinder being then sawn in half in the direction of the vertical axis by means of a band saw. The half cylinders were then measured and weighed. This part of the operation was carried out with great accuracy.

The two pieces of wood were then allowed to remain exposed to the air for some time and it was noted that they lost more and more of their water content. The final drying was carried out in a drying chamber which was maintained at a constant temperature of 100° Cent. by means of a water jacket. The wood was completely freed of water in this manner, the samples being dried to constant weight.

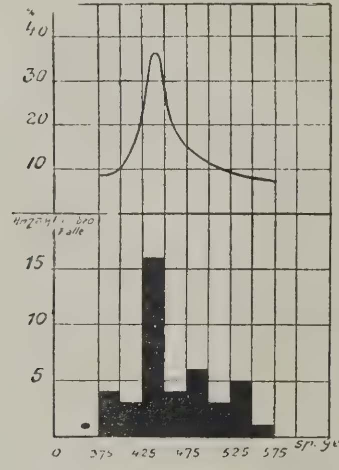

Fig. 2—Specific Gravity of Wood

In the course of the drying process conducted at the ordinary temperature the weight and the dimensions of the samples were determined from time to time. Inasmuch as the wood was tested directly after it had been taken from the water or after it had been on dry land for only a short space of time, the specific gravity of the wood determined in this manner, was somewhat less than the maximum values.

Reduction in Volume

The reduction in the volume of the wood as the samples lost moisture was also determined at the same time. Because the cylindrical pieces of wood had been cut in half, it was seen, as preliminary tests had shown, that the shrinkage in the wood did not take place through the formation of numerous fissures distributed over the entire circumference of the log. The shrinkage took place about as is depicted in Fig. 1, which indicates that there was a hollow space gradually formed in the cylinder. It is true that when the wood commences to dry out in the air, secondary fissures or cracks are formed, but these almost always close up again in the drying chamber. In the determination of the volume of the wood all the hollow spaces, in addition to the principal split in the wood, must be taken into consideration.

In this investigation the specific gravity of the wood is determined exclusively of the hollow spaces in the wood. Hence the specific gravity is not the actual density of the wood substance itself but of the mass of wood as it exists with the various hollow spaces that have been formed in it.

Results of the Experiments

The results obtained in the examination of forty-two different pieces of wood may be summarized. In the first place the accompanying curve sheet (Fig. 2) shows in graphic form how often the specific gravities of the wood fall within certain limits. In the lower half of the figure the ordinates are the number of observed instances in which certain values of specific gravity were obtained and in the upper half of the curve, the ordinates are the percentage cific gravity, the maximum value of which lies between 0.425 and 0.450 when the wood is examined in the absolutely dry condition.

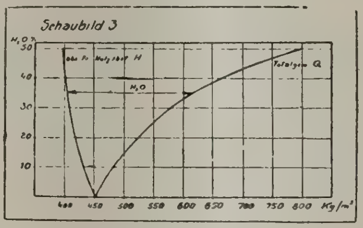

Fig. 3—Relation Between A and H

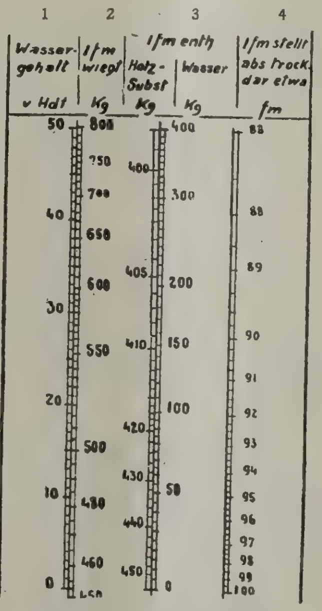

Fig. 4—Rapid Calculating Graph

The numerical values are shown in the accompanying tabulation. The figures given therein represent the averages of a number of tests of woods for moisture so that the woods are really classified according to their moisture or part of the total number of observations. The top curve shows the distribution of the observed values of spewater content.

TABLE I

Water Content in per cent.	Volume Vn. wet cubic centimeters.	Weight Qn. wet grams	Specific weight Qn./Vn.	Volume in dry condition Vt. Ccm.	Vn-Vt	Increase in volume over dry volume in percent.
42.7	37,810	26,524	0.701	33,681	4,129	12.25
36.8	47,890	28,683	0.600	43,120	4,770	11.05
33.5	44,116	27,200	0.616	39,210	4,906	12.50
27.0	58,521	32,648	0.558	52,387	6,134	11.70
22.7	95,275	86,008	0.543	86,008	9,267	9.75
17.5	93,145	48,272	0.517	86,319	6,826	7.90
14.1	21,463	10,057	0.469	20.314	1,149	5.67
1.8	8,970	4,010	0.460	8,920	41	0.46

The factors which are used in this table and the following formula possess the following significance. Vn is the volume of the wood in the wet condition; Vt is the corresponding volume of the wood in the dry condition; *a* is the increase in the volume of the wood when the latter absorbs water in per cent of its absolue dry volume; *s* is the shrinkage which takes place when water is evaporated from the wood in per cent of the original volume of the wood.

Determination of Formulas

The following formula may then be written to connect the aforementioned terms:

$$Vt\left(1+\frac{a}{100}\right)=Vn \qquad (1)$$

$$Vn\left(1-\frac{s}{100}\right)=Vt \qquad (2)$$

From these formulas expression can be obtained for *a* and *s* in terms of each other. Hence the following equations may also be written:

$$a=\frac{s}{1-\frac{s}{100}} \qquad (3)$$

$$s=\frac{a}{1+\frac{a}{100}} \qquad (4)$$

All the quantities are hence known in order to obtain the weight of a solid

---

1. Water content in %.
2. Weight of one cubic meter in kilograms.
3. One cubic meter contains wood substance water in kilograms.
4. One cubic meter contains absolute dry wood in cubic meters.

meter of wood when this wood contains a certain percentage of moisture w figured on the total weight of the wood Q as well as an idea of the weight of dry wood substance H which is contained in the wood. The equations which give this information are as follows:

$$Q = \frac{453}{1 - \frac{W}{100} \cdot 1 + \frac{a}{100}} \qquad (5)$$

$$H = Q \quad 1 - \frac{W}{100} \qquad (6a)$$

$$\text{or} \quad H = \frac{453}{1 + \frac{a}{100}} \qquad (6b)$$

In these equations both Q and H are expressed in terms of kilograms. The relation between Q and H and the percentage of water in the wood is seen from the accompanying curve (Fig. 3).

Quick Calculation of Moisture Content

It is often necessary to obtain a quick estimate of the magnitudes of Q and H, when a wood of given moisture content is being examined. Furthermore it is not at all infrequent that the pulp manufacturer is interested in the absolute percentage of water in kilograms weight in a solid meter of such wood and also in the amount of space that the wood will occupy after it has been dried.

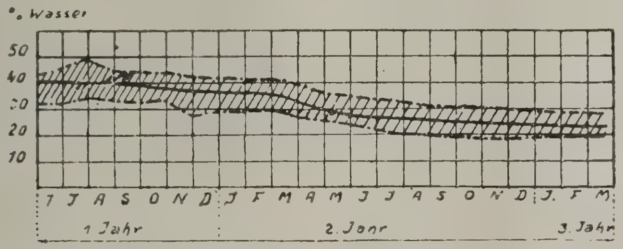

Fig. 5—Variation in Moisture of Wood

The graph shown in Fig. 4 is given as an aid in making such determinations. This will give results possessing sufficient accuracy for all practical purposes. If still more accurate results are desired, they may be obtained by using the foregoing equations.

Mechanism of the Wood Drying Process

The mechanism of the wood drying process, the different steps, and the various actions that take place are just as interesting to the pulp manufacturer as the determination of the percentage of moisture contained in the wood. This is because the amount of water that is left in the wood has considerable influence on the yield of pulp obtained per unit volume of the digester. Furthermore the amount of water in the wood entering the digester also determines the strength of the acid that is added to effect the digestion as well as the amount of heat that is required. For it is evident that a somewhat different quantity of heat is required for digesting dry wood than for treating wet wood.

It is known that the quick drying of wood is obtained only when the wood is freed of its bark layer before it is stored. Wood that is covered with a layer of bark dries out very slowly, and it is only in the process of drying when the bark shrivels up and falls off that wood begins to lose its moisture with any degree of rapidity. Naturally the moisture in the air during the season when the drying takes place is also of significance.

Water Content of Wood Floated Down to the Mill

The water content of the logs that are floated down streams to the mills is of course somewhat different and depends on the length of time that the wood remains in the water. In accordance with a series of observations made over a period of several years, wood, which is felled in the winter season and which reaches the mill at the beginning of the summer and has therefore been in contact with water for a period of one and a half to two months, gives chips which contain from 36 to 40 per cent moisture, (figured on the total weight of the wood).

If the wood is taken from the water at the end of the summer, that is after having lain in the water for a period of three to four months, then the chips that are made from this wood will contain as high as 42 to 46 per cent of water under ordinary conditions. Then again if the wood is allowed to remain in water over the winter and also comes in contact with ice during that time, the chips from this wood will contain as much as 48 to 50 per cent moisture. Higher figures for the water content of the finished digested wood from the cookers, except in certain isolated cases, have not been observed, at least so far as average figures are concerned.

Results Obtained With Pine Wood

In the course of this investigation a number of determinations of the specific gravity of the actual wood (cellulose) substance were carried out. The following values were obtained for pine wood: 1.487, 1.551, 1.512, 1.489, 1,490, 1.554. The average value was 1.54.

In the determination of the figures which have been just given and also of those which were mentioned in the earlier part of this article, it was found that when the water content of the wood was approximately 60 per cent, the wood of average character had a specific gravity of one, that is, it was just light enough to float on the surface of water. Wood of still higher water content—up to 60 per cent of the total weight— will sink in water.

The drying out of stored wood takes place in the manner described above. The accompanying curve sheet (Fig. 5) shows how the water content in the finished digested wood chips decreases as the time of storage of the wood, which is employed for this purpose, increases. Besides the average values, the maximum and minimum observed values are also shown. The data on which the curves are drawn were obtained during daily observations of the water content of wood chips which were made in the Kramfros mill. The curves show that the water content of the wood begins to decrease quickly for the first time in the second summer, and the wood attains an air-dry condition only in the second year.

Influence of Water Content of Wood on Yield of Pulp

It is known that when wood is employed in the moist condition, the yield of pulp, which is obtained per cubic meter of digester capacity, increases if other conditions are maintained constant.

It has been shown that when wood containing 40 per cent moisture is digested the yield of pulp is approximately 10.5 per cent more than is obtained with wood containing 20 per cent moisture, other conditions being equal.

Practical Experimental Figures

In what follows there are given the results of a number of experiments that were made on this subject. The experiments were intended to furnish comparative figures only. They show how, when all other conditions are maintained constant, the quantity of wood chips that can be filled into a into a space of one-tenth of a cubic water content of the wood changes. Just how far it is possible to go in the application of these figures in a practical way, for example in the determination of the total quantity of wood that can be contained in a sulphite digester, will be discussed by the writer at some future time.

The experiments were carried out in a simple manner. Wood chips which are ready for the digestion process are filled into a space of one-tenth of a cubic meter. This is always done under the same conditions, in exactly the same way and with the application of pressure which is maintained constant as far as possible. Then the weight of this volume of wood chips is determined. After the wood has been weighed, a sample is taken for the determination of the moisture content.

For purposes of calculation such tests as give water determinations that differ only a little from one another may be grouped together. The first group contains for example all those tests with wood chips, whose moisture content varies between 42 and 44 per cent. The next group contains figures which are limited at between 40 and 42 per cent moisture content and so on. In the tabulation, which follows, the average water content of tests which fall in these various groups as given in column 3. The next column contains the weight of a cubic meter of the wood chips made from wood of the aforementioned moisture content. From these two figures it is possible to calculate the quantity of absolutely dry wood that is present in the wood chips. These figures are shown in column 5 The sixth column shows the total weight of a solid meter of wood with corresponding moisture content. It is possible therefore to calculate what fractional part of a solid meter of wood chips is present in each cubic meter at a given moisture content. This means the percentage of moist wood. Finally the last column in the table gives the fractional part of a solid meter consisting of absolutely dry wood.

Discussion of the Results

The figures that are found in the fifth, seventh and eighth columns of the tabulation are expressed graphically in relation to the water content of the wood chips. The curves show that the quantity of wood filled into the unit volume increases as the moisture of the wood itself increases. The discrepancies which appear in the curves are caused by certain variations in the behavior of the wood.

Newfoundland Unfortunate

Newfoundland had an unfortunate experience in connection with her pulpwood and pit prop operations, which during 1921 and 1922, were started to relieve the business depressions and unemployment situation. According to evidence brought out before the Royal Commission investigating these and other matters on the Island, the Government lost fully $1,250,000. One witness testified that much of the wood cut disappeared before the representatives of the Government or of the purchasing contractors could take charge of it, and he thought that probably 30,000 cords had gone in this way. The cost of the wood per cord was $15, while the price realized in the final sales did not bring more than half that. The general defense of the policy is that it was launched to relieve a terrible condition of distress, and as yet no one seems to have played a dishonorable part insofar as the management is concerned.

POTDEVIN EXHIBIT AT THE EXPOSITION

To Operate a Sheet Coating Machine for Applying Glue

POTDEVIN Machine Co., in Booth 28, will operate a sheet coating machine for applying glue, paste, wax and other compositions to paper or cardboard sheets and a recently perfected machine making and printing paper bags in 3-colors.

Postage stamp bags, made in the latter machine at the rate of 100,000 daily will be distributed to visitors.

Photographs and specifications of paper waxing and paper converting machinery built to special order will also be shown. The booth will be in charge of Mr. Walter V. Hunter, Assistant to the President and Mr. Charles Schaefer, Manager of the Gumming Machine Department.

* * *

British Imports of Paper-Making Materials Increase

Gross imports of woodpulp into the United Kingdom during 1923 totaled 1,113,461 tons, an increase of 22.5 per cent over 1922 imports and of 92 per cent over 1921 imports. There was little change in the quantity of dry bleached chemical pulp received as compared with 1922, imports for the last two years amounting to 21,867 tons and 22,134 tons, respectively. Imports of dry unbleached chemical pulp, which amounted to 397,256 tons, increased 25.5 per cent as compared with 1922, and those of mechanical groundwood (wet), which comprised over half the imports, show an increase of 22 per cent as compared with 1922 and 85 per cent as compared with 1921. The greatest increases were in esparto and other vegetable fibers which totaled 216,243 tons, an increase of 26 per cent and 190 per cent, respectively, over 1922 and 1921. (Alfred Nutting, clerk in American consulate, London, January 24.)

Interallied Agreement Reached

The paper and pulp manufacturers of the occupied region of the Rhineland are to deliver, by way of reparations, to Belgium, France, and Italy during January, February, March, and April, 1924, a total of 900 tons of air-dried pulp, in accordance with specifications set forth in an agreement between their representatives and the Interallied Rhineland High Commission. In consideration of these deliveries, the High Commission is to grant immunity from seizure, except for intentional fraud, the free entry of packing cases from unoccupied Germany, export licenses, and permits to ship to unoccupied Germany in quantities based on similar shipments during 1922. Concessions are also made in the interallied tax applying to shipments destined to unoccupied Germany. (Consul Francis J. Dyer, Coblenz, January 3.)

Twin Babies Die Same Night

Paul H. and William A. Nash, twin sons of Douglas E. Nash and grandsons of the late Lewis H. and Anna Archer Nash, formerly of Brooklyn, died last week. Paul succumbed to pneumonia early in the night after being ill three hours. William then became ill, dying five hours later. The boys were born on Christmas Day. Their father is treasurer of the Nash Engineering Company.

FORMAL CALL OUT FOR CONVENTION

President Henry W. Stokes Makes Official Announcement

THE formal official call for the Forty-Seventh Annual Convention of the American Paper and Pulp Association has been sent out by Henry W. Stokes, president of the Association, and in his announcement Mr. Stokes says in part:

"There will be a business session the morning of the tenth, the President's luncheon at 1 P. M. and the banquet at night.

"All of the leading railroads of the country have granted special rate for our meetings and we hope that everyone attending our meetings will secure railroad certificate which when validated will allow reduced return fare.

"A strong and worth while program is being arranged both for the business meeting in the forenoon and for the banquet in the evening. A change is being made in the program for the banquet which, we think, will appeal to our members and their guests.

"Requests for reservations should be mailed not later than March 31. The tickets for the Annual Dinner will be $10 in addition to a registration fee of $5. The registration card will entitle holder to attend the meetings of the American Paper and Pulp Association and the Paper Industries Exposition at the Grand Central Palace.

"The usual 'zone system' in seating arrangements for the Banquet will be followed. Those in the third zone last year will be seated in the second zone this year; those who were in the second zone last year will find their places this year in the first zone; while those who occupied seats in the first zone last year will go back to the third zone this year."

Have Handsome Exhibit

The Crown-Willamette Paper Company paper mill at Lebanon, Oregon, placed an exhibit in the Educational Exposition held in February at the Oregon Agricultural College in Corvallis, Oregon.

The exhibit which was housed in a booth made of cedar shingles manufactured by the Super-Shingle Company of Lebanon, consisted of a white fir block of wood and samples of the wood taken from each phase of the changes it would undergo in the process of making wrapping paper.

The Lebanon exhibit attracted considerable notice at the exposition and it was awarded the third prize.

* * *

New Paper Mill in Sweden

The Korsnas Saagverks A.-B. will in the near future, according to dispatches from Sweden, start operations on the construction of a paper mill near Karskar with a capacity for annual production of 4,500 tons of wrapping paper. It is expected that the mill will be finished in July, 1924. Further, it is reported that plans are being considered to build a new sulphate pulp mill in Sandviken in the Hernosand district, with a calculated yearly capacity of 15,000 tons. No final decision has, however, as yet been taken. (Acting Commercial Attache Harry Sorensen, Copenhagen, January 21.)

Power Transmission by Belting*

Superintendents Hear Splendid Discourse on Important Subject at February Meeting

By J. E. RHOADS

THE keen competition which is so universal in all lines of business makes necessary careful study and vestigation of production costs. One the most effective ways of cost reection is through increase in producon. Economizing of power is another ctor which in certain industries is of eat importance.

I want to also attempt to explain ne of the principles entering into wer transmission by belting, whether be of leather, rubber, canvas or other terial. There are perfectly proper d legitimate uses for nearly every nd of belt and there are a few types drives where leather belting will not rk as satisfactorily as rubber or some ner fabric. They are usually either nveyor drives or transmission drives ere the belt is subject to strong acid, ong alkali or some other chemicals which leather fiber is not resistant. was long thought that leather belts re unsuitable for wet conditions, but ce the use of thoroughly waterproof nent and proper methods of treatnt leather belts run in all kinds of t conditions with satisfaction and nomy. Where oily conditions are t with leather belt of the right kind s proven to be the best thing. It y be said in a general way that the blem of the engineer is first to den his drives so that they will be reaably economical and then to choose type of belting best adapted for the ditions.

Power transmission by belting had been carefully studied until within last few years. As you look at a t pulling hundreds of horse-power oothly and effectively year in and r out the problem appears a simple . A little study, however, shows t there are a lot of factors involved. e scientific work done by individual nufacturers and others has been ed at finding out, by actual test, the ct of these various factors. Of se some are inherent in the belt it-, such as the nature of the surface, width and thickness, the weight or sity, the flexibility of the belt, its ticity, its resistance to stretch, and strength. Another group of factors e to do not with the belt itself but n the conditions under which it is rated. In this group are included speed of the belt, the tension under ch it is run, the arc of contact on pulleys, the kind of pulley used and humidity and temperature prevail-. All of these variables have their ing on the amount of power the belt will transmit and the efficiency with which it will do it, or on its durability.

AN EDUCATION

Because Mr. Rhoads knows his subject thoroughly and because there are tremendous losses in mills owing to the improper power transmission by belts, this is a story that should be carefully read by every man in the mill from the president down. Mr. Rhoads is a manufacturer of belting, but to read the article you would think he is merely a power engineer. He handles his subject both impartially and profoundly. There is a real possibility that what he says may save any mill money. So don't overlook this article.

The Surface

First let us consider the nature of the surface. It is one of the most important factors for upon it depends the friction on the pulley. An efficient leather belt has a surface with a tacky, clinging quality. It is not slippery and is not usually highly glazed. On the nature of this surface depends largely the difference in behavior between leather and fabric belts, the better grades of rubber and cotton belts will work fairly well up to a moderate load while any appreciable overload causes them to slip badly, though this sometimes is not noticed because they slip without jerking. An accurate speed counter will, however, prove the loss when they are slipping and the power loss is directly proportional to the slippage. There is something about the surface of a good leather belt that enables it to stick to its job, when an overload is applied, without undue loss of power or what is much more serious, loss of output.

To compare the surfaces of different belts we measure the coefficient friction. If a belt of leather or any other material be laid on a flat table and a block of smooth castiron placed on its surface and attached to a spring balance, the pull required to slip the block on the belt can easily be measured. The coefficient of friction is the ratio of this pull to the weight of the block. If the block weighs 20 pounds and it takes a five pound pull to move it the coefficient of friction is five-twentieths or .25. A better sample of belt might require a 10 pound pull and the coefficient of friction would be .50. This value does not depend on the area of contact, but as between leather and iron it does depend not only on the surface of the leather but also on the speed of slipping. This curious fact is largely accountable for the leather belt's property to carry overloads, it is not possessed in like degree by fabric belts. With leather, as the slippage increases the gripping power also increases.

The Need of Width

The statement above, to the effect that the amount of surface in contact does not effect the grip, would lead one to suppose that a narrow belt would carry as much load as a wider one. In practice this is impossible, or at least inadvisable because the narrower or thinner belt cannot, over a long period of time, maintain the tension necessary to carry the heavier load. In theory, however, it is possible and we have proven it in our laboratory in two very interesting ways. First, with a belt having a very irregular surface, so irregular that less than half of its area touched the pulley. It carried just as much load as a belt of the same type with a smooth surface. In the other experiment we devised a means of testing a certain belt carefully, having the whole surface or width in contact with the pulleys and then removing half of the surface with a very small reduction in the cross section of the belt. By maintaining the same tension and speed the belt with only half of its width in contact with the pulleys carried exactly the same loads, at almost exactly the same slippages, as were shown by the first test, when the whole width was in contact with the pulleys.

Belts May Stretch

The tendency of a belt to stretch is very undesirable when excessive and we will distinguish it from the natural elasticity. This may be very small at the tensions ordinarily used but it may have an important bearing. A belt is thrown onto the pulley, or put on with clamps, at a tension, let us say of 36 to 40 pounds per inch of width per ply for each strand. The tension on both strands is equal, when the pulleys start to turn and the load is applied the belt must have a tight and a slack side, the difference in the tensions of these two sides is the effective pull and that is what transmits the power. As the elongation of a given portion of belt depends on the tension it is obvious that the belt is stretched more on the tight side than the slack side. A section of belt is then longer when passing onto the driving pulley than when passing onto the driven pulley. The contraction occurs chiefly on the driving pulley just before the belt leaves that pulley and the elongation occurs on the driven pulley just before the belt leaves it. This behavior is called creep and as the load increases on a given belt the amount of creep increases and the fibers on the surface of the belt creep over the pulley surface through a larger part of the arc of contact. With normal loads and an efficient belt this creep usually amounts to one and one-half per cent, with overloads it is higher. When a point is reached at which all of the surface of the belt in contact with a pulley is traveling at a speed slower than the pulley surface we have real slippage, as well as creep. It is natural that some belts will creep less for a given load than others and when they do they either save power or increase production, or both.

---

*Given before Superintendents Association, nazoo, Mich., February 2.

Another factor of the greatest importance is belt speed and the power transmitted by a given belt is nearly proportional to the speed up to about four thousand feet per minute. It would be proportional at all speeds were it not for the effect of centrifugal force. Centrifugal force tends to throw the particles of the belt away from the pulley, when passing over it, thus lessening the tension which holds the belt to the pulley and lessening its capacity. As this force is proportional to the square of the speed it is obvious that if the speed is doubled there will be four times the tendency for the belt to fly away from the pulley. With belts of ordinary density this force becomes so great that at speeds above about fifty-five hundred feet per minute the power actually lessens with further increase of speed, unless the belts are re-tightened to what are excessive initial tensions. As the centrifugal tension varies with the weight of the belt it is desirable, other things being equal, to use belts that are light for very high speed drives.

An Example

To waste a minimum of power in friction on bearings it is clearly desirable that the required effective tension be obtained with the least possible tension in the two strands of belt. For instance, to transmit one horsepower at a belt speed of one thousand feet per minute requires an effective tension of 33 pounds. You may have one belt that is tight or inefficient with a tension on the tight strand of 45 pounds and on the slack strand of 12 pounds, giving a difference of 33 pounds. This gives a pull on the bearings of 57 pounds. Another belt of high efficiency may have a tension on the tight strand of 2 pounds and on the slack strand of 35 pounds, or a total on the bearings of 37 pounds. This would give only about 65% as much loss in bearing friction as the former belt. In tests we have had a ratio of more than one hundred to one in the tension of the two strands. This, of course, is abnormally high, but indicates what may be possible.

The effect of arc of contact is striking, the power delivered being about proportional to the arc of contact up to one-hundred eighty degrees and beyond that point increasing at a somewhat lower ratio. It is, however, very desirable to secure as large a contact with the pulleys as possible. The newer type of gravity binder drives are most useful for accomplishing this, especially where center distances are short and pulleys very unequal in size.

The Matter of Tension

Tests have indicated that where the tension is applied to a belt of given thickness, in proportion to its width, that the horsepower will be also proportional to the width, under similar conditions of speed. The natural flexibility of a belt effects the ease with which it bends around small pulleys and the thickness, of course, enters into this too. Naturally the thinner and more flexible the belt the less will be the power lost in internal friction and the better will be the contact on the pulleys, especially if they are of small size. Rubber and canvas belts as a rule do not compare favorably with the best leather belts in this respect. Their surface usually is better when they are new and often hardens or loses some of its pulling power with age. With leather belts, however, the pulling power often improves for some time and maintains a high efficiency through a very long term of service. Maintenance of this quality is of the greatest importance. The test of time on thousands of drives has proven to many of the largest companies and engineers that for efficiency in power transmission and economy per unit of output there is nothing like leather.

There are certain types of punch presses used in sheet metal work which give the operators much trouble from slipping belts and this is true whether rubber, canvas or a cheap grade of leather belt is used. If the slippage is stopped a very great increase in production is possible because that slippage occurs just at a critical time in the stroke of the machine. One plant reported an increase from twenty-five hundred pieces per machine daily to forty-nine hundred pieces after putting Tannate belting on. Due to the same property a very large Southern plant making hard wood maple flooring increased their output on their Woods flooring machines from about seven thousand feet per day to about twelve thousand feet per day. You know that if a rubber belt gets wet it will not pull and this is a great cause of lost production. The Tannate under almost soaking wet conditions is practically uneffected and in fact our very careful tests have shown that after soaking
teen hours in water it will, under i
tically the same conditions, pull t
or four times the load that a ru
belt will under the same tension
speed. Its increasing use for p
mills and other wet places is an i
esting confirmation of the value of
property and even for screen diaph
in pulp mills it has given most rem
able service, as compared with ru
This condition is about the wettest
that can be found.

How English China Clay Is Produced

Necessity for Care in Mining and Preparation of English China Clay Is Dwelt Upon at Length

By S. P. BUNN

Grant's Walk, St. Austely, England

IN recent years there have been many improvements introduced into the production of china clay, the most important to papermakers being those having for their object the improvement of the finished article. A factor that has always contributed to the cleanliness of English china clay has been the existence of an abundant supply of water in the china clay mines of Cornwall and Devon, the thorough washing of the china clay with clean water having always been one of the essential processes in the production of the commodity.

The English virgin clay is never of so hard a character that it cannot be broken up by streams of water, and the fact that any impurities in the virgin clay are capable of extraction by gravity without the introduction of any chemical processes, account to a large extent for the retention of the qualities peculiar to English china clays which are not possessed by the clays of other countries.

Through the subjection of English china clays to the cleansing qualities of water from the time it is separated from the quartz crystals and sand in the pit to the time it is placed, in a muddy consistency, on to the drying pan of the kiln, there is little chance of any outside impurities finding their way into the product. True, there are degrees of purity in the finished article according to the extent of the process of elimination of foreign matter, which is, more or less, according to the extent of the refining troughs, or "micas," over which the china-clay passes in suspension to the settling tanks.

For the papermaking and bleaching clay trades, the degree of refinement is higher than is necessary for china clay intended for the china and porcelain trade, china clay for papermaking particularly, having reached a high standard of perfection.

A High Standard

A still higher standard of purity and refinement than is secured by the ordinary process of washing and gravity, has been secured in recent years by the introduction of mechanical chemical and electrical proceses, which turn out what is known as colloidal clay. This product is very much more expensive to produce than the ordinary china clay and is used for special purposes, in the papermaking, soap, alum, ultramarine, rubber, and other trades which require a clay of a highly refined character. There are three processes by which this very fine quality is secured: one by means of grinding mills, which reduce the china clay to a very fine powder; another process produces a very fine quality by the introduction of chemicals into the clay after it has passed into the settling pits; and a third in which the elimination of all coarse matter and the conversion of the clay into a very pure state is secured by an electrical process.

The English china clay industry has developed very considerably on the scientific side since 1914, and the success of the scientific investigation and research that has been going on during this period has produced results which are not only enabling the industry to recover old markets but to extend its sphere of business. Especially is this the case in the various branches of the papermaking industry, for now it is possible for china clay suitable for the papermaking industry, and actually being used in papermaking, to be sold from 26/- per ton, F. O. B. Fowey, up to £3, £4, and £5 per ton, according to its filling, bleaching, and coating qualities and the expense of the various processes of refinement to which it has been subjected.

The strength of the English china clay industry, despite depressing factors in Europe that have prevented the recovery of markets to the pre-war volume, is seen in the total deliveries made in 1923 of 820,393 tons, compared with 737,486 tons in 1922, and 864,369 tons in the best post-war year of 1920. The growth of the American markets for English china clays, especially for papermaking, has largely contributed to this highly satisfactory result. Such is the spirit of optimism that prevails, that 1924 is expected to beat all records, since 1912.

Waste in Pulp and Paper Industry

The Pacific Coast

By B. T. McBAIN

Assistant General Manager, Nekoosa, Edwards Paper Company

THE writer just returned from a trip over the entire American Pacific Coast Pulp and Paper Manufacturing Territory; he found business in general very good and some of the mills running even parts of Sundays to keep up with their orders. He found considerable foreign paper coming into the various ports and a very considerable lowering of prices today compared with Eastern prices as in earlier days when Western prices were very greatly governed by Eastern prices and the freight rates.

He found mills being built, old mills being rebuilt, and general evidence of prosperity in the industry.

He also found new mills being built on paper on almost every corner, figuratively speaking, and each and every one expressing confidence that their particular new mill would be built.

But what he found of greatest interest was the keener interest being taken in the conserving of their natural resources and in the Saving of Waste. Mills which in the past were wasting everything are now installing save alls of various makes and designs to stop the waste from the bunghole where before they were only seeing what dripped from the spigot.

Mills which heretofore refused to use small logs are either equipping or have already equipped for handling the smaller pulpwood always wasted in the past.

Mills where four men have been employed per ton of production are seeing the error of their ways and putting in labor saving devices.

Why? New mills built on the Coast, designed by people heretofore unknown on the Pacific Coast, are proving to be competitors of the real sort and are not only making paper with two or even less men per ton, but are producing a better sheet at considerable lower cost.

Mills heretofore keeping their executives at home and hardly taking the trouble to read the Pulp and Paper Trade Magazines, some even cancelling these publications in an effort to save money, false economy to be sure, are now regularly sending these men of high caliber over the papermaking districts of the United States to gather such additional data as they may to economize.

These are the things he was most pleased with—the evident desire, if not need, for saving Waste—Waste in everything from wood to transportation.

The Story of An Utopian Mill

It Sounds Impossible But it is True in the Grandfather Paper Mill at Merrill

By EDWIN C. HART

A PAPER mill operated on the golden rule plan! Thus they speak of the Grandfather paper mill at Merrill, Wis. The Grandfather Company's plant may not boast of a record in the output of paper, nor in value of its holdings, nor in the number of employees, but those connected with the company will challenge any mill in the country to show a better espirit de corps.

One hour and thirty minutes after the spruce logs, which are piled high on the banks of the Prairie River, have been shunted into the peeling room of the Grandfather mill there emerges a product of white material on which dreams are made. This substance is newsprint, and what may be imprinted on its surface is only rivaled in interest by the story of its making—the inseparable stories of Grandfather mills and of William J. Sullivan, their manager for nineteen years.

In this mill capital and labor work hand in hand in such harmony that professional strikers failed to make one man stop work during a strike that closed all other timber industries in Merrill. And in this mill, which does not know the meaning of an industrial relations committee as such, one man is given the credit for this unusual loyalty. "Bill" Sullivan is so interested in his 65 fellow workers that he feels hurt if one of them does not report the birth of a son to him.

What "Bill" Says

"We fight for our men, and they fight for us," says Sullivan. "Though we like to hire young men, we feel that an old man's loyalty is just as valuable to us as it was when he was a young ox for work, and we don't believe in turning them out on a pension. I will tell you why our labor turnover is practically nil and why we discharge perhaps one man a year.

"The mill must go on. To this end we have two shifts working twelve hours each and though the men set their own pace and hence are not subject to what the sociologists call 'fatigue of forced spirits' we have an additional crew which cuts in regularly and gives everyone a weekly layoff.

"If I go out into the paper room the men do not jump up and start madly polishing the brass. If they are sitting down they are doing so because they have performed a job requiring great skill in a snappy manner and they can judge to an instant when their attention will be needed again at the machine. They and I both know that 'soldiering' is unknown in our mill. It's like hiring a bunch of high school boys to shovel the snow off your walk; they fool around a lot, maybe, but they get the job done quicker than one of your so-called steady workers.

"As Ellis Parker Butler says in a recent article in the *American Magazine*, "Get into the right rut—then stay there, but don't forget the oil!' The oil he is speaking of is play."

This absence of any spirit of being driven naturally results in the highest type of work. There is no such thing as a night boss and the mill runs merrily on turning out 500 feet of paper ten feet wide every minute.

The Vacation Plan

"Instead of firing a man," continued Mr. Sullivan, "we tell him to take a vacation for a day or a month. The walk home from the mill and the clear thoughts that come during the vacation generally are all the discipline we need.

"One year we had to run on the Fourth of July. We asked for volunteers. Two youngsters gave their word that they would work—but when the band began to play they disappeared. It wasn't only that it embarrassed the company with important work to be done, but they had given us their word and they had broken it. So I put them out for one year's vacation.

"Toward the end of that period they would drop around at the office and tell me, 'Two more months, Bill and we get our jobs back again.' And on the day, one year after they had been discharged I hired them again and they have justified my faith."

When the timber cruisers' union struck for the eight hour day instead of the existing ten hour period, the men at the Grandfather mill who were working twelve hours refused to strike. Most of them joined the new union and Bill Sullivan saw to it that they kept their dues paid up, but the strike never entered the precints of Grandfather, although other mills shut down all summer.

Later the men organized an association among themselves which charges the same dues and whose protection covers all that the state accident compensation law covers, and in addition any misfortune that may be met with outside the mill.

Life Insurance Policy

When a man comes to work for the Grandfather mill he is given a life insurance policy for $300 at the end of three months. Every year he remains with the company his policy is increased $100 in value until a maximum of $1,000 is reached in seven years. This is a form of bonus which the company finds very popular.

A friendly attempt is made to have all the men own their own homes.

"Give me a home owning class of workmen and I defy red Bolshevism to touch them," said the late Randall Parrish. Bill Sullivan has been putting this principle to work for him for many years. Not only do most of the men own their own homes in Merrill, but all of them have A-1 credit rating in any of the stores in the city.

A story to illustrate the problems that confront an employer of men is told by Mr. Sullivan:

"I heard that a certain employee of ours had no more credit down town. So I called him into my office and learned that his wife was extravagant and spent more than the pay check brought in. She was a very poor manager, kept no sort of budget or expense record, but just bought frosted cookies and finest butter and fancy shoes with no thought of the mounting bills. I asked her to come down to see me.

"When she came I explained to her that our men must have a good name in the stores. Then I said:

"'I am going to manage your hom one month. You will not even know you are going to have to cook for di each day. I will do all the orderin telephone each day and your husband give me his pay check. If you want thing you must come and ask me for

"The month rolled along. The r kids in that family probably ate more meal than ever before; they had gi snaps instead of ladyfingers, dairy b instead of fancy creamery. If a boy ne a pair of shoes, Mrs. X brought him d to my office and I told her to go and the ones he had repaired.

"Thirty days later when I handed what I had saved out of that mon check to the husband, they both refuse believe it. They really hadn't believed their large family could live on suc small cash outlay. Best of all, they it and since then the wife has taken in managing her home on a better busi basis.

"I suggested that they buy a home, s time later, but they both laughed at I persuaded them to start buying it on easy installment plan and before they it paid for they sold it for a nicer hon which they own today. Those are the of men we are proud of. Men of fam who pull together."

Appeals to Pride

Another way that this economic wi keeps the men turning out 32 tons of p a day is the careful stimulus given man's pride in his skill.

During the war automatic devices changing the rolls, winding a lead, had to be installed, but as soon as regular staff of men got back on the they took out those automaton-working vices. A man who possesses a knack a skill to work with his hands is too uable to turn into a mere machine ten the owner claims. This dexterity also tects the men in making it easy for t to get a job if they ever go to ano mill where these automatic contriva are not in use.

Other up to date methods in the Gr father mill are seen in the safety gua machinery and more especially in the trically operated grinders. This was a step in the manufacture of paper and be credited to this mill. Hitherto grinders had been attached to the wa wheel, but as the power plant for Grandfather plant is 14 miles away, e tric transmission of power was the feasible scheme.

The company, which was organized years ago, still is capitalized at $300, but it would be difficult to estimate value of the good will which its mana ment has built up.

* * *

To Make Paper Boxes

The Fall River Paper Box Company, River, Mass., recently organized, will ma facture paper boxes on a nominal scale. company is headed by Alexander Shapiro.

The Paper Mill Superintendent Dropped into the Sales Manager's Office—

"Charlie," he began, "just what do you think the Paper Exposition is worth to us—what can it do for us?"

On the desk lay an announcement of the

— SECOND ANNUAL —

PAPER INDUSTRIES EXPOSITION

Grand Central Palace, New York — — Week of April 7th

"I think," said the Sales Manager emphatically, "it is worth thousands of dollars in money—worth the most careful plans for an extensive exhibit—worth sending as many of our people as we possibly can to attend for several days. I think it will show us scores of ways to do better work—put out better products, and at the same time cut down production costs."

"That's quite an endorsement, Charlie" said the Superintendent.

"I spent the entire week there last year, and you know," the Sales Manager smiled significantly, "I've been promoted here twice since then."

"I see the point. What applies to you personally can apply to the organization as a unit, eh?"

"Exactly. The manufacturing department will get new ideas about the handling of materials, the latest machinery and equipment, processes—in fact about every single operation in the plant. It certainly is thorough. The sales department will establish desirable contact with the very people who make our success possible—buyers of paper who attend in great numbers. An attractive exhibit, featuring our products, places us definitely, in the minds of those people, among the leaders where we belong."

"Have we contracted for space."

"We have. I saw to that."

"Good. I'll see that all the boys go. And say young man," the Superintendent smiled, "I'm going to be there myself. I'm not going to let you fellows edge in ahead of me!"

The Paper Exposition Is to Be on the Main Floor of the Grand Central Palace This Year.

Write for diagrams, cost of space and all particulars.

PAPER INDUSTRIES EXPOSITION Grand Central Palace, New York City

The Editorial Page

A Suggestion to Congress

WERE the honorable legislators of the United States Government not so deeply engrossed in the favorite indoor sport of operating the mud-guns and assailing men's reputations, they would have time to heed the suggestion made in this issue of PAPER to help the paper industry of America.

For it contains a suggestion that has tremendous importance.

As far as can be learned no suggestion has ever been made before that the enforcement of one clause of the Versailles Peace Treaty would change the entire outlook in the American paper industry—as well as in various other industries.

The simple carrying out of that treaty in this respect, means prosperity for the industries of England, America and France, it means that reparations would be paid, that Germany would be forced to acknowledge her obligations and that she would be forced to compete almost on an equal basis. It sounds too good to be true.

The most dogmatical critic must admit that Germany is the key to the situation as regards paper. Her present method of doing business is threatening to financially injure other European countries which are forced to sell paper and pulp at a loss to get rid of their product.

She has refused to face her obligations. She is trampling down her own labor. She is not taxing herself as she should. She is simply endeavoring to win the peace.

The imposition of the fair and just collection of the 26 per cent. authorized by the Versailles treaty, which would go solely for the payment of reparations would on paper alone be a mighty item. As long as that tax is not placed, as long as Germany is allowed to compete with bankrupt methods, methods that are not ethical or businesslike, there is no hope for improvement in the paper industry in America. Our imports will consistently and greatly increase. The exports will go down instead of up. It is not encouraging for the average forward-looking paper manufacturer.

If Congress could pause in its daily occupation and could spare a minute to think along this line, it would see the fallacy of the present situation. It would see that no American industry could compete with Germany, without a tariff wall, or some guarantee of safety.

It isn't as if the American paper industry fears all foreign competition, even though tariffs seem to be far from equable in the various industries. The average foreign competition is not feared. America is willing to take her chance with Norway, Sweden, South America, England, France and other countries. But the situation in Germany is so peculiarly a war situation, an impossible bankrupt situation, devoid of principle or common sense, that America cannot compete. America must buy her wood to make into pulp, America must pay not only fair, but high wages to her workmen to do the labor, America must pay high freight rates to transport it to its destination. There can be no parallel whatever. And, therefore, America cannot successfully compete with Germany.

And who would want a condition in this country whereby she could compete? America doesn't want labor to work for little or nothing. America doesn't want to buy or sell her timberlands for nothing or a meagre trifle. America, collectively, wants fairness for all.

Consequently the entire problem resolves itself down to the suggestion of the 26 per cent. tax to be paid towards reparations. Under this plan Germany could still export paper, but Germany could not sell paper at prices that make America's prices look fantastic and exorbitant.

As a suggestion it looks distant and ephemeral. If Congress would take it seriously, the whole world would take it seriously and one of the most progressive and sensible steps that has been considered since the end of the world war, would be taken.

But, after all, we suppose it is too much to expect. Congress is too much of the earth, earthy just now.

CONSTRUCTION NEWS

A Summary of Vital Facts Regarding Construction, Finances and Operation of Paper Mills

Brooklyn, N. Y.—E. J. Trum, Inc., 55 Third Street, manufacturer of paper boxes and containers, has completed plans and will soon break ground for a new plant at 764-76 Fourth Avenue, to be three-story, 100x150 ft., estimated to cost approximately $125,000, including equipment. William Higginson, 15 Park Row, New York, is architect.

Seattle, Wash.—The Puget Sound Pulp & Paper Co., has tentative plans under consideration for the construction of a new plant on site near the city, to consist of a number of units, with machine shop, electric substation and other miscellaneous buildings, reported to cost close to $4,500,000, with equipment. Negotiations are under way with the city for power supply from the municipal system.

Chattanooga, Tenn.—The Tennessee Paper Mills, Inc., is pushing construction on its new power house and expects to have the structure ready for service in the near future. The installation will consist of coal-pulverizing machinery, in addition to regular station equipment, and boilers will be arranged to use fuel of this character. The electrical section will be composed of two 500 kw. direct-connected generators, with auxiliary apparatus. The plant will cost approximately $75,000.

Godbout, Que.—The St. Regis Paper Co., will soon commence the construction of a new hydroelectric generating plant, estimated to cost in excess of $125,000, including machinery. A local site has been secured. It is said that contract for general construction will be placed at an early date.

Norwich, Conn.—The Atlantic Carton Corporation, manufacturer of paper cartons, containers, etc., has acquired local buildings heretofore occupied by the Shetucket Co., manufacturer of textiles, and will use it for a new plant. The property consists of several mill structures, with power house, and will be remodeled and improved to accommodate the new industry. It is proposed to remove the present works to this location and install considerable additional machinery for large increase in capacity.

Jacksonville, Tenn.—The Old Hickory Paper Co., recently organized to take over a portion of the local Old Hickory powder plant of the Government, is reported to have plans in progress for a number of new units, to cost in excess of $500,000, including machinery and operating equipment.

Chicago, Ill.—The J. W. Butler Paper Co., has leased property at 163-69 North Market Street, consisting of an entire building, totaling about 65,000 sq. ft. of space, and will use for expansion. A number of improvements will be made to accommodate the business.

Brooklyn, N. Y.—Fire recently damaged a portion of the machinery and stock at the plant of the E. W. Paper Novelty Corporation, 239 Alabama Avenue. The estimated loss has not been announced. The departments will be replaced.

Buffalo, N. Y.—The Cellophane division of E. I. du Pont de Nemours & Co., Wilmington, Del., recently organized to manufacture special paper products, has active construction in progress at its new works, comprising a portion of the property used for the fibresilk branch of the company, River Road, Buffalo. The machinery installation is under way and a large force of mechanics is being employed. It is expected to have the new mill ready for service in the near future.

Hartford, Conn.—Fire recently damaged a portion of the building of the Cole Wall Paper Co., 148 Church Street. The estimated loss has not been announced. It is planned to rebuild.

Eau Claire, Wis.—The Dells Paper & Pulp Co., is closing miscellaneous contracts for completion of its new two-story mill, 80x100 ft., including roofing, steel sash, etc., and plans to have the structure ready for occupancy at an early date. It will cost about $400,000, including machinery. L. A. DeGuere, Wood Building, Wisconsin Rapids, Wis., is architect and engineer.

New Orleans, La.—The New Orleans Corrugated Box Co., Inc., has awarded a general contract to Joseph Framherz, New Orleans, for the construction of a new building at Burdette and Oleander Streets, to cost about $17,000. It will be used for warehouse and general distributing service.

Merritton, Ont.—The Niagara Falls Paper Co., Toronto, has preliminary plans in progress for the construction of a new local pulp and paper mill, consisting of a number of buildings, machine shop, power house and auxiliary structures, with reported cost placed in excess of 350,000, including equipment. It is proposed to commence work during the summer.

Newport, R. I.—The Newport Carton Co., is perfecting arrangements with the Industrial Development Co., for the construction of a new plant on the Commercial Wharf, to be occupied under lease. It is expected to cost about $30,000, including equipment.

Louisville, Ky.—The Kentucky Waste Paper Co., is reported to be perfecting plans for the reconstruction of its local building at 915 North Thirty-sixth Street, recently destroyed by fire, with loss estimated at $35,000. The new structure will cost approximately a like amount.

Middletown, Ohio—The W. B. Oglesby Paper Co., has taken bids on a general contract for the construction of a new three-story and basement plant building, 100x100 ft., to be equipped primarily as a heater and rotary unit. A portion of the structure will be reserved for storage service. It is estimated to cost close to $100,000, with equipment. Thomas H. Scott, P. A. Sorg Building, is architect.

Port Arthur, Ont.—The Nipigon Corporation is planning for the early purchase of machinery and operating equipment for a pulp and paper mill, reported to cost in excess of $300,000. C. W. G. Gibson, 80 Homeward Avenue, Hamilton, Ont., will be in charge of purchases.

Port Huron, Mich.—The Dunn Sulphite Paper Co., recently organized with a capital of 10,000 shares of stock, no par value, is having plans prepared by Billingham & Cobb, 404 Press Building, Kalamazoo, Mich., engineers, for its proposed local mill, to consist of a main unit with auxiliary structures, equipped for an initial output of from 15 to 18 tons per day. It is expected to call for bids at an early date. It will cost approximately $275,000. The new company is headed by Charles F. Clippert, R. G. Lambrecht and Charles F. Bornam, 680 Delaware Avenue, Detroit.

Eaton, Ind.—The Eaton Paper Co., is considering tentative plans for the erection of a new one-story building, 60x150 ft., to be used for distributing and warehouse service, estimated to cost about $23,000. Merle Peck is company architect.

Oakland, Cal.—The Globe Register Co., 2412 Reading Road, Cincinnati, Ohio, manufacturer of blank books, business registers, etc., has acquired property on Horton Street, Oakland, as a site for the construction of a new plant for Pacific Coast trade. Plans will be drawn at an early date, and bids asked. The estimated cost is reported at $50,000, including equipment.

Bogalusa, La.—The Union Bag & Paper Corporation, Woolworth Building, New York, will commence the immediate erection of its proposed new local plant for the manufacture of paper bags, containers, etc. It will consist of a number of buildings. The company purposes to secure paper for production from the local mill of the Bogalusa Paper Co. It is expected to have the new works ready for service late in the summer. It is said that an appropriation of close to $200,000, has been arranged for the plant.

Lewiston, Ida.—The Chamber of Commerce is in negotiation with a company which plans for the construction of a pulp mill in this vicinity, whose name is temporarily withheld. A site is under consideration. The plant is expected to cost in excess of $150,000, with machinery.

Bridgeton, N. J.—The Illinois Glass Co., will commence the erection of a new building at its local plant for the manufacture of paper boxes for company service, as well as for other similar works in this section. It will cost about $80,000, with equipment.

Albany, N. Y.—The Albany Perforated Wrapping Paper Co., has plans under way for the construction of a pulp mill on tract of timber property, totaling more than 55,000 acres, recently secured at Sheet Harbor, N. S. The mill will consist of a main unit and auxiliary structures, with power house and machine shop, and is estimated to cost approximately $260,000, including equipment. It is expected to commence work during the spring.

Philadelphia, Pa.—The G. A. Bisler Co., Inc., 245 North Sixth Street, manufacturer of paper boxes and containers, has filed plans and will commence the immediate erection of its proposed four-story plant addition at Fifth and Brown Streets, to be 135x146 ft., estimated to cost approximately $208,000, with equipment. A general contract has been awarded to the William Steele & Sons Co., 219 North Broad Street.

Philadelphia, Pa.—Edward D. Hemingway, head of the Hemingway Co., 243 Elbow Lane, paper products, has taken title to the four-story factory at 828-30 North Hancock Street, and will use the structure, it is stated, for enlargements in the plant. It aggregates 37x105 ft., and has heretofore been held by James E. Smith.

New Companies

Newark, N. J.—The Regal Card & Paper Co., has been incorporated with a capital of $50,000, to manufacture paper products. The incorporators are Benjamin Silber, A. and Samuel W. Bloom. The company is represented by Jacob I. Kaplan, 21 William Street, Newark.

Needham, Mass.—The Moineau Box Co., has been incorporated with a capital of $25,000, to manufacture paper boxes, etc. Alderic I. Moineau is president; and Edrick S. Tucker, Needham, treasurer.

Baltimore, Md.—The District Waste Paper Co., 445 Guilford Avenue, has been incorporated with a capital of $35,000, to deal in waste paper. The incorporators are R. Walter Crothers, Harvey O'Connor and William E. Mantz, Jr.

Brooklyn, N. Y.—Rothenberg & Kornfeld, Inc., has been incorporated with a capital of 60 shares of stock, no par value, to manufacture and deal in paper products. The incorporators are M. Rothenberg, S. Kornfeld and A. L. Salkin. The company is represented by Bernstein & Salkin, 52 Broadway, New York.

Brooklyn, N. Y.—The Paper Package Co., has been incorporated with a capital of $10,000, to manufacture paper specialties. The incorporators are S. Levy, S. Hoffman and B. Horowitz, 2916 West Thirty-sixth Street, Brooklyn.

Chattanooga, Tenn.—The Archer Paper Co., has been incorporated with a capital of $150,000, to manufacture paper products. The incorporators are John W. Marshall and John Stagmaier, both of Chattanooga. The last noted is president of the Tennessee Paper Mills, Inc., now operating a local plant.

Newark, N. J.—The New Wall Paper House, 30½ New Street, has filed notice of organization, to deal in paper products. George Honigblum, 595 Stuyvesant Avenue, Irvington, N. J., heads the company.

Chicago, Ill.—The National Paper Co., 935 North Western Avenue, has been incorporated with a capital of $20,000, to manufacture and deal in paper products. The incorporators are John D. Hardlicka and Joseph T. Moudry.

Everett, Mass.—The Packard Paper Box Co., has been incorporated with a capital of $15,000, to manufacture paper boxes and containers. Isaac Friedland is president; and Joseph Canter, 51 Felton Street, Waltham, Mass., treasurer.

Danville, Ill.—The Halls Wall Paper Co., 4 West Main Street, has been incorporated with a nominal capital of $4,300, to deal in paper products. The incorporators are Ernest R. Halls and C. J. Cook.

Long Beach, Cal.—The Western Paper & Envelope Co., has been incorporated with a capital of $220,000, to manufacture paper products. The incorporators are Bert P. Boles, J. Q. Garwood and Frank H. Jacques. The company is represented by the last noted, with offices at 516-17 First National Bank Building, Long Beach.

St. Louis, Mo.—The Burford-Bohlinger Paper Co., has been incorporated with a capital of $25,000, to manufacture paper products. The incorporators are Alfred P. Bohlinger, Jr., St. Louis; and Wesley C. Burford, Webster Grove, Mo.

Boston, Mass.—The Commonwealth Wall Paper Co., has been incorporated with a capital of 100 shares of stock, no par value, to manufacture and deal in wall paper and kindred products. Charles D. Golub is president; and Samuel Blackman, 36 Cunningham Street, Roxbury, Mass., treasurer.

Matawan, N. J.—The New Jersey Waste Products Co., has been incorporated with a capital of $10,000, to deal in paper products. The principal incorporators are Michele and Umberto E. Sardella, 21 Main Street, Matawan.

Financial

New York, N. Y.—The H. Fishman Paper Co., Inc., 2631 Third Avenue, has been placed in receivership, with Percy Michelbacher appointed in this capacity. The company deals in paper products, and is stated to have assets of about $40,000, and liabilities totaling approximately $20,000.

New York, N. Y.—The American Woodpulp Corporation, 347 Madison Avenue, has filed schedules in bankruptcy showing liabilities of $221,774, and assets of $321,587.

Buffalo, N. Y.—The American Tissue Mills, Inc., has secured a verdict for $13,693.92, with interest from Feb. 18, 1921, against the George Irish Paper Co., 25 River Street, Buffalo. The American company, with plant at Holyoke, Mass., brought suit against the Irish Paper Co., for breach of contract, holding that such company had refused a shipment of paper which it ordered. The defendant claimed that the stock was not in accord with specifications.

Augusta, Me.—Judge F. J. C. Little, referee in bankruptcy for the Cushnoc Paper Co., has authorized an issue of trustee bonds in an amount of $150,000, the proceeds to be used primarily for the purchase of pulpwood for use at the plant.

Augusta, Me.—A group of Maine pulp and paper companies, including the Oxford Paper Co., S. D. Warren Co., Eastern Mfg. Co., Orono Pulp & Paper Co., Maine Coated Paper Co., Nekonegan Paper Corporation, and others, have joined in a protest made to the State Public Utilities Commission, against the Maine Central Railroad Co., for its increase in rates for hauling pulp wood, a new schedule having gone into effect on Feb. 5. It is held that the advance is not justified.

La Tuque, Que.—The Brown Corporation, operating a local sulphate pulp mill, affiliated with the Brown Co., Berlin, N. H., manufacturer of kraft wrapping paper, etc., is disposing of a bond issue of $2,000,000, a portion of the proceeds to be used for general operations and expansion.

Baltimore, Md.—The Chesapeake Waste Paper Co., has arranged for an increase in capital from $25,000 to $50,000, for expansion.

Detroit, Mich.—The McRob Envelope & Paper Specialties Co., has filed notice of dissolution under state laws.

Alexandria, Ind.—The Alexandria Paper Co., has filed suit in the supreme court at Montreal, Que., against the Chicoutimi Pulp Co., of that city, asking damages of $160,344, for alleged breach of contract.

Trade Opportunities

The Bureau of Foreign and Domestic Commerce, Washington, D. C., has information regarding a company at Sydney, Australia, in the market for a printing machine to handle reels of paper, Reference No. 9213. Also, of a concern at Ahmedabad, India, in the market for a quantity of paper.

The Chicago Association of Commerce, Domestic and Foreign Commerce Department, 10 South La Salle Street, Chicago, Ill., has received an inquiry from a company at Osaka, Japan, in the market for a quantity of parchment paper, No. 2748. Also, from a company at Pittsburgh, Pa., desiring a quantity of paper boxes of special design, No. 2757. And from a store at Ishpeming, Mich., in the market for flat paper bags, 11 in. x 11 in. in size.

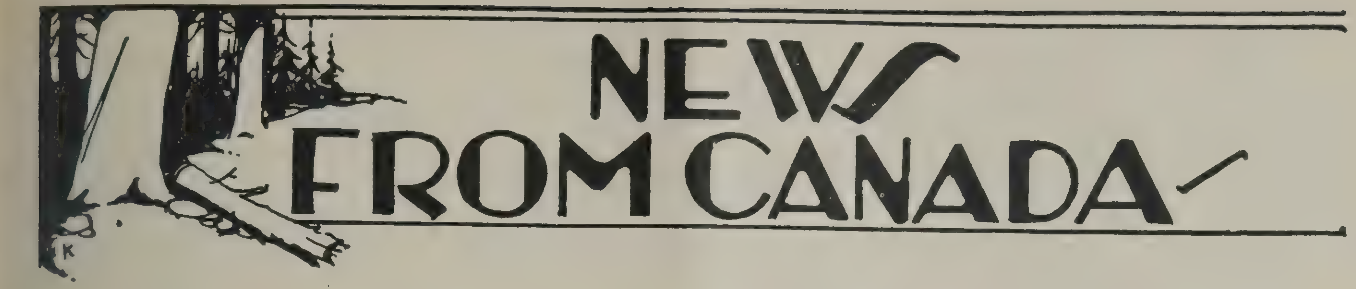
The Bureau of Foreign and Domestic Commerce, Washington, D. C., has information regarding a company at Shanghai, China, in the market for a quantity of paper, including newsprint, kraft, writing, transparent, check, legal and bond, Reference No. 9159. Also, of a concern at Puerto Cortes, Honduras, desiring to purchase fiber building board, Reference No. 9171. Full information on application.

The Domestic and Foreign Commerce Department, Chicago Association of Commerce, 10 South La Salle Street, Chicago, Ill., has received an inquiry from a company at Osaka, Japan, desiring to purchase a quantity of parchment paper, No. 2739.

* * *

Pejepscot Paper Co. Close to Capacity

The Pejepscot Paper Co., Brunswick, Me., has been advancing operations at its three mills and production is now close to capacity, only one of the paper machines being idle. Operations have been resumed at the Lisbon Falls plant, following a shut down of about six weeks, and also at the Bowdoin mill, at which operations were similarly curtailed. It is expected that the plants will be maintained on the present schedule for some time to come.



MORE DEVELOPMENTS IN BECKER CASE

Action Over Bill of Exchange Is Latest Movement Noted

NEW developments continue to take place in the case of Becker & Co., Ltd., of England and Canada.

In the King's Bench Division, in London recently, Mr. Justice Roche heard an action brought by the Clydesdale Bank, Ltd., of St. Vincent street, Glasgow, against Becker and Co., Ltd., of Ludgate-hill, London, claiming £19,507 on a bill of exchange.

Mr. Theobald Mathew, for the plaintiffs, said the claim was by the bank endorsees for collection of the bill and as holders for value. The drawers of the bill were the Chicoutimi Pulp Co., of Canada. It was drawn on July 14th, 1923. The acceptors were the defendants, who accepted on July 30th. Upon presentation the bill was dishonored. The bill represented the price of woodpulp which was shipped by the Chicoutimi company to Becker's and which was delivered to persons who were not holders of the bills of lading. The Clyesdale Bank were the holders of the bill of exchange and the bills of lading. At the request of the Hochelaga Bank, of Canada, the Clydesdale Bank discounted the bill and paid for it £19,000 odd; and they therefore sued as endorsees for collection and holders for value. Counsel did not think there was any defence to the claim on the bill, but he understood that defendants suggested they had a set off or counterclaim.

Mr. Neilson, K. C., for the defence, said there was no question on the bill, but the Clydesdale Bank had received £9,500 on account of the bill.

Mr. Mathew agreed.

Mr. Neilson said subject to that he offered no defense to the claim. There was, however, a counterclaim. This arose out of a bill for £45,000 odd which was about a year earlier in date and in which the plaintiffs and defendants were concerned. This bill formed part of a financial transaction with which Messrs. Becker were concerned with other interests including two Canadian banks, one being the Hochelaga Bank and the other Molson's Bank. The object of the financial transaction was to provide more capital for the Chicoutimi Pulp Co., in which Messrs. Becker were interested and which they founded. Defendants' case was that the Clydesdale Bank improperly protected this bill and they were claiming damages from the Bank for alleged breach of duty. It was the first bill Messrs. Becker had ever had dishonored and was the initiation of all the firm's subsequent troubles. Counsel added that he could not proceed with the action without evidence from Canada that he had not yet got, and he further desired to consider whether the Hochelaga Bank should not be joined as necessary parties to the action.

Mr. Mathew contended that there was nothing in the counterclaim. The bill for £45,000 was, he said, presented when it became due. Messrs. Becker were told it would be protected if it was not paid. Messrs. Becker paid that bill and there was an end of the matter. Nothing was done and nothing was heard about it till Sir Frederick Becker swore his affidavit in the present proceedings. Having regard to the amount of the claims, however, counsel did not think he ought to agree to its being tried on the correspondence alone.

His lordship accordingly gave judgment for plaintiffs on their claim for an amount to be agreed, and adjourned the hearing of the counterclaim.

Present Bankruptcy Petition

In accordance with forecasts of a reorganization of the Chicoutimi Pulp and Paper Company, and apparently, it is said, as a preliminary to such a move, a petition in bankruptcy was presented in Montreal last week against that company by Canadian Fairbanks-Morse Company, Limited, who claims $3,400 against the organization. The petition was set as returnable in a fortnight and iterim receivers were appointed. These receivers, who took immediate control of the operations of the company are: Eugene Trudel, liquidator, Quebec; D. B. Brodie, Quebec, and Arthur Ross, Montreal. In financial circles this move is taken to mean that developments will shortly arise tending towards reorganization after liquidation, or sale to the Price interests, as reported.

* * *

To Erect Pulp Mill

G. E. Farlinger, of Sioux Lookout, Ont., who was in Kenora a few days ago, made the announcement that it is the intention of the Farlinger Compay, Limited, to erect a pulp mill at Sioux Lookout at a early date and that eventually they will add a paper mill to turn out the finished product in the shape of newsprint. Engineers will be engaged at once to survey and plan the work for the development of water powers on the English River. The company is capitalized at $2,500,000 and will contract to furnish light and power to the town. The Farlinger Lumber Company is taking out about 300,000 ties this winter, besides a heavy cut of logs for lumber, and will run their mills to capacity during the summer.

* * *

No Action Taken

No action was taken by delegates to the Associated Boards of Trade gathered in session at Cobalt this week, with regard to a resolution from the Cobalt board favoring an embargo on pulpwood, and the subject was dropped after a short debate, in which the balance of opinion was against any such measure. The Boards favored some steps being taken towards compensating the settlers to whom money was owing by the Mattagami Pulp and Paper Company, which has been in the hands of a receiver since 1921.

HANSON WANTS EVIDENCE ON EMBARGO

Detailed Report of the Events In The Canadian Embargo Matter

R. HANSON, a member of the Canadian House of Commons from one of the eastern Canada districts that is recognized as in the pulpwood territory, has filed a request for all correspondence on the embargo between the Canadian government and the American Paper and Pulp Association and individual pulp and paper manufacturers of the United States. Hanson is said to be desirous of having the embargo imposed against shipments to the United States, despite the fact that, when the pulpwood commission held a sitting in Fredericten, his home town, the bulk of the witnesses testified against the embargo. At the present time, Hanson is involved in a libel case against the *Fredericten Daily Gleaner*, which accuses him of using improper legal practices. Hanson is a member of the Conservative party, which the newspaper also represents. Hanson's party chief, Arthur Meighen, has lately emerged in favor of the embargo, and has made several speeches in different parts of Canada in favor of the ban on pulpwood exportation to the United States.

The opponents of the embargo seem to have lost some ground in recent weeks. It has been mentioned in some quarters that Canadian farmers would all look with favor on the embargo providing a minimum price per cord were agreed on and enforced by the government. That an agreement to this effect would be reached is an opinion advanced by one pulpwood operator who has been shipping large quantities of pulpwood to the United States each year. The contention has been advanced that the people who sell pulpwood should prefer to sell the wood to Canadian mills and thus aid in furthering Canadian industry.

The passing of the order-in-council by the Canadian government under which contracts made this year or previously for the supplying of pulpwood for exportation to the U. S. were immune if the embargo were imposed, has been used in favor of the embargo, and it is possible that the government will reconsider its stand. It must be admitted that when the question was originally discussed in the Canadian parliament, the preponderance of sentiment was in favor of the embargo, as a means of conserving pulpwood and forcing the establishment of pulp and paper mills in Canada.

Maxwell In Charge

Hon. James Lyons, Minister of Lands and Forests for Ontario, has announced that Capt. W. R. Maxwell has been engaged to take charge of the forest fire protection flying squadron in Northern Ontario. He will establish depots in the north for the thirteen aeroplanes recently purchased by the Government and will have complete charge of the service at a salary of $4,500 a year. A sum of $55,000 has already been spent on the new service.

One-half the world doesn't know how the other half lives. This is a great disappointment to one-half the world.

Rossing Plant Busy

The rossing plant which was established some time ago by the Heyland & Thompson Lumber Company at Landrienne, Ont., about 157 miles east of Cochrane, is busy at the present time and is rossing about fifty cords of pulpwood daily. The company have made arrangements for rossing pulpwood at several other points along the Canadian National Railway, and particularly in the La Sarre district in Quebec, where they are having 100 cords rossed each day. The company have bought up a considerable quantity of unpeeled spruce and balsam which is being delivered alongside track, the prevailing prices being $5 to $6 per cord, according to freight haul. They have also undertaken to supply the Abitibi Power and Paper Company with 20,000 cords of pulpwood, and between Jan. 1 and March 1 shipped about 24,000 cords, one-third of which went to the Abitibi Company at Iroquois Falls, and the remainder to mills in Southern Ontario and Pennsylvania. The demand for rough unpeeled pulpwood at the present time is fair, but owing to the deep snow and lack of frost, many settlers had great difficulty in getting their product out to the railway tracks.

* * *

Discuss Reorganization

At the adjourned annual meeting in Montreal of the Saguenay Pulp and Paper Company the difficulties of the organization were again outlined by the President, Senator Beique, and reorganization plans discussed. According to the president, there is no question of liquidation, and in regard to an offer from Price Brothers interests he made it clear that there has, as yet, been no offer direct from such interests, and until such time he felt such offers could hardly be considered. C. G. Heward, K. C., was elected to the board of directors, taking the place of Hall Caine, who had been the nominee of Sir Frederick Becker on the board. The financial statement showed a deficit of $183,826 for 1923, as compared with a deficit of $419,579 in the previous year. Earnings at $1,502,522 compared with $1,477,390 in the previous year.

* * *

Typothetae Men Entertained

Delegates to the meeting of United Typothetae District No. 16 at Hamilton, Ont., last week were entertained at a banquet tendered them by the well-known paper house of Buntin-Gillies, Limited, when the chief speaker was A. L. Lewis, of Toronto, who spoke on "The Printer and His Problems." The question of the printer charging a sales tax on his output, which has been the subject of interviews with the Government, was up for discussion at the Typothetae meeting.

* * *

Conference Held

A conference was held in Toronto last week between the text book committee of the Canadian Pulp and Paper Association and a representative of the Westinghouse Electric Company, Limited, for the purpose of checking up on the description of the Westinghouse Electric Drive which is to appear in the fifth volume of the text books of the pulp and paper industry.

* * *

Saskatchewan Is Busy

J. H. Anderson, a veteran western lumberman, told the Canadian Pulpwood Commission during its sitting at Prince Albert in Saskatchewan that that province was in the eve of a big development in the pulp industry. Charles McFadyen, forestry inspector, gave evidence as to the timber resources of that province, saying that 113,000 out of a total of 256,000 square miles in the province were timber lands and he estimated that there were 25,000 square miles of merchantable timber.

ST. REGIS COMPANY TO BUILD NEW MILL

Work Will Be Started In Early Spring On $5,000, 000 Mill

According to announced plans the St. Regis Pulp and Paper Co. will build a $5,000,000 mill at Cape Rouge, Que., work on which will be started early in the spring. The company has taken options on a number of pieces of property. It is said that the new mill will be the most important operated by the company, and that though at first the expenditure will be under $5,000,000, the ultimate expenditure will be $8,000,000. The company has 37,000 acres of freehold land on the Godbout River on the north shore of the St. Lawrence, and 14,000 acres along the Transcontinental Railway, near Escolena, Abitibi.

Commenting on the reports of new pulp and paper enterprises in Canada, the Montreal Gazette says: "There is some talk here and there of the establishment of new pulp and paper companies in this country. If any such projects get beyond the stage of discussion this year it will be interesting to note their reception by investors. While it may well be that the fears one occasionally hears expressed as to the possibility of over-production are without foundation, the fact remains that the old established companies have programmes of expansion in operation and in prospect, which may be counted on to take care of the increase in consumption and the decrease in United States production for some years to come. Therefore it would seem that investors in the Canadian pulp and paper industry of Canada, and the country in general have more to lose than to gain through a too rapid growth. A counter argument to the theory that there might be over-production of newsprint is that in the throes of a presidential election the United States will use much more newsprint this year than normally and thus bridge the gap.'

Has 25th Birthday

The Ratcliff Paper Company, York Street, Toronto, jobbers in coarse papers and other paper lines and one of the best known paper distributing houses in Ontario, has just celebrated its twenty-fifth anniversary. The firm was founded a quarter of a century ago by Fred L. Ratcliff and S. J. Douglas, both well-known paper men. Mr. Douglas withdrew from the firm some years ago and Mr. Ratcliff, who is now abroad, has remained as president of the company since the dissolution of the partnership. T. E. Gain is the vice-president and Norman J. Ratcliff is secretary. Another interesting feature in connection with the firm is the celebration of the fiftieth anniversary of his wedding by Thomas Barker, sales manager of the company, who has been in its employ since its foundation. Mr. Barker, who is one of the most popular of Ontario paper men, was the recipient of gifts from the company and fellow employees in celebration of the event.

Herbert L. Thomas Dies

The death took place at Clifton Springs, N. Y., a few days ago, of Herbert L. Thomas, of the purchasing department of J. R. Booth, Limited, Ottawa and Hull, who was well-known in the paper industry in Canada. Deceased, who was born in Bristol, England, came to Canada about twenty-seven years ago, after graduating in arts at the London University. During all that time he had been in the employ of John R. Booth. He was being treated at Clifton Springs, N. Y., for nervous breakdown.

Pioneers In Research

The Canadian Pacific Railway was
Pioneer in initiating research for the utili
tion of western flax straw. Its efforts
this direction date back to 1916. About
date the company engaged at considerable
pense the services of the Arthur D. Li
Co., whose report and research work on
possibilities of manufacturing pulp and st
from western flax straw still remains the
complete investigation of this problem
has yet been made. The result of this w
clearly showed that a high grade pulp c
be made from this material from which
high grade paper was made, and actu
utilized for some time in the executive off
of the company. This corporation has
only co-operated with the National Resea
Council in this matter, but actually coll
the materials used in tests carried on by
Bureau of Standards at Washington. The
forts thus made now seem likely to bear f
in the near future. One important paper c
pany has plans well advanced for the use
western straw in papermaking.

FORESTRY in the PAPER INDUSTRY

Conducted by J. R. Simmons, Secretary Forester, the New York State Forestry Association

THE WEEK'S NEWS ABOUT FORESTRY REPORTED FROM SIX STATES

Paper Men Active Forestry Leaders Throughout the United States in Conserving the Timberlands

AN important forestry referendum will be submitted to the people of Wisconsin, where the paper manufacturers have sponsored the formation of the Wisconsin Forest Protective Association, the balloting being held the coming fall. The constitutional amendment which will be voted upon follows:

"The state may appropriate moneys for the purpose of acquiring, preserving and developing the forests of the state; but there shall not be appropriated under the authority of this section in any one year an amount to exceed two-tenths of one mill of the taxable property of the state as determined by the last preceding state assessment."

A previous decision of the state supreme court had ruled state forestry activities as works of internal improvement, a ruling which the proposed amendment would rectify. The amendment has been ratified by the legislatures of 1922 and 1923, and having been ratified by two successive legislatures is now ready for submission to the electorate.

The Forest Protective Association, of which D. C. Everest of the Marathon Paper Mills Company is president, is now arranging for a joint session with the lumbermen of the region, looking toward the establishment of a better system of state fire prevention.

The outstanding fact in connection with this movement for truly progressive forestry legislation is that the manufacturers are assuming the leadership.

Minnesota Makes a Change

W. T. Cox, for twelve years state forester of Minnesota, has been dismissed by the State Board of Forestry, without the announcement of any charges against him. A sharp editorial in American Forestry declares the action is purely politics, and deplores the change. The Minnesota forestry situation is of intense interest to the paper industry, because of the extensive development of paper mills in the Lake states.

A New Forester in Alabama

A new state forester has begun work in Alabama, under the law establishing this new department, as of Feb. 15, 1924, the incumbent being Maj. Page S. Bunker, whose first duty will be the handling of the problems arising from the relief of taxation of forest lands assigned to the state until the timber is cut by the forest owners.

Insurance Increases in Connecticut

Connecticut has the tallest fire lookout in New England, but instead of being in the woods, it is in the heart of the state's capital. The Traveler's Insurance Company has made available to the state its tower, the highest structure in New England, and so located that from its 527 feet of height a fire on any portion of a quarter of a million acres of woodland can be spotted.

Pennsylvania Sets New Record

Pennsylvania tree planting during 1923 was the largest in the state's history, passing the 5,000,000 mark. Upon maturity the trees so planted will produce two hundred million board feet of timber.

Association Conference in Texas

Extension of the forestry movement in Texas, particularly in the regions where the paper industry is getting a foothold, was discussed recently by the Texas Forestry Association when aggressive action toward reforestation was urged. Speakers pointed out that the state itself should take the lead in the movement, and not depend too largely upon Washington, and the federal service.

OVER-CUTTING IN GERMAN FORESTS APPARENT

Verification Given to Article in Another Part of Paper

GERMANY'S financial situation is resulting in over-cutting of the German forests, hitherto held relentlessly in reserve for future utilization, according to Dr. P. C. A. Schenck, now in Germany, but a former head of the Biltmore forest school in North Carolina. According to Dr. Schenck, excessive taxation is foregoing an era of cutting, beyond the capacity of absorption of the domestic market. As a result, exports of lumber and other forest products are growing, and throwing on the American market large quantities of pulp and paper that would otherwise be consumed in Germany. In a letter to friends in America, Dr. Schenck says:

"There is a great multiplicity of taxes, such as the ground tax based on the productive capacity of the soil. Every owner is forced to contribute to the forest organization of the country, to the forest protective staff of the state or town government, to old-age insurance; collect taxes from the pay-rolls of his employes, pay a subsidy to the public press amounting to one half of the values obtained from timber sales, and pay in addition a sales tax on his entire turnover."

Dr. Schenck then says that these are merely a preamble for the real taxes, for the state and general government. The total of the taxes paid monthly or bi-monthly, is 1.5 per cent of the value of the forests, which do not yield more than 2 per cent.

The result of these taxes is a cutting of the timber beyond the reproductive capacity of the holdings, the timber and pulpwood market is overstocked, with the resultant prophecy that an increasing amount of pulp and paper will be thrown on the American market.

* * *

The Oil Scandal Mentioned

The oil scandal at Washington is being mentioned by the New York State Forestry Association as an example of the need for continued activity of all those interested in the nation's resources. Had those involved in the oil cases had their way, the National Forests would have been transferred from their present control by the Department of Agriculture to the department which authorized the leasing of the naval oil reserves.

R. S. Kellogg

President,
Newsprint Service Bureau,
342 Madison Ave., New York

Says:

MY DEAR KEENAN:

There have been two really discriminating reviews of "Pulpwood and Wood Pulp in North America," that is, reviews that indicate the authors of them really read the book and grasped its purpose; one of these was by Prof. Lee of the New York University School of Journalism and the other by yourself, which I greatly enjoyed reading this morning. More than any other reviewer you have realized that the fundamental purpose of the whole thing was to drive home the necessity for forest production and to promote a consideration on the basis of facts, of the measures which are essential thereto.

I am asking Mr. Hughes to send me a few extra copies of the magazine, which contains your review.

R. S. KELLOGG.

Enter the Pine Sawfly

Just as we were congratulating ourselves upon the adaptation of Jack Pine to the paper industry, on an economic basis, comes news of the destructive Jack Pine Sawfly activity in the Lake States region. The sawfly goes under the rather impressive scientific name of Diprion abiatis, and the fact that the second half of his name is not capitalized is no indication that he can't do the business when it comes to forest depredation.

Raphael Zon, head of the Lake State Forest Experiment Station, says that in some stands as high as a third of the trees have been killed, although he adds the more encouraging statement that the damage in the average stand is not so severe. Dr. Graham, forest entomologist at the University of Minnesota, has found an average of 38 unopened cocoons to a square foot of litter, or 1,500,000 an acre. Every evidence points to a general outbreak of the sawfly which makes imperative the development of control measures. A general study is planned for the present year by the Bureau of Entomology, the University of Minnesota, and the Lake States Forest Experiment Station.

Scientists have occasionally predicted that the end of the world would come when destructive insects and plant diseases gained the supremacy. There is scarcely an agricultural crop known to man that does not have its enemies, in the form of insects, diseases or fungus growths. Again we must admit the importance of research and experiment to offset the ever increasing hoard.

* * *

Problem for Industries

Raphael Zon, Director of the Lake States Forest Experiment Station, maintained by the Forest Service, United States Department of Agriculture, declared in a recent interview in Washington that one of the major forestry problems in the Lake States is the artificial reforestation of about 20,000,000 acres of waste land that once supported forests. Director Zon says this is an urgent necessity and, in his opinion, a joint problem for the public and the interested industries.

"The basic problem in forest rehabilitation in the Lake States," stated Dr. Zon, "is protection of forests from fire. Without such protection forest reproduction is impossible. But adequate protection can not be assured without keeping the forests green by cutting only a part of the mature timber and leaving a part to form the nucleus of the new forests."

Director Zon also stated that experiments will probably be undertaken on a small scale by the Forest Service to determine if it is possible to increase the rate of growth of black spruce on about 12,000,000 acres of swamp land in the Lake States by partial drainage, in which a part of the water will be removed from that area.

Lumbermen Adopt Resolution

The appearance of O. M. Porter, secretary of the Woodlands Section of the American Paper and Pulp Association before the Northeastern Retail Lumbermen's Association for a talk on the retail lumberman's share in the forestry program of the nation was followed by the adoption of the following resolution:

"Whereas, the promotion of reforestation is vital to the retail lumber industry of the future we would conserve the source of supply of the material we have.

"Therefore be it resolved that we recommend to the Board of Directors the initiation of a program of co-operative action on the part of our members for the promotion of reforestation in the several states of our association territory."

Paper Which Spoke

During the great war, when newsprint was made in England with a furnish two-thirds waste paper, most mills found it difficult to keep hard stock consistently cleared. Until they got used to it the printers complained bitterly about occasional letters of the alphabet appearing on the unprinted sheet.

One mill got the usual complaint on this subject and the customer got the usual reply—that there was a war on, and in any case they didn't charge extra for the print.

The printer wrote again stating that, "under the circumstances no serious objection was taken to occasional letters but a line had to be drawn at whole words—see enclosed sample which speaks for itself."

The enclosed sample was had and showed several complete words. The printer had ringed one of the words with blue pencil—it spelt "damn."

Wisconsin Forest Men Meet

The next meeting of the Wisconsin Forest Protective Association, by order of the President Mr. D. C. Everest, will be held at the Congress Hotel, Chicago, Illinois, in the Francis First Room on Wednesday, March 12th at 3 P. M.

Matters of great importance to the Pulp Industry will be considered. A full attendance is expected and plans will be laid for a program for this Association to follow.

Mr. Ernest E. Hubert, President of the Madison, Wisconsin section of the Association of American Foresters, is expected to be present, also Mr. Raphael Zon of the Government Forestry Station, who will give a survey of what his department is doing in the line of forest protective work.

* * *

New Inventions in Industry

It is often said that there is nothing new in the Industry today; but we believe that there is nothing perfect in the Industry today and a casual investigation of the *Patent Office Gazette* will disclose that there is something new in almost every Industry offered almost every day.

One of the latest things offered in Wisconsin is the new beater roll invented by Casper E. Youngchild, Superintendent of the Nekoosa Mills of the Nekoosa-Edwards Paper Company, which increases the capacity of beaters about 25 to 35 per cent by hydrating the fibers that much faster than by the old method, thus saving equipment, time, labor and power, as well as producing a better grade of paper for wrapping purposes, as the sheet is given better folding and tearing qualities without reducing the pop or tensil strength test as shown by the Mullen tester.

Coolidge Receives Delegation

Support of President Coolidge for the McNary-Clarke reforestation bills, now pendin in Congress, was expressed at a conferenc with a delegation which included R. S. Kellogg, chairman of the Forestry Program Committee, formed largely through the initiative of America's paper industry. Othe members of this committee, as well as lumbermen and others prominent in the movemen for a forestry policy, were in the delegation which Mr. Coolidge received.

At this conference the President expressed himself as favoring the purposes of the bills as embodying the minimum present requirements of a general forestry policy.

The paper industry's part in the genera movement has been of highest importance, and the National Chamber of Commerce was represented at the hearing by its resident vice-president, as spokesman for the organization which conducted a nation-wide referendum on the proposals of its forestry committee, of which Dr. Hugh P. Baker, secretary of the American Paper and Pulp Association was vice-chairman.

* * *

A New Move in Forestry

A new move in industrial forestry has been made by a co-operative arrangement between the Manufacturers Association of Connecticut and the state forester, for the utilization of the Connecticut timber susceptible of use for small dimension stock. The manufacturers organization offers to take the manufacturers' specifications submitted to them and by handling through the state forester get a better market for Connecticut wood now being wastefully used. For instance, Connecticut manufacturers are importing hickory plank from Memphis, when fine second growth hickory of the grade desired is being chopped into cordwood by farmers who have not enough in quantity to warrant their seeking a market for the wood as lumber The method being followed is exactly the same as that being used in some portions of New York state by county organizations for the collection of pulpwood from small cutters for consolidated marketing to the paper and pulp mills.

* * *

Metal Counter Roll Plugs

Showing that the tendency even in the paper industry is to get away from wood in every way that it is possible to do so, is the invention of some of its employees taken over by the Nekoosa Edwards Paper Company of Port Edwards, Wisconsin.

Gilbert Marvin and Joseph Wipfli, seeing the tendency of events, have invented a metal counter roll plug to take the place of the heavy wooden plugs now used in all counter rolls of wrapping paper produced. That our readers may have an idea of the number and weights of wooden plugs used in the wrapping paper industry, let it be known that of the 6000 tons of wrapping paper per day made in the United States, 90 per cent is in counter rolls and there are an average of about 70 rolls to the ton, 5400 tons per day and 70 rolls average to the ton makes an average of 378,000 rolls per day and two plugs per roll or 756,000 plugs per day, weighing about 2¾ ounces per plug or nearly 200,000 pounds, or 100 tons of plugs per day.

The new metal plugs do not weigh more than 25 per cent of the old wooden ones and it is expected that pressed metal manufacturers will produce them at a price below the cost of the wooden ones, making a saving not alone to the paper mill; but to the customer and final consumer as well.

Wisconsin again leads in something new for the paper industry.

NEW DEVELOPMENTS IN PAPERMAKING

Stripping Paper

A new method of removing or stripping sheet material from a surface, as for example the drying drum or the felt of a paper making machine has been patented in England according to the World's Paper Trade Review.

The device which is seen in the accompanying illustration comprises the following essential parts. The hollow doctor 1 has a passage 6 in the toe 2, down which a fluid such as air, which may be heated, from a hollow portion 4, passes to strip the web 10 from the cylinder b, the fluid forming a cushion at 11 between the doctor and the cylinder. Additional jets 15, 16 and 17 may be provided to direct the web away from the doctor 1. The doctor may extend across the drying drum, or two doctors 1, as seen in figure 3, may be used, in which case a ribbon of the web is threaded through the drier in the first place. The doctors 1 may be used in vacuum drying apparatus, as in figure 2, wherein the vacuum is maintained by suction at 20, and steam is employed as a fluid for the doctors.

FIG.2.

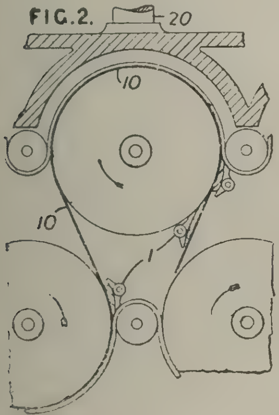

FIG.1.

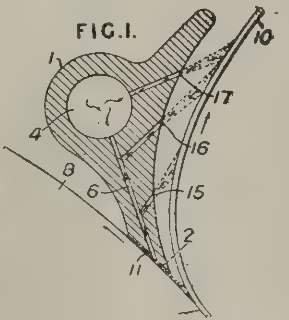

FIG.3.

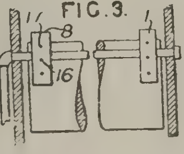

* * *

Paper For Music Rolls

Perforated paper of a durable nature, capable of withstanding atmospheric changes and therefore suitable for music rolls, cards for sorting and classifying machines, etc., is made by treating paper, preferably before perforation by a process which is patented in British Patent No. 201,463. In case the paper is intended to make rolls which will be employed in tropical climate, it may be advantageously coated with a thin film of a molten wax or a wax emulsion. British Patent No. 203,567.

* * *

Binder From Sulphite Waste Liquor

United States Patent No. 1,467,321 is concerned with a process for the use of the waste liquors recovered from sulphite cellulose mills as a binder for foundry cores. Ammoniated sulphite-cellulose waste liquor is neutralized and concentrated. Any lime present is precipitated by treatment with just sufficient sulphuric acid or ammonium sulphate and the liquor filtered. Any excess of acid is removed by adding ammonia, and the magnesium present is precipitated with ammonium phosphate. The liquor is then mixed with sixty times its weight of sand and baked at 450 degrees C, a small proportion of petroleum oil being added before baking. The product is very suitable for use for cores in foundry casting, possessing considerable tensile strength and not being affected by the presence of water. Hitherto it has been impossible to obtain a binder rendered insoluble by a degree of heat which did not carbonize the organic materials present.

Making Marbled Paper

A new process of producing a marbled paper or a paper whose surface is covered with designs is described in German Patent No. 388,095. The designs are produced by using a machine wire which is made in relief to give a corresponding design on the surface of the paper. The paper web is then subjected to a pressure on a second flat wire.

The wire which produces the design on the surface of the paper is made in about the same manner as the waterproofing wire which gives a distinct waterproof in bond papers. The wire which is fastened to the same in the form of the design must be as strong as possible but at the same time it must not interfere with the taking up of the pulp by the wire. The wire itself may be pressed out in relief so that a design made of separate wire need not be employed. In this case the design is pressed into the wire.

The paper stock is fed on to the designed cylinder wire and the stock on the wire is sprayed with a little water. The stock which lies on the higher portions of the wire are then shoved aside by means of a suitable device and the stock in the depression on the wire remains unchanged. Then the wet web which has the form of the design is brought to another part of the machine and combined with another flat paper web. This gives a marbled or designed paper consisting of two parts, the flat under-layer of paper and the design fixed to the same.

* * *

Compact Thick Paper

In the manufacture of compact, thick paper by the process which is patented in German Patent No. 381,144, the paper is sized with liquid rosin which is obtained from fir or pine wood and then the paper is dried at a temperature of 100 to 120 degrees C. The rosin size is applied in the form of a solution or emulsion in organic solvents or solutions of soap. Freshly prepared rosin yields a superior paper, it is claimed.

* * *

Vulcanized Fiber

Vulcanized fiber is prepared from paper which has been made from cotton linters in the usal manner. It is essential that the cotton linters should not have suffered any or little chemical deterioration. The fiber that is made in this manner is stronger and possesses a greater resistance to bending than the regular type of vulcanized fiber. The process is patented in German Patent No. 376,384.

* * *

Paper Pulp Production

The water-soluble constituents of the ashes, which are obtained from the combustion of fuels, particularly peat, brown coal and other kinds of coal, when burnt alone or in admixture with dried filter-sludge ,can be utilized, with or without the addition of certain acids or alkalies, for the digestion, under atmospheric pressure or increased pressure, of cellulosic materials, such as straw, esparto, bamboo, flax, hemp and wood. The finely powdered ashes may be added direct to the digester, or an aqueous extract of the same may first be made. The quantity of ash required is generally the same as that of the caustic lime that is commonly used for the same purpose.

The addition of certain acids to the ashes results in the production of light yellow to deep brown pulps. By adding certain alkalies pulps are obtained which are capable of giving a bulky and highly absorbent paper. "Ash" lye is particularly suitable for removing lignin from mechanically disintegrated materials. Lignin residues from pulps which have already been chemically treated. Wood pulp prepared by this process has a high content of long fibred cellulose, and is suitable for the manufacture of strong printing papers. The exhausted digestion liquor may be used for the production of a highly nutritious cattle food or as a source of alcohol.

For further details regarding this process see British Patent No. 203,601.

News From New York State

SMALL HOPE FOR CREDITORS OF CARTHAGE SULPHITE

Appraisal Filed Has Little Upon Which to Base Hopes for Return

WATERTOWN, N. Y—No hope for creditors of the Carthage Sulphite Pulp and Paper Company, of Carthage, realizing upon their claims is held out in the appraisal of the property, filed Wednesday in United States Court at Utica. Instead it is conjectured by those advised on the subject, that the entire plant may be turned over to the bond holders, who alone, with a small coterie of creditors, are secured in their investments.

Appraisers estimate the value of all assets of the company at $605,342. Against this, having preference over the bills of the many creditors, stands the mortgage of the bond holders, totaling some $560,000. There are also to be settled with before the majority have a chance, five secured creditors with claims of $34,103.81. Lastly come the unsecured liabilities, 237 of them, with bills aggregating $405,992.75, and whose chances of realizing even a small percentage is believed by many familiar with the finances of the situation to be nearly nil.

James F. Akin, of Ogdensburg, Charles Burroughs, of Potsdam, and Frank L. Moore of this city made the appraisal. Largest of the single assets which they accord the bankrupt company is its water power in Carthage, valued by this trio of experts at $211,869.

They find 736 horse power of the first class, which they value at $40 per horse. There are 203 horse power of the second, or non-constant class, worth $15 each, and both are rated at a 75 per cent factor. The reproduction cost of $58,601 is reduced and the power capitalized at 10 per cent by the appraisers, giving it a value of $211,869.

The plant itself, the building and the like, is estimated at $44,591; the ground wood building at $8,356 and its machinery at $28,970; machinery and equipment in the main building, $69,970; flume and power development, $14,400; truck and furniture, $3,536, and miscellaneous equipment, $8,000. The machinery in the sulphite mill, which was damaged by fire last year, is listed at $24,152. Of the other assets found by the appraisers, supplies are rated at $51,023; paper on hand at $2,400; accounts, $21,692; life insurance to be received, $23,445; Black River Regulating District, $500; fire insurance held by the United States Mortgage and Trust Company, $42,012; one sixth interest in the Mt. Louis, Province of Quebec, property, $25,000.

Property in Canada would be covered by creditors in the Dominion and it is said that United States claimants could not hope to benefit from it. The first claim of the bond holders, however, will take practically all of the principal assets, and the priority of the secured creditors will apparently account for most if not all of the balance.

In his petition to Federal Court, Charles E. Norris, of Carthage, as receiver for the company, shows the grand total of indebtedness faced by the concern to be $1,000,500. This includes the bonds, duly secured by mortgages upon the real estate, water power and plants; the preferred creditors and the "floating" debts represented by the $440,000 claim.

Of the assets a portion is uncertain, namely, the fire insurance upon the burned sulphite mill, which has never been adjusted, but against which the Watertown National Bank has filed claim for $10,000 under an assignment. There is also the life insurance on paid up policies due in November, 1924, and $42,012 held by the United States Mortgage and Trust Company as trustee of the bond-mortgage, to insure replacement of the sulphite mill or retirement of bonds which might fall due.

Concluding his report, Mr. Norris advises that it is impracticable to operate the plant and that any attempt to do so would result in further losses to creditors; that it is impossible to borrow sufficient funds to properly finance the company, either for temporary or permanent operations, that carrying charges are a burden and that the best interests of creditors will be conserved by an immediate sale and disposal of the assets of the bankrupt.

Of the many unsecured creditors appearing upon the schedule, which is made a part of the receiver's report, appear the following:

Bagley & Sewall Company, $3,877.43; Carthage Coal Company $12,719.65; Carthage National Bank, $26,298.67; Dexter Sulphite Pulp and Paper Company, $8,653.40; Diana Paper Company of Harrisville, $7,417.65; L. D. DeCant estate, city, $1,454.43; H. F. Farfrington & Co., city, $3,292.47; Great Northern Junk Company, city, $1,578.39; R. F. Hammond Inc., New York, $92,724.95; Haskins & Sells, city, $2,199.69; National Exchange Bank, Carthage, $12,500; Northern New York Utilities, Inc., $47,542.53; Northern New York Coal Company, city, $1,805.96; D. J. Renaud & Son, Carthage, $1,260.83; Ryther & Pringle Company, Carthage, $3,188.88; H. I. Starkweather, Carthage, $1,777.29; W. C. Stebbins estate, city, $1,778.56; West Carthage Iron Works, $1,099.55; West End Paper Company, Carthage, $1,237.23; Frank P. Wilder, Carthage, $1,251.72; Watertown National Bank, $15,000.

The five secured creditors are: Dilts Machine Works, Fulton, $2,327; Ambrose Gormley & Company, Carthage, $513; tax collector, Morristown, $15.57; Village of West Carthage, $17,043.88; Westinghouse Electric Company, $14,203.

Federal Judge Cooper has directed all interested parties to appear before him March 7, at Albany to show cause why the suggestions of the receiver should not be carried out.

BAGLEY & SEWALL MACHINE BREAKS RECORD

Algonquin Company Machine Turns Out 96 Tons in 23 Hours

WATERTOWN, N. Y.—All records in the United States and Canada, and probably in the world, for the production of paper by one machine were broken on Wednesday of last week by the Bagley & Sewall paper machine installed about nine months ago in the plant of the Algonquin Paper Company at Ogdensburg.

In 23 hours the machine, one of the newest of the Bagley & Sewall machines, turned out 96 tons of standard newsprint running at a speed of 760 feet a minute. The machine is one of the largest in the country, being 204 inches wide and turning out a sheet that trims 194 inches.

While other paper machines have operated at a much faster speed—some of them at more than 1,000 feet a minute, the sheets are not so large, and the high speed is not maintained for a long period of time. The Algonquin machine has been averaging about 730 feet a minute and on other days has turned out as high as 93 tons a day. The new record was the best ever made by the machine, however, and according to officials of the Bagley & Sewall Company no paper machine in the United States or Canada has ever turned out 96 tons of paper in a day. It is believed also that there is no machine in Europe which has ever attained that capacity.

Richard Gray, representing the Bagley & Sewall Company, leaves next week for Vancouver, Wash., to set up a machine for the Columbia River Paper Corporation. The machine is a 136 inch machine and will be the first unit in a new paper mill, which eventually will have two or three machines. A sulphite mill has been in operation about three months, and a large sawmill has also been constructed in connection with the mill. It will require about three months to set up the machine.

* * *

BAGLEY & SEWALL TO SELL MACHINE IN CHINA

Watertown Company Receives Word Upon Return of Salesman

WATERTOWN, N. Y.—Edward S. Lansing, of the Bagley & Sewall Company returned last week from New York where he signed for his firm a contract by which the Watertown concern will deliver to a paper manufacturing concern in Hankow, China, a paper mill machine to be made at the Bagley & Sewall plant in this city during the next few months. Delivery is to be made by next June. The machine is the 88-inch design for making straw board In the Chinese republic today there are but ten or twelve papermaking machines in spite of its many millions of people, and the Bagley & Sewall Company made three of these.

The Hankow Company makes the straw board for boxes. Heretofore this product has been made by hand. So cheap is Chinese labor that the work can be done by hand at a profit. The papermaking machine will reduce the costs even more, however. The Bagley & Sewall Company has made a score or more of machines for Japanese concerns, but this is the first machine they have made for a Chinese firm in a dozen years or more.

The order means increased activities at the Bagley & Sewall plant in Watertown.

There is no doubt as to the industrial activities in the Far East at the present time, and American trade, tired of waiting for a revival in Europe and a resumption of sound conditions there, is turning more and more to the Eastern market for its business, just as the Bagley & Sewall Company did in this instance.

The local concern will begin work on the new contract immediately.

* * *

NORWEGIAN PULP AND PAPER IN 1923

Hopes That the Year Would Bring Relief Not Carried Out in Actuality

HOPES of Norwegian paper and pulp manufacturers that the year 1923 would bring an improvement in the industry were not fulfilled. The opinion now prevails that although production was maintained at almost normal during the past year, the prices received did not permit a reasonable margin of profit.

The year commenced well, with good sales and partly rising prices during the spring, but as summer approached a slackening both in paper and pulp began and continued to the end of the year. Only through the doubtful benefits derived from the depreciation, the Norwegian currency during 1923 were the factories able to keep running in the face of falling prices. The paper and pulp export markets during 1923 were adversely influenced by the strong protectionistic trend in tariffs the world over. Nevertheless, the total volume of the pulp and paper exports in 1923 was only a trifle lower than that of 1915, which was a record year for exports. In the case of chemical wood pulp and cardboard, the figures are the highest on record. Pulp and paper exports during the first 11 months of 1923 were valued at 247,000,000 crowns, as compared with 229,000,000 crowns in 1922. (The average value of the crown in 1923 was $0.167 and in 1922 it was $0.175.)

The production and export of chemical wood pulp was very large, but prices, which during the first six months of the year continued to rise, fell steadily after July. This drop, however, was not very definitely felt by Norwegian mills because the crown continued to depreciate during the year, thus absorbing most of the price drop in sterling and dollars. A prolonged strike in the Swedish industry and a subsequent strike in Norway caused a considerable reduction in stocks, so that at the close of 1923 the amount of chemical wood pulp on hand was estimated to total only about 10 per cent of the year's production of bleached and unbleached sulphite.

* * *

Take Group Insurance

More than a thousand employees of the Tate Paper and Color Industries, Inc., an organization with five plants in New York and New Jersey, have joined with their employees in acquiring group life insurance from the Metropolitan Life Insurance Company, according to an announcement today by the latter.

George Tate, the president of the company, carried on the negotiations for the group policy from his general offices, at Glens Falls, N. Y. Two of the factories are at Plattsburgh, N. Y., and three are at Hackensack, N. J. Under the agreement, the company will share with the workers in the payment of the premiums.

The insurance provided will be in the form of straight life certificates for $1,000 for each of the 850 men employees and for $500 for each of the women and girls.

AUSTRIA INCREASES PULP PRODUCTION OF

Paper Production Up to 80 Per Cent of Output Before the War

POSSIBLY the best indication of the growing improvement in the Austrian paper industry is the increase in production for 1923 over the preceding year, says Assistant Trade Commissioner E. M. Zwickel in a report to the Department of Commerce. The manufacture of chemical wood pulp increased by 2 per cent, mechanical ground wood by 14 per cent, cardboard by 5 per cent, and paper by only 1 per cent.

Production of wood pulp exceeds that of pre-war years, while paper production, based on the first six months figures, is about 80 per cent, and cardboard 60 per cent of that of 1913, according to a statement of the Secretary of the Austrian Association of Paper, Chemical and Mechanical Wood Pulp and Cardboard Manufacturers.

A further indication of the recovery of the Austrian paper and allied industries is shown by the export figures. During the first 11 months of 1923, paper exports amounted to 85,230 metric tons (more than during the entire year of 1922), cardboard exports 26,400 metric tons, and paper products 5,580 metric tons.

* * *

The Belgian Paper Industry

In spite of competition from low exchange countries coupled with rising production costs in Belgium, the Belgian production of paper has made a favorable showing during the past year, and had it not been for a strike in one of the larger mills pre-war production would probably have been attained. As it was, a total of 118,800 metric tons of paper were produced during the first 11 months of 1923, the output each month ranging from 75 to 84 per cent of normal. In spite of the comparatively good showing made by the mills, exports were 57 per cent below pre-war normal and imports were considerably above not only 1913 but 1921 and 1922. The present unfavorable situation in the export trade is laid to the competition encountered from low-exchange countries.

* * *

Bovard in Australia

William M. Bovard, is at present in Melbourne, Australia, where he is installing and organizing a printing and wax paper factory. This work will probably consume the greater part of a year. Mr. Bovard is a graduate of Princeton and was formerly assistant production manager of the Taylor Logan Paper Company, of Holyoke, Mass. During the war he was in charge of the paper section of the Ameriacn University Experiment Station, Chemical Warfare Service, Washington, specializing on a porous paper for gas masks. Later he became chief chemist of the Emerson Laboratories at Springfield, Mass., after which he became technical director of the Package Paper & Supply Corporation at Springfield. For the convenience of any of his friends who might wish to get in touch with him the postal address is Box 190, General Post Office, Melbourne, Australia.

* * *

Newsprint Imports During January

Imports of newsprint into the United States during January amounted to 215,187,033 pounds, valued at $8,234,614, of which receipts from Canada amounted to 190,483,207 pounds, valued at $7,418,173. The other important sources of supply were Sweden, 9,916,457 pounds, valued at $317,437; Germany, 6,632,139 pounds, value at $223,559; and Finland, 4,978,409 pounds, valued at $168,109.

TRADE LEADERS ENDORSE GRAPHIC ARTS

Charles Francis Throws Full Weight of His Endorsement to Exposition

ENDORSEMENTS of the Third Graphic Arts Exposition, to be held in Milwaukee, Aug. 18 to 23, have been given enthusiastically by leaders of the industry throughout the country, men who have written their names at the tops of the profession. They believe that the exposition and the fifth annual convention of the International Association of Printing House Craftsmen are events which will do much to promote the great printing industry and industries allied with it. They see expansion of markets, advancement of methods, interchange of valuable ideas and they urge that every craftsman who can do so attend and that manufacturers and dealers give the exposition liberal support.

It is also announced at exposition headquarters at the Hotel Pfister in Milwaukee that replies have been received from more than 100 representatives of foreign countries and principalities expressing a keen interest and indicating that the international character of the event is constantly growing.

Charles Francis of the Charles Francis Press, Printing Crafts Building, New York City, is one of the enthusiastic backers of the exposition. He heads his statement "Taking Your Own Medicine" and brings out the point that while advertising in this country is absolutely dependent on the printing, lithographing and allied industries, still these great industries have themselves failed thus far to see the great value of their own "medicine"

* * *

To Be at Exposition

The S. K. F. Industries will exhibit at the Paper Industries Exposition occupying space No. 17 at Grand Central Palace, April 7th to 11th.

A range of Skayef Self-Aligning and Hess-Bright Ball Bearings will be shown also step operation of ball bearings and Atlas Steel Balls.

Ball Bearing Housings for Table Rolls, Dryer Felt Rolls and Fourdrinier Wire and Press Felt Rolls will be shown also a large Skayef Self-Aligning Ball and Spherical Roller Bearing.

Interesting models showing the anti-friction qualities of ball bearings will instruct and amuse while engineers will be on hand to answer questions about the application of ball and roller bearings to Paper Machinery.

The headquarters will be at the Waldorf-Astoria and the following men will be present:

R. H. De Mott, general sales manager; H. E. Brunner, chief engineer; G. H. Spencer, pulp and paper department; J. C. Gayler, pulp and paper department and R. C. Byler, advertising manager.

* * *

To Make Patterns

The Duraform Co., Inc., New Haven, Conn., was recently incorporated to make and deal in paper pleating patterns. Harrison A. Selfridge, M. Kipp and Malcolm P. Nichols, all of New Haven are the incorporators of the company, which is capitalized for $10,000.

* * *

To Make Boxes

The Packard Paper Box Co., Everett, Mass., recently organized to make paper boxes has an authorized capital of $15,000. Isaac Friedland, president, and Joseph Canter, 51 Felton street, Waltham, Mass., head the organization.

Through the Middle West

WISCONSIN FOURTH IN PAPER PRODUCTION

Facts Reveal That This State Is Progressing Fast In Making Paper

STATISTICS just made public by John D. Jones, Jr., Commissioner of Agriculture of Wisconsin, indicate that Wisconsin now ranks fourth among the states in the production of paper. Eleven per cent of all the paper manufactured in the United States comes from Wisconsin, these figures show.

The commissioner's report says that 16,218 men and women are employed in the industry in Wisconsin. The total capital invested in papermaking in Wisconsin is given as $118,908,660 and the value of the annual product is $88,546,541. Annual production of pulp in Wisconsin is 624,738 tons and value of which is given as $88,546,827. The annual payroll for those employed in the industry is $20,725,388.

It requires 1,086,616 cords of pulpwood to supply the pulp and 204,895 railroad cars are required for use by the industry each year.

Figures of the state department show that a large part of the output of Wisconsin's mills is print paper. The annual production of print paper in Wisconsin is 277,368 tons. The production of other paper is as follows: Wrapping paper, 186,288 tons; paper boards, 151,645 tons; tissues and toweling, 67,800 tons; bonds and writing paper, 44,445 tons; special papers, 68,355 tons.

Wisconsin is making the equivalent of 612 pounds of paper for each resident of the state, whereas the national per capita production is said to be 140 pounds. There are sixty mills in Wisconsin devoted to the manufacture of paper. They are located principally in the Fox River and Wisconsin River valleys where there is excellent water power. The first paper mill was established in Milwaukee in 1848. This mill was taken over by D. E. Cameron the following year and he boasted that his production of 112 reams a week was sufficient to supply all the newspapers of the state.

* * *

Safety Contest Ends

The safety contest between the Greens and the Yellows in the Kimberly mill of the Kimberly-Clark Company ended in a tie on March 1 and it has been decided to continue the contest another month.

The contest has been marked by unusual enthusiasm. The green division has been holding meetings in the clubhouse at which there is a singing and speaking program. Posters around the mill call attention to the contest and the spirit of competition has even communicated itself to the village where each team has its backers.

The yellow division recently put on a mock trial at the clubhouse. M. G. Hoovman, safety director, was placed on trial. He was "arrested" for neglect of duty and was ushered into the hall with a heavy iron ball chained to his leg. He was found "guilty" and "convicted."

Both sides have had several near-accidents, but none serious enough to be classed as an accident.

* * *

Spruce Coming In

Spruce pulpwood is beginning to arrive from Minnesota for the Grandfather's Falls Paper Company's mill at Merrill. A total of 10,000 cords has been contracted for delivery between the present time and midsummer and additional crews have been engaged to assist in the unloading.

Wisconsin Mill Notes

The first meeting of a class in foremanship training was held at the Appleton vocational school this week and attended by about 25 paper mill employees, all that can be accommodated.

* * *

The Consolidated Water Power and Paper Company is preparing for the spring breakup of ice at Wisconsin Rapids by cutting a channel to ease the strain on the dam and permit the ice to go out freely.

* * *

The sulphate process of making pulp was explained by R. M. Radsch, superintendent of the sulphate mill of the Thilmany Pulp and Paper Company of Kaukauna before the Industrial forum at the Appleton Y. M. C. A. this week.

* * *

Judson G. Rosebush of the Northern Paper Mills of Green Bay, presided at the recent meeting of the Central Region of the Y. M. C. A. at Chicago.

* * *

Construction work for the Peshtigo Paper Company having been completed, Harry M. Schmitt, who was in charge, has removed to Oconto, where he will engage in engineering work.

* * *

The George A. Whiting bowling team of Neenah, made up of paper mill men, recently established the highest record of the season when they rolled a score of 3,032 in three games.

* * *

The girls' club of the Kimberly mill of the Kimberly-Clark Company is an active organization with a basketball team, hiking club and ukelele club. About 40 girls are members and they attend all the mill's athletic contests in a body, their cheering being a feature of the games.

* * *

To Build Addition

According to reports in circulation in Menominee there is a possibility the Marinette and Menominee Paper Company may build its addition, which is to cost in the neighborhood of $200,000 at Oconto Falls, instead of in Menominee. The possibility of a change in plans is said to be due to failure to agree with the city on the vacation of a strip of land the city wishes to acquire. The city has made a tentative offer of a strip to be vacated in exchange for another strip to be acquired for use in straightening a street, but this is understood to be unsatisfactory to mill officials.

* * *

To Buy Power

The Northern Paper mills of Green Bay have been successful in completing a deal for purchase from the White Rapids Paper Company of Oshkosh of the White Rapids power and a large acreage of land, according to papers filed with the register of deeds here. The power is one of the largest on the Menominee River, engineers estimating that about 10,000 horse power could be harnessed there. The deal involves several miles of river front. It is understood that the Northern mills have a plan for the development of the power and its transmission to Green Bay where it would be used in operating the company's paper mill.

NEENAH MILL WINS THE CHAMPIONSHIP

Beats Out Kimberly In Playoff—Much Interest In Games

THE Neenah Mill of the Kimberly-Clark company at Kimberly, Wis., won the championship of the company's four teams in the basketball tournament conducted in the clubhouse here with teams entered from each of the cities where the company has properties. After a series of elimination games Neenah won the right to play Kimberly, and won an exciting game 16 to 14. The Niagara team humbled Niagara Falls 32 to 12.

Kimberly started off with a free throw, but Neenah followed with several baskets and when the half ended Neenah was in the lead 9 to 7. Early in the second half the Kimberly mill men caught up, but at this stage of the game Chapelle, Neenah's star, caged three baskets in rapid succession. Boettcher shot two through the hoop for Kimberly and two minutes before the final whistle blew Neenah was leading 16 to 14. Neither team was able to score in the last two minutes of play.

In the first game of the evening Niagara, Wis., has little trouble with the Niagara Falls, N. Y., team of the Kimberly-Clark company. The Wisconsin men played rings around the easterners although the New Yorkers fought hard up to the end. The superior teamwork of the Wisconsin players was apparent.

The Kimberly clubhouse was crowded to capacity both nights of the tournament and many were unable to crowd in to see the intersectional contests.

In the elimination contests the night before the play for the title, Kimberly defeated Niagara Falls, 29 to 18 and Neenah won from Niagara, Wis., 27 to 17.

* * *

Given Gold Watches

George Weyenberg of Kimberly and Edward Reuter of Appleton were present with gold watches Saturday night by the Kimberly Clark Company in recognition of saving a fellow workman, Michael Thiel, from possible death.

While at work in the paper mill last Thursday Thiel's arm became caught in a small canvas feed belt and he was thrown about sixteen feet over a calendar stack of a paper machine. His cries for help caused Weyenberg and Reuter to rush to his assistance and rescue him from further injury and possible death in the paper machine.

Presentation of the watches was made by S. F. Shattuck and M. G. Hooyman of Neenah, the latter being safety director of the mill.

This is the first time an award of this kind has been made at the Kimberly mill and is in accordance with the company's plan of rewarding those responsible for similar acts. It is the second case of its kind in the company's history. The first watch was given to an employee of the company's mill at Niagara.

* * *

200 Cars of Pulpwood

More than 200 cars of pulpwood have been distributed among paper mills of the Fox River valley this week, the Interlake Pulp and Paper Company of Appleton receiving a large share of it. The shipments of pulp started earlier this year than usual, much of it coming from a new district in Minnesota. Practically all of the wood shipped here last year was rafted across Lake Superior to Duluth and Ashland.

CLAIMS PAPER CAN BE MADE OF SUGAR CANE

Trying To Interest Capital In Mill To Make Paper of Waste Sugar Cane

CLAIMING to have perfected a process by which paper can be made from waste sugar cane and other grasses that grow wild in Florida, Capt. H. E. Ellis, of Miami, Fla., is endeavoring to interest paper men of Dayton, Ohio, and the Miami Valley in the proposed erection of a $500,000 mill in Florida.

Capt. Ellis, it is said, is the man who brought over from Europe the process invented by Dr. Carl Kellner, of Vienna, for producing bi-sulphate. He established two bisulphite mills in America.

He says he has been experimenting for seven years with the raising of napier grass, roselle hemp, sun hemp and bamboo and now is in a position to report that the sugar cane refuse is better adapted than any of those products for the manufacture of paper.

His sugar cane process, Capt. Ellis reports, makes an ideal mechanical pulp and a chemical pulp as well for newsprint paper or any other grade up to No. 1, book stock.

He points to the fact that a government investigation shows that about 4,000,000 cords of spruce are used each year in this country and Canada for lumber and the making of woodpulp and that at this rate, the supply will last only about 10 years.

He offers his sugar cane process as a substitute for the diminishing lumber supply. Capt. Ellis says that a free site for a mill has been offered him in Hileah, Fla.

Superintendents to Meet

The Officers and Committees of the Northwestern Division of the Superintendents Association are getting busy and arranging for their Spring Convention.

On November 18th the Committee met at Stevens Point, Wisconsin and decided to hold the Spring gathering at Marinette, Wisconsin, on Friday and Saturday, May 2nd and 3rd.

Mr. A. G. Stone of Marinette was selected as general chairman and has arranged to appoint his committee members immediately. As soon as they have accepted a list of those who will put on the event will be published.

Marinette and Menominee Mills, also those at Peshtigo and Octonto Falls are expected to be open to Association members on the days mentioned and a real live program for the two days is promised.

* * *

Fire At Paper Mill

Cinders left outside the Atlas Paper mill were responsible for a small fire at the mill on Sunday. The cinders, by heating through the mill, ignited a quantity of paper inside the mill. The blaze crept up the wall to the second floor and there set fire to more paper. The heat caused the sprinklers to discharge and because of the sprinkler system and with the help of chemicals used at the mill the fire was practically extinguished when the Appleton fire department arrived.

* * *

Was Instantly Killed

Max Haid, 74 years old, employed in the Outagamie Paper Company's mill here for 20 years, was instantly killed when he was buried under a quantity of paper stock he was removing from a machine. He was not missed for an hour when a searching party found his body.

* * *

Almost Instantly Killed

Louis Goldstein, part owner of the Massachusetts Waste Paper Company of Blackstone, R. I., was almost instantly killed recently while working in the baling plant when crushed by one of the power balers.

Dayton Convention

Great preparations are being made by the General Committee in charge of the Dayton, Ohio Annual Convention of the National Association of Pulp and Paper Mill Superintendents set for three days May 22, 23 and

The General Committe is composed of: H. W. Server, chairman; F. H. Henry, arrangements; John J. Maloney, reception; B. T. McBain, resolutions; H. D. Martindale, registration; Thomas E. Keogh, transportation and Tom Harvey, visitation.

The American Paper and Pulp Mill Superintendents Association is an Associate member of the American Paper and Pulp Association. Mr. Nelso R. Davis, superintendent of S. D. Warren Company Cumberland Mills, Maine, is the president, while Peter J. Massey of Chicago, is secretary-treasurer.

A very instructive program has been arranged for including papers by:

Howard S. Taylor of Dayton, Ohio, president of the Technical Association of the Pulp and Paper Industry and a general paper mill engineer of that city.

B. S. Summers of Port Huron, Michigan, a chemical engineer of high standing and for years making a specialty of paper making fibers for various purposes.

C. L. Cecil, a forest engineer of Duluth, Minnesota, will show the superintendents where they must look for their future supply of raw material, if there is to be any supply at all.

E. P. Gleason, general engineer of the Nekoosa Edwards Paper Company of Port Edwards, Wisconsin, will read a paper on paper drying, the one big subject now before the paper industry next to wood supply and waste.

George P. Hambrecht, United States Director of vocational education, will talk to the convention on his wonderful work for labor among those who have not been able to get all the education they want.

There will be many other subjects taken up, among them the Report of the General Standards Committee of Fifteen for Sulphite, Sulphate, Soda and Groundwood Pulps and a Kraft Pulp and Paper discourse by B. T. McBain, general superintendent and assistant general manager of the Nepco Mills at Port Edwards, Wisconsin.

The mills in Ohio district will have open house for the visitors and it is expected at least 50 per cent of the membership of some 1000 will be present.

* * *

On Visit to Wisconsin Mills

Mr. Walter E. Graves, Mill Manager of the Floriston California Mills, and Mr. George Frogner, General Electrical Engineer of all mills of the Crown Willamette Paper Company visited the mills in the Northern Wisconsin River Valley during the week of February 18th and the Port Edwards and Nekoosa Mills of the Nekoosa Edwards Paper Company on Monday February 25th.

Mr. Graves is a Pacific Coast man and has been with the Crown Willamette Paper Company and its predecessors for 21 years. Mr. Frogner is originally a Wisconsin man but for the past ten years has been connected with the big Pacific Coast concern.

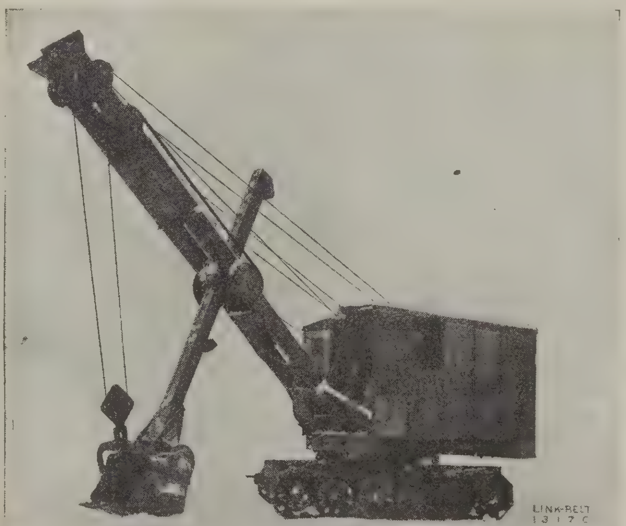
W. P. Fletcher Dies

William P. Fletcher, president and owner of the W. P. Fletcher Box Company, manufacturers of paper boxes at Stoneham, Mass., died in St. Petersburg, Fla., where he was spending the winter. He was born in Woburn 63 years ago, was for a time employed by the Woburn Paper Box Company and then started in business for himself, constructing the present large factory in 1891.



Type of Speedy New Crane

LINK-BELT ANNOUNCES NEW GASOLINE SHOVEL

Develops Shovel Attachment In Connection With Crawler Crane

LINK-BELT COMPANY of Chicago has recently developed a shovel attachment for use in connection with their gasoline crawler crane. This shovel boom-attachment is interchangeable and provides their crane with a far greater field of usefulness. Either attachment (shovel or crane boom) can be specified as original equipment, but however specified, the interchangeability of the booms makes the machine either a gasoline crawler shovel with crane boom attachment or a gasoline crawler crane with a shovel attachment.

The dipper is ¾ yd. capacity and is made entirely of manganese steel. It has been modeled after the famous "Mesaba" type of dipper used so extensively on the Mesaba Iron range. The standard dipper stick is 15 ft. long. The extremely husky boom is 24 ft. center to center.

All crowding motion is performed by a rack and pinion actuated by a very vigorous combination of the hoist and hold rope used on the ordinary clam shell bucket hoist. The full power of the 60 H. P. gasoline engine can be used in the crowding motion, making it, in this respect, superior over the usual steam machines with their small crowding engines.

ROSEBUSH BUYS CONTROL OF OUTAGAMIE COMPANY

Big Paper Mill Capitalist Acquires Valuable Property

Announcement has been made of the purchase by Judson G. Rosebush of Appleton, Wisconsin, vice-president of the Nekoosa Edwards Paper Company of Port Edwards, Wis., of the Outagamie Paper Company of Kaukauna, Wisconsin.

Mr. Rosebush acquired control of the Company by purchasing the interests of eight stockholders He was vice-president of the company before the new organization in which the capitalization of the company was increased from $400,000 to $675,000.

Mr. Rosebush is one of the largest paper mill capitalists in Wisconsin. In addition to his interests in the Outagamie Company and the Nekoosa Edwards Paper Company he is president of the Patten Paper Company of Appleton, Wis., treasurer and general manager of the Northern Paper Mills Green Bay, Wisconsin; president of the Inland Empire Paper Company of Spokane, Washington, and also has large interests in other paper companies.

Now Reorganized

Stockholders of the Continental Paper & Bag Mills, a corporation operating mills at Rumford, Me., at a special meeting held during the week at Portland, Me., voted to sell all of the assets of the company to a new corporation to be organized in Delaware and to be known as the Continental Paper Bag Mills Corporation.

The reorganization will not only include the holdings of the existing Continental company, but also the mills at Rumford, Me., of the International Paper Company in which about sixty per cent of the output has been used by the Continental concern in its own plant. The International company's plant at Rumford has been devoted to the manufacture of bag and wrapping manilas.

Deeds for the transfer of the property are in process of preparation. It is understood that there will be but little, if any change in the management of the Continental interests with the reorganization. The reorganization will go forward rapidly and is expected to be completed as soon as the charter to the new company is issued.

Paper and Board

New York, March 11—While it is true that a majority of paper mills in the United States are operating below capacity, which means that manufacturers could readily take care of additional business, it is also true that the market in its entirety is fairly active, that consumers are absorbing paper in a consistent manner although in somewhat limited volume, and that producers are managing to corral sufficient orders to warrant comparatively heavy production.

In some cases, of course, mills are enjoying demand necessitating full output. This especially applies to newsprint manufactories, which with few exceptions are producing at maximum or very close to maximum capacity. There is also a broad demand for bag papers, and for paper used in the building trades, roofing felt particularly. Such standard classes of paper as book, writing, wrapping and tissue are in relatively slower call, but this does not mean that manufacturers producing such papers are not running their plants at a good rate of capacity. Fine papers are gradually increasing in demand and mills are speeding up production to take care of the additional orders coming in to them.

Prices of paper of all kinds exhibit greater stability at present than has been the case in some months. One of the cardinal reasons for this is the situation which has developed recently in raw material. Practically every description of raw stock consumed in the manufacture of paper has risen in cost during the last few weeks. The advance in some materials has been sharp; rags of some grades, for example, are selling at prices twice above the levels prevailing only a comparatively short time ago. This strength in raw material obviously is having influence on the finished product. Manufacturers necessarily are less willing to shade prices on their product, and buyers who at one time had grown rather accustomed to securing the paper wanted at shaved prices are finding it more difficult to induce mills to grant the concessions asked.

Sentiment in the trade is in favor of a strengthening of prices of many descriptions of paper. It is contended, and doubtless is true, that paper is being marketed today at below the cost of production, and it stands to reason this condition cannot last indefinitely. Manufacturers might be persuaded to dispose of stocks on hand at prices which fail to show them a profit but

INTERNATIONAL
Wire Works

"The Fourdrinier that took the
Ire out of Wire"

INTERNATIONAL WIRE WORKS
MENASHA, WISCONSIN

they are not likely to continue producing at a loss. It is therefore felt that if raw material costs hold up to present levels—and it must be said there is at the moment no indication of any impending declines—paper prices must advance in proportion to the rise in raw stock. That this situation is appreciated by at least some of those on the buying end is inferred by the increased demand from some jobbers, who appear better satisfied to stock up paper than they have been, and also by certain consumers who seem more anxious to cover their needs ahead.

Newsprint is in steady movement and very firm in price. Mills in common are well fixed with contract business, and transient demand is developing in large volume. Roll news is moving into consumption in a volume closely approximating a record, and sheets and side runs are in good demand. Newsprint prices tend upward, and in some instances spot buyers are paying premiums, but no change of course is noted in the contract basis and there is not likely to be any since manufacturers have announced prevailing prices will be maintained for the first six months of this year.

Fine papers are picking up in demand, and the price tone is distinctly firm. The sharp rise in rag costs has necessitated manufacturers advancing quotations on some lines of bond and ledger papers, and the upward trend in values seems to be bringing buyers into more evidence.

Book paper is wanted in a steady way and prices are holding and are marked by more stability than in some time. Average qualities of machine finished book continue to sell at around 6.25 cents per pound f.o.b. New York, with quotations ranging half a cent per pound on either side of this figure, depending on the grade and tonnage, manufacturers being willing to grant some concession on orders for large quantities of book paper.

Wrapping is fairly active but the movement is no more than ordinary in point of volume. Tissues are quiet, and No. 1 white tissue is quoted at 75 to 80 cents per ream f.o.b. New York. Cover papers are in moderately good demand. Bag papers are active and tending higher in price. Building papers are in brisk call, with a big export movement augmenting the domestic demand.

Boards are showing fair activity but the efforts of mills to secure as large a part of the available business as they can even to the depression of prices make for irregularity in quotations. Chip board is quoted at an average of about $42.50 a ton f.o.b. New York, and news board at $45, with some manufacturers cutting under these levels on occasions.

Mechanical Pulp

There is a firming tendency in groundwood quotations. Reports are to the effect that a good many grinders have been obliged to reduce their operations because of frozen mill streams and a consequent lack of water supply, and with production curtailed and less pulp for sale on the market, values display a hardening tendency. Prime spruce groundwood is quoted by domestic producers at a minimum of about $35 per ton f.o.b. pulp mills, and it can probably be said that most sales are above this price, quotations ranging up to $40 a ton, depending on the air dry test and the freight to consuming points. Imported groundwood on the spot in New York and other American Atlantic ports is selling at $33 and $34 a ton ex dock, with a majority of importers trying to get $35 for such pulp.

Foreign and Domestic Chemical Pulp

Reports state that demand for chemical woodpulp is slowly though surely broadening. Since quoted prices have steadied at levels where even those on the purchasing side acknowledge

PULPWOOD AND WOOD PULP IN NORTH AMERICA

By Royal S. Kellogg

Author of "Lumber and Its Uses," "The Cost of Growing Timber," "The Timber of the United States"

270 Pages 87 Illustrations

A graphic presentation of one of the vital economic problems of the day—the securing of an adequate supply of paper.

This book is of special interest to everyone connected with the pulp and paper industry and equally so to all users of print paper. It points out clearly what must be done to develop sufficiently our supply of pulpwoods.

PRICE $4.00

Hughes Publishing Company, Inc.

1478 Broadway New York City

pulp is "cheap," and with manufacturers and importers in general insisting that bottom prices have been reached, consumers do not display as much hesitation about placing orders, while it also appears likely that consumption is on the increase, thereby bringing buyers into the market for more pulp.

While the tone of prices is stiffening, no actual change in quotational ranges has yet been recorded. Prices depend largely on the position of the seller, on how anxious he is to liquidate stocks, and also on the quality and tonnage of the pulp the buyer is interested in. Domestic bleached sulphite is quoted at 4 to 4.50 cents per pound f.o.b. pulp mills, with book grades available down to 3.75 cents, and No. 1 domestic unbleached sulphite at around an average price of 2.75 cents at producing plants. Domestic kraft is quoted at a low of 2.60 cents at pulp mills for Southern kraft, with as high as 3.25 cents asked for some qualities of kraft. News grade sulphite is selling at from 2.50 cents upward at pulp mills. Quotations ex dock New York and f.o.b. pulp mills are as follows:

Sulphite foreign—				Unbleached news grade	2.50	@	2.75
Bleached No. 1	3.75	@	4.25	Easy Bleaching	2.75	@	3.00
Unbleached No. 1	2.60	@	2.80	Mitscherlich, unbleached	3.00	@	3.25
Unbleached No. 2	2.40	@	2.60	Soda, domestic, bleached	3.50	@	3.75

Bleached No. 1	4.00	@	4.50	Sulphite screenings, refined	1.50	@	1.75
Unbleached No. 1	2.60	@	3.00				

Domestic Rags

Prices rule firm on practically every grade of papermaking rags. There is a good demand emanating from consuming quarters, and reports say that users other than paper mills are competing for supplies with papermakers, reflecting the high price of raw cotton and the substitution of rag products for this staple. Roofing rags continue to sell at around 2.60 cents per pound f.o.b. New York for No. 1 packing, and 2.40 cents for No. 2 grade, and dealers assert that demand from felt paper mills is running neck and neck with the incoming supply of such rags. New cuttings are firm and tending to advance. Dealers in New York quote No. 1 white shirt cuttings at 14 to 14.50 cents per pound f.o.b. this city, fancy shirt cuttings at 7.25 cents, washables at 5.50 cents, unbleached muslins at 12 cents, blue overall cuttings at 9.25 to 9.50 cents, and light silesias at 9 cents. Old blues and whites are in steady movement and fully maintained in price. Quotations f.o.b. New York are:

New Shirt Cuttings,				Overall Cuttings, Blue	9.25	@	9.50
No. 1	14.00	@	14.50	Washables	5.50	@	5.75
No. 2	6.75	@	7.00	New Black Mixed	5.00	@	5.25
Fancy Shirt Cuttings	7.00	@	7.50	Soiled Whites, house	3.50	@	4.00
No. 1 Whites, repacked	7.50	@	8.50	Soiled Whites, street	3.25	@	3.50
No. 2 Whites, repacked	4.50	@	5.00	Thirds & Blues, repacked	3.50	@	3.75
White Lawns	11.50	@	11.75	Thirds & Blues, misc.	3.00	@	3.25
New Muslins, unbleached	12.25	@	12.50	Black Cotton Stockings	4.00	@	4.25
Light Silesias	9.00	@	925	Roofing Rags, No. 1	2.60	@	2.75
Black Silesias	5.50	@	5.75	Roofing Rags No. 2	2.35	@	2.50

Imported Rags

Foreign papermaking rags are meeting with a consistent demand from various consuming quarters, and prices are firm. Importers generally quote dark colored cottons at 2.50 cents a pound or higher ex dock New York, and assert prices on these rags in Europe are rising. Blue cottons are in good call, and so are white linens. New No. 1 white linens are quoted at 15 to 16 cents per pound ex dock and old No. 1 white linens at 11 cents and higher. Prices on an ex dock New York basis follow:

Lins., White, No. 1	15.00	@	16.00	German Linen, blue	4.50	@	5.00
Ger. Blue Cottons	3.25	@	3.50	German Linen, grey	6.00	@	6.50
French Light Blues	3.50	@	3.75	German S. P. F.'s	6.00	@	9.00
New Light Prints	6.50	@	7.00	German Light Prints	4.00	@	4.25
New Unbleached	10.50	@	11.00	Dk. Colored Cottons	2.45	@	2.60

Bagging, Rope, Etc.

Both old rope and bagging are enjoying fair market activity and prices of these papermaking materials are ruling steady. Old manila rope of No. 1 domestic quality is bringing close to 6.75 cents a pound f.o.b. shipping points in most sales, and foreign manila rope is quoted by importers at 6.25 to 6.50 cents ex dock New York. Old bagging is moving chiefly to roofing paper mills at prices of around 1.50 cents a pound f.o.b. New York. Quotations f.o.b. this city are:

Gunny No. 1	1.50	@	1.60	Wool Tares, heavy	1.50	@	1.60
Foreign	1.40	@	1.50	For. Manila Rope	6.25	@	6.50
Wool Tares, light	1.20	@	1.40	Domestic Rope	6.50	@	6.75
Wool Tares, heavy	1.40	@	1.60	Mixed Strings	1.30	@	1.50
Roofing Bagging	1.40	@	1.50				

Old Paper

There is a fairly large movement of old paper to paper and board mills. It is noticeable that consumers are limiting their buying somewhat, seldom ordering other than in quantities ample to cover existing requirements, but demand is apparently large

The Pickles Drying Regulator
Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to

]

The economic problem of securing an adequate supply of paper

THE book is of special interest to everyone connected with the pulp and paper industry and equally so to all users of print paper. It points out clearly what must be done to develop sufficiently our supply of pulpwoods. It shows the steps necessary in forest conservation and discusses the subject from the practical viewpoint of industrial needs.

Pulpwood and Wood Pulp in North America

By ROYAL S. KELLOGG

Author of *Lumber and Its Uses, The Cost of Growing Timber, The Timber Supply of the United States,* etc.

270 pages, 6x9, 87 illustrations, $4.00 (*English price 20s.*) *net, postpaid*

The book describes the pulpwood industry, the processes of making paper pulp from wood, the timber supply of North America, the need for increased timber production and the future possibilities of the pulp and paper industry. Detailed statistics of production and consumption since the establishment of the industry are given in the appendix and shown in the text by means of graphic charts of unusual effectiveness. The book also carries many illustrations typical of mill operations and forest scenes.

Do You Know

That 100 million cords of pulpwood have gone into paper in the United States and 30 million cords in Canada?

That paper-making is a billion-and-a-half-dollar industry in North America?

That a permanently self-contained operation for the manufacture of 100 tons of news print paper daily may require the equivalent of an investment of $10,000,000?

That the United States and Canada produce and use as much paper as all the rest of the world combined?

That the per capita consumption of paper in the United States is 150 lb. yearly?

How much pulp may be made from a cord of wood?

How much pulpwood and wood pulp has been exported from Canada?

How much pulpwood and wood pulp has been imported into the United States?

What are the pulping properties of 70 species of American woods?

What are Forest Regions of North America?

How much and what kinds of timber there are yet left in the various regions of the United States and Canada?

How much forest land in North America is publicly owned and how much privately?

What regulations apply to timber cutting in the public forests?

What are the essentials of a forest "Working Plan"?

That forestry is the application of definite scientific principles to the growing and using of timber crops?

What it costs to grow timber?

Who is responsible for the maintenance of the timber supply of the United States and Canada?

What are the essentials of a National Forestry policy?

That without forestry there is no adequate, permanent supply of paper and other wood products in America?

That there is no sense in delaying the effort to maintain the American timber supply on the false assumption that we can turn to any other part of the world for any considerable part of the wood products essential to our well being?

Annual Convention Number of PAPER

To Appear Thursday, April 17

With a host of new features and all the old ones rejuvenated

DARD HUNTER TO HAVE INTERESTING EXHIBIT

Will Demonstrate How Paper Is Made By Hand at Exposition

THREE of the most unusual exhibits of paper ever shown will be among the features of the Second Paper Industries Exposition to be held in the Grand Central Palace, New York, week of April 7th.

Dard Hunter, famous for his unique work in handmade paper, the Seaboard Air Line Railway and the New York State College of Forestry at Syracuse, will provide these three unique exhibits of phases of the paper industry and its raw material problem Dard Hunter will be at the booth of the Paper Makers' Chemical Company, where he will actually make hand made paper during the week of the Exposition. No man in the country has done more interesting historical research on paper making than Mr. Hunter, and he recently produced a book on paper making which was an unusual one-man job, from the making of the paper, cutting of the types to the actual printing and binding of the finished volume. Mr. Hunter not only made the paper on which the limited edition of his book was printed, but devised the type, actually made the type, wrote the test and set the material in the type of his own manufacture. Then he printed the book on paper he had himself made by hand.

Mr. Hunter's work on early etching, watermarks, and other features of the paper making industry of an historical value has made him the leading figure in the industry in this particular line of work.

The exhibit of the Seaboard Air Line will be to show the possibilities of paper making in the South, but will have some most unusual characteristics. Not the least important will be the presentation of printed matter printed on paper made from every type of wood grown on the railroad's mail line and tributaries. The wood was shipped to the United States Forest Products Laboratory at Madison for test manufacture, and the resulting paper, in various grades, will be the basis of the railroad's exhibit. The purpose, of course, is to show the possibilities of the southern states as a field for paper manufacturing. The presentation, however, is so elaborate that it will attract wide attention from the public, and like Mr. Hunter's work will be of the most intense interest to the general public which will attend the Paper Industries Exposition.

The exhibit of the New York State College of Forestry is promised to be the most elaborate demonstration of forestry that has been shown in the history of the college. Two machines will give a constant change of illuminated pictures of pulp and paper manufacture, and the reforestation measures necessary to preserve the paper industry. The illuminated pictures will be accompanied by an elaborate set of graphs showing forestry conditions with another series of transparencies depicting woodlot problems and forest practice in vogue in different parts of the country.

The pictures and graphs will be cross-referenced by the use of ribbons leading from the transparencies to the wall charts. In addition, there will be actual displays of small trees, set off by green decorations.

The entire display will be of an educational nature, to show the relationship of forestry to the paper industry. Students of the paper course of the college will be in attendance to explain the exhibits to the visitors.

An article on "Creating Sales Through Expositions" in the February Advertising and Selling, particularly mentions the success of the Paper Industries Exposition, pointing out that its value is enhanced by the fact that the Exposition is held at the time when the American Paper and Pulp Association and allied associations are holding their annual meetings in New York.

In the paper machinery and supplies group advance information as to the type of exhibits indicates that there will be even a larger proportion than last year who will have operating machinery as a feature of their booths. The value of the Exposition as a means of working with the paper mill executives is not being overlooked by the big mechanical companies which have learned from experience that the Exposition method is a most satisfactory one for the demonstration of products, and for getting in contact with the paper mills which use their materials.

The advisory Committee before adjournment decided to send a letter to the entire industry indicating its belief in the Paper Industries Exposition, both as a means of educating the public and the consumer of paper as to paper problems, but of actually bringing about increased business to the exhibitors. The Committee consists of some of the best known of the manufacturers, merchants, supply men and engineers in the industry.

Moves to Larger Offices

Due to the vast increase in business, C. A. Wadsworth, sales agent for pulp, paper and mill supplies, has been forced to move into larger quarters. While he still remains in the Canadian Pacific Building, he has moved to another floor. He is now located at 830-40 Canadian-Pacific Building, 342 Madison Avenue.

* * *

Planning Complete Exhibit

The Cameron Machine Company is planning an unusually complete exhibit for the Paper Industries Show, which should interest everyone who makes, uses or sells rolls of paper or board. Three sizes of slitting and roll-winding machines, facetiously called "Uncle Dudley," "Buddy Bill," and "Little Pete,"—good, reliable workers all—will be shown. Visitors to the Exposition are urged not to miss Booth 6, to the right of the main entrance.

EVERY MILL EMPLOYEE

should keep informed as to what is going on in the paper industry. Knowledge is power, and power means prosperity. Any employee who uses his head as well as his hands serves his employer's interest best, and increases his earning capacity. Every paper mill employee in the country—therefore

DRYER FELTS
STANDARD and MULTIPLE PLY

ENGLISH WEAVE

In Two, Three, Four, Five and Six Ply, 60 inches to 176 inches in width.

BY ACTUAL TEST this felt will dry 33 per cent more paper, with ABSOLUTELY NO FELT MARKS IN THE PAPER.

TRIUNE
THREE PLY FELT for other paper

FITCHBURG DUCK MILLS
FITCHBURG - MASSACHUSETTS

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not only by what you put into the equipment but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged anywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

Paper Testing Methods (1922)

A large edition of this handbook for paper mill laboratories was exhausted shortly after the type had been distributed. In view of the insistent demand the Technical Association has arranged for a republication and *Paper Testing Methods* is again available at $3 per copy.

The work covers detailed procedure for microscopical analysis, physical testing and chemical analysis of the paper with descriptions of the apparatus employed.

It is the only complete and up-to-date handbook on paper testing published in the English language.

It should be in the hands of every paper manufacturer and paper dealer as well as concerns who are large users of paper.

Do You Want a Job?

Do You Want to Hire a Good Man?

Then Use PAPER Free of All Charge

PAPER

The Magazine of the Paper Industry

will run any advertisement in its newly established Clearing House for the Paper Industry under the classification of Help Wanted or Situation Wanted absolutely without charge.

PAPER goes to every paper and pulp mill in the land and to hundreds in other lands, also to every big paper jobber. Let it carry your message. The only charge will be the postage for remailing letters sent to box numbers to PAPER, 1478 Broadway, New York City.

They say there is nothing free in this world. The old order changeth.

Here is something valuable for nothing

USE IT

THE CLEARING HOUSE
OF THE PAPER INDUSTRY

Situations Wanted, Help Wanted, Machinery for Sale, Machinery Wanted, Business Opportunities, Materials Wanted and For Sale, Business Wanted or For Sale.

Advertisements in this department cost $1.00 for 25 words or less, payable in advance. Additional words, two cents each. This price covers the cost of remailing answers directed to boxes, care of this office. Matter for insertion should reach the office of PAPER not later than the Saturday preceding date of issue.

All Advertisements under the Situations Wanted or Help Wanted Classifications are published FREE OF CHARGE, except for cost remailing letters addressed here.

POSITION WANTED by young man who is familiar with the paper industry, chemistry, dyes. Write, giving salary and position you have open. Address Box 1278, care of PAPER.

PACIFIC COAST SALESMAN with established business relations covering several years as Pacific Coast representative of Middle West paper mills, desires connection with mills on Atlantic seaboard making writing, wrapping and specialties. Only first class lines considered. Address Box 1279, care of PAPER.

MISCELLANEOUS

WANTED—A paper company to locate a large pulp and papermaking plant in North Carolina, with a million cords of pulp wood deliverable at the plant at $3.75 a cord, a saving of $20,000,000. Lands for plants, fronting **deep water for deep sea** loading. Millions more cords of wood available very cheap. A clear stream of fresh water free for washing pulp. Address Box 245, care of PAPER, 1478 Broadway, New York City.

FOR SALE

Beaters—One N & W 48x48 rolls, 21″-6″. Two iron tub rolls 52″x40″.

Bed Plates—Large lot, all sizes. New.

Calenders—One 7 roll 72″; one 9 roll 72″; one 5 roll 78″; one 7 roll open side 84″. One 7 roll 124″.

Calender Rolls—Large assortment, all sizes; one 14x86″; one 18x84″; one 18x100″ and many others.

Coaters—One 45″ Waldron, double coater, and others.

Cutters—One 38″ Guillotine.

Cylinder Moulds—One 36″72″; one 30″x52″; one 12″x22″.

Drives—One No. 1 Reeves Class E; two No. 3 Reeves Class E, 4 to 1; one No. 3 Class E; one No. 6 Large Reeves; one No. 10 Reeves, F-3 to 1 with extra disc.

Dryers—48x116.

Exhausters—One Sturtevant.

Fans—3 Hunberry; 2 Perkins.

Jordans—One N & W Monarch, with new shell two Horne; two Emerson, large size, one base; one N & W Pony, with extra plug.

Pulleys—One 98″x34″ face, double arm, modern, Iron pulleys; Cone pulleys for Marshall Drives.

Pumps—One dry suction Knowles 12x22x18; one 1000 gal. Blake Tank pump; two Lawrence Mch. Co.'s Class A 8″ high duty; two 6″ Emerson make; one 4″ Centrifugal; one Type 4 Gould 5″ triplex, self contained. Two Lawrence Machine Co.'s Class A, No. 4, double suction pump for high elevation or for low speed. Thoroughly rebuilt and ready for shipment.

Press Rolls—One pair new, one RC 18x80″; one Gun metal 18x81″; one 16x75″; one RC 15½x73½″.

Rag Cutters—Two No. 2 Daniels; one Perkins.

Screens—4-8 pl. New Success.

Slitters—One 86″ P & J.

Winders—One 86″ P & J; one 100″ P & J; one 112″ M & W.

Wet Machines—One N & W with cut offs, mould 30x52″; two spare moulds.

One set Dillion Doctors for 80″ calender rolls.

MILLS MACHINE COMPANY
Lawrence. Mass., U. S. A.

THE CLEARING HOUSE—Continued

MISCELLANEOUS

WANTED—A second hand 80 or 84 inch Fourdrinier paper machine in good condition. In reply state full particulars and price. Address Box 1284, care of PAPER.

WANTED—A 2nd Hand Improved Machine Company's Standard Wet Machine with a single cylinder mould 36"x84". Must be in good condition. Address Box 1281, care of PAPER.

WANTED—A Niagara 2nd Hand Beater of 1500 to 2000 pound capacity. Must be in first class condition. Address Box 1282, care of PAPER.

SALES AGENT with ten years' experience in paper mills and several years' selling experience, having steady outlook for considerable straw, chip and test jute, container board tonnage, desires to represent mills on commission basis in metropolitan district; highest references. Address Box 1286, care of PAPER.

TECHNOLOGIST in stained paper field, about 30 years' practical experience, specialist in paper, cardboard and paper board fields. Can furnish formulae. Solve manufacturing difficulties and install new improvements, particularly in the following fields—glazed paper, chromo papers, art printing papers, stained paper, marbled paper, carbon paper, waxed paper, etc. Can secure all materials as well as machines. Regular technical advice given.

WILHELM REINICKE,

THE IDEA OF DOING ONE THING WELL

Cameron Machine Company Will Exemplify This At Convention

THE steady growth of a business which has been built upon the idea of doing one thing well will be graphically shown in Booth Number Six at the Paper Industries Exposition. There the Cameron Machine Company, manufacturers of slitting and roll-winding machines exclusively, will show three of their CAMACHINES, representing three main types for the production of small, medium and large rolls of paper and paper boxes.

CAMACHINE 6 will be in operation, actually making miscellaneous small rolls during the exposition. The Cameron principle of slitting and winding, which is a characteristic of the entire line of Cameron Machines, is exemplified thereby.

A CAMACHINE Type 10 will represent the middle stage, both in size of rolls produced and in the progress of development towards the high speed mill types, Camachine 12, Camachine 14 and Camachine 18. This CAMACHINE 10, a standard machine for rolls of medium size, demonstrates that a roll-winder of this capacity is advantageous in a great many mills, converting plants, and paper warehouses, as well as in factories manufacturing paper products.

Although both of these machines are being used in paper mills throughout the country, the mill men who attend the exposition will be particularly interested in the CAMACHINE 18, the big brother in the Cameron family. The experience of many mills attests that these Type 18 CAMACHINES will do everything that a winder has to do—*plus some more*—whether used as a prime winder behind the reels of the paper machine or as a rewinder for finishing room service.

The exhibit shows a portion of the Cameron line of winders and rewinders which backs up the Cameron slogan "A winder for every roll requirement."

In addition to the machines themselves, a representative exhibit of rolls of different sizes and various kinds of paper, all made on CAMACHINES, will be shown. A new booklet, describing and illustrating all of the CAMACHINES used by the paper industry and its allied branches will be distributed.

Every effort has been made by the advertising department to have the exhibit as attractive, complete and informative as possible. W. B. Wilshusen, sales manager, will be in charge, assisted by Messrs. J. B. Venturini, W. E. Blauvelt, and J. E. Regan of the sales staff, as well as by Messrs. Schatten, Schuller and Hawkes, who will demonstrate the machines. Jas. A. Cameron, president of the company, will be there to greet his friends and make new ones. A successful exhibition is looked for; one which will do its bit toward making 1924 a good business year for the paper industry.

* * *

Examining China Clay

Since china clay enters into such manufactures as paper filling, etc., says Mr. J. M. Coon in the Journal of the Royal Microscopical Society, it is important to have it free from impurities, but although chemical and mechanical analyses have their good purposes a microscopical examination is extremely valuable as a guide. Elutriation grades the sizes of particles to some extent, but it will not differentiate between the actual mineral constituents. The above writer prefers to examine samples microscopically in a castor oil medium, although water and Canada balsam may be used. A few milligrammes of the sample are put on to a slide, and a drop or so of water added and carefully mixed. If oil is used as the medium, the slide must be dried, and an examination made first with 1 in. objection, followed by ¼ in., and then ⅛ in. The various minerals are then looked for, regarding all such as impurities. The paper is illustrated with figures of the likely mineral constituents.

* * *

Force vs. Persuasion

Fundamentally, advertisers are dealing with people, not with things; with ideas primarily, rather than facts. This is unfortunately is not always appreciated and as a result a good deal of copy falls short of what it was meant to accomplish. Too often manufacturers insist upon approaching their subject from their own viewpoint, which may not be that of the purchaser at all. Too frequently, also, they lose sight of the idea they wish to plant in the mind of the reader in the effort to build up an overwhelming array of hard facts. The idea of desirability is most easily created by a smooth and easy style of writing which pleases the reader's taste without obtruding itself upon his consciousness. Yet this is frequently sacrificed as a matter of no consequence as compared with the dull and stony facts which represent mere force in place of persuasion. The copywriter tears his hair in private, perhaps, and the great mass of the public exercises its normal, human faculty of taking no notice of that which does not seem pleasant to the taste.—*Advertising Fortnightly.*

* * *

Get A Map

If you want to get a clear picture of how much a manufacturer wastes when he advertises in a large-circulation medium, take a large map of the United States and stick a tack in every town where he has distribution; then compare the number of tacks with the number of towns on the map. The untacked towns get the publication but the people in those towns cannot buy the goods even if they want them, says A. Booster in the *Ambassador.*

The publisher may tell you that advertising will establish markets in these towns where distribution is lacking. Perhaps it will, in time, but distribution may be more economically established first, and then general advertising will come into its own.

Government Bids

Treasury Department, Bureau of Engraving and Printing, Washington, D. C., March 1, 1924. Sealed proposals are invited to furnish Dextrine, Oils, Textiles, Dry Colors, Paper Boxes, Paper and Check Paper, during the fiscal year beginning July 1, 1924. The right is reserved to reject any or all bids or parts of bids. Samples of Dextrine, Oils, Textiles and Dry Colors must be received at the Bureau of Engraving and Printing not later than 2 P. M., Wednesday, April 9, 1924. Samples of Paper Box Blanks, Paper and Check Paper, must be received not later than 2 P. M., Monday, April 7, 1924. Blank forms with specifications for proposals, giving dates on which the bids for the several schedules will be opened, and further information will be furnished on application to Paul E. Twyman, Assistant Director.

ISMAR GINSBERG, B.S., Contributing Editor

A Few Stray Thoughts

The manufacturers and the workers in the mills having filed their income taxes in the last minute rush, and having reported their millions of profit as a result of the vast business done in the last year——

You finish it. Someone just hurled something at us.

* * *

Now if President Coolidge attends to his important mail and reads that gentle persuader from PAPER appearing in this issue, and he then ponders over it and decides to follow its suggestion—what a rosy, glorious world this will be. If he does follow out those suggestions, we can pledge the entire paper industry vote to him at the election.

* * *

We feel compelled to emit a word of praise to the *Paper Trade Journal* for the changes for the better it made in its last issue. A new cover plate, a new color, a new department—all vastly improved the already good magazine. There is life in the old girl yet.

By the way, this stuff about never mentioning your competitor in your columns is all bunk. The general attitude is that mentioning a competitor's name will turn the paper black or place some variety of poison on it. We just naturally like to tempt the fates anyway.

* * *

Do you realize how short the time is before the annual convention of the American Paper and Pulp Association takes place in the Waldorf? April 7 is not so far away as you might think and it is always well to remember that tempus has never been known to knock off on the union hours of fugiting. Make your reservations at once. The big Paper Industries Exposition will also be held that week in the Grand Central Palace. Besides all the integral associations of the big organization will also meet that week. Remember these dates also:

The National Paper Trade Association has its convention at the Waldorf-Astoria April 8-10.

The Technical Association will be in session from the 7th to the 11th, also at the Waldorf.

The Salesmen's Association will hold its convention at the same hotel from April 7 to April 10, ending it one day previous to most of the associate conventions.

* * *

As if the flood of German paper is not sufficient, the paper franc had to rush downward in an attempt, probably, to make itself as cheap as paper now is in America.

* * *

Quite the most striking term that has appeared recently was "paper bootleggers." It isn't to be found in this combined series of nomenclature recently published, but it has just as much weight and spirit.

* * *

According to the late reports, only a little over half the newsprint consumed in the United States was manufactured here. With 2,800,000 tons used last year, but 1,506,204 tons were manufactured here. It was not so good as it might be, but it was a better balance than the year before. Progress is something.

* * *

Lord, let the light of Thy countenance shine into the consciousness of one Calvin Coolidge and show him the tremendous need of better protection to the American paper industry. May he see things clearly and comparatively so that the palpable injustices to this industry may be brought out. May he temper his justice with mercy.

And, above all, may he do something for us.

Porosity Testing of Paper

Further Comment on an Article That Has Attracted Wide Notice—Notes on the Origin and Development of the Porosity Testers Known as Densometers

By **F. E. GALLAGHER**

John A. Manning Paper Company,
Troy, N. Y.

IN the February 14, 1924, issue of PAPER, appeared an article on "The Degree of Porosity of Paper" by V. Ravizza. The article was republished from the Italian journal, *Industria della Carta.*

The subject of porosity testing of paper is unquestionably one on which there should be wider knowledge in this country and you are to be commended for presenting the subject even from so distant a source. Mr. Ravizza's article was principally devoted to a classification of instruments that could be used for porosity testing and a critical analysis of the merits or disadvantages of the different types.

The following historical comment might be offered as a supplement to Mr. Ravizza's paper:

The suction type of apparatus shown in his Fig. 4 as that proposed by the Electro-Technical Association of England is identical with a design first developed in this country by the John A. Manning Paper Company, of Troy, N. Y., for the testing of rope papers for technical purposes including electrical insulating paper. In this way it was introduced into the American electrical industry and has apparently been transferred to England without change. It was constructed from the well known Hemple gas burette. This form of porosity tester was open to the serious defects.

(1) That the vacuum changed throughout the test so that readings were not proportional to variations in actual porosity.
(2) The instrument being of glass was readily breakable.
(3) The glass instrument with rubber tubes could not be accurately standardized.
(4) The time interval required to make a test was so short that accurate tests could not be made with certainty or convenience.

Because of these serious defects and on account of a greatly increasing demand from customers and friends for instruments that would give comparable tests, the problem of making a simple, unbreakable and accurately standardized instrument was turned over to the W. & L. E. Gurley Company, skilled instrument makers, of Troy, N. Y. They produced the form of porosity tester known as the "Densometer" and referred to by Mr. Ravizza as the "Gurley and Troy" instrument. This instrument is constructed entirely of aluminum in the form of a miniature "gasometer" and the air is supplied at practically constant pressure by the weight of the upper or floating cylinder.

Mr. Ravizza quotes Professor Herzberg as attributing the following disadvantages to this apparatus:

(1) Moisture from the air delivered under pressure over water is taken up by the paper fibers and affects the test.
(2) The pressure is not constant throughout the test.
Although the reason for the latter is not stated, presumably it would be due to decrease of weight of the floating cylinder due to gradually deeper immersion in the water of the outer cylinder.

Although our long experience with this instrument indicated clearly that these theoretical considerations were of immaterial importance in actual operation, we have made a careful series of tests to check up on the two points.

A sample of paper was put in the clamp at the top of the densometer and was left in place without change throughout all the tests. An identical paper area was therefore being tested.

Series I.—Twenty-one readings were taken with a non-aqueous solvent, ethylene glycol, as a sealing liquid in the outer cylinder. The average of 21 readings was 38.7 secs. for 50 cc. Lowest reading, 36. Highest reading, 41.

Series II.—Sixteen readings were taken with water as the sealing liquid. The first set of eight tests gave an average of 38¾ secs., the second set of eight tests gave an average of 39 secs., grand average 38.9 secs. Lowest reading 38 secs. Higher reading, 40 secs.

Series III.—The water was covered with 1/16″ of oil to prevent contact between the water and the air. Average of sixteen readings, 39.2 secs. Lowest reading, 37 secs. Highest reading, 40 secs.

All of these readings are within the general operating accuracy of the instrument. Even on a check test of this kind, moisture in the air under pressure is negligible in affecting the test. It would be even more negligible in tests on different samples or different parts of the same sample, which in themselves show considerable difference in porosity.

Tests were made to check up the second of Professor Herzberg's criticisms, that the pressure was not constant throughout the test.

The densometer is calibrated in 50 cc. intervals up to 400 cc. A series of readings throughout the complete travel of the cylinder was as follows:

Cubic Centimeters	Seconds
0-50	38
50-100	38
100-150	40
150-200	39
200-250	39
250-300	39
300-350	39
350-400	40

The variations due to the water displacement of the thin-walled upper cylinder are negligible and of no practical importance in porosity testing.

One of the very attractive points in the design of the densometer is the ease of obtaining on the same test check readings for consecutive 100 cc. intervals.

As a matter of practice we use ethylene glycol instead of water as a sealing liquid, since it prevents corrosion of the aluminum cylinder.

Putting the Spring Floods to Work

A Most Timely Subject Handled Ably by a Man Who Knows the Game

By R. H. ROGERS

Industrial Engineering Department, General Electric Company

THE utilization of power which runs to waste when the spring thaws fill streams and rivers to overflowing and send solid sheets of water over the dams, is becoming more and more an economic necessity. People think a good deal today about the conservation of coal and oil and other sources of power, and the conservation of water power is perhaps the most easily accomplished. It requires regulatory devices, which nowadays are usually tied up with flood prevention.

But because of a lack of proper flow regulation there are millions of horse power in "white coal" permitted to run away every year, often wreaking considerable destruction in their course, when they could profitably be put to use to turn the wheels of industry.

This waste power will successfully be utilized at the hydro-electric plant of the St. Croix Paper Company on the St. Croix River, the international boundary between Maine and New Brunswick. The plant is twelve miles from the company's mill. In spite of extensive flow regulation works on the St. Croix River and its tributaries for fifty miles back, there is every spring a big waste of water at the power house dam. Water over the dam does no one any good.

This potential energy might be stored up in retaining basins, but they would be too large and expensive to be practical. It might be converted into electricity and held in huge storage batteries but this scheme would be more impractical than water storage. The St. Croix Paper Company plans to enlarge its hydro-electric plant so that the waste water may be diverted to a useful purpose instead of going over the dam—converted into electricity and then into wood pulp during the flood season.

The pulp will be stored away as dry pulp laps, and when the inevitable drop in water power comes during the dry summer and fall months, it will be made into paper. This practically amounts to storing excess power and using it during a period of low water power.

As an auxiliary feature, electric steam generators will be installed later, so that some of the excess water power can be converted into steam with a consequent saving of very expensive fuel in the paper mill boiler house, steam being very essential in the manufacture of paper.

The General Electric Company has on order for St. Croix Paper Company a 3360-kw., 2400-volt vertical waterwheel generator, and an 1800-h.p., 2200-volt synchronous grinder motor with all the necessary exciters, switchboards, etc. The generator equipment will have to be hauled four miles over the old power station construction railroad by teams of horses, as the track is in such condition that it will not hold up a locomotive.

This so-called "high water" generator will be operated every year at full load for about three months, and at reduced load for another three months. During some seasons it may be in operation for nine months.

The present wood grinders at the paper mill are part motor driven and part waterwheel driven and of the pocket type. The new motor will also drive pocket grinders, but they will be arranged so that magazine grinders may be installed at some later date.

This conservation plan carries with it three things: Power-factor correction by the synchronous grinder motor; the utilization of otherwise waste energy by working up raw material in advance of its requirement; and the substitution of an amount of electrically generated steam for the steam ordinarily produced by burning coal. Manufacturers of all sorts having water power plants might profit by a study of the St. Croix plan.

Prof. Wise on "The Riddle of Cellulose"

Takes Issue With Statement in Previous Article on Cellulose

My Dear Mr. Keenan:

Thank you for sending me the article entitled, "The Riddle of Cellulose," which forms a very interesting presentation of a subject that has been bothering us for a long time.

You have asked for a frank criticism of this little article and I would like to point out one or two statements with which I do not entirely agree.

I fear that chemists have not *in general* accepted the thesis that celluloses of different origin whether from cotton wood, or straw are identical in chemical properties. If you could listen to some of the arguments advanced by my friends at the Forest Products Laboratory I think you would see exactly what I mean. Quite a number of the chemists of continental Europe have agreed that there is probably one type of unit (which occurs largely in cotton cellulose) which occurs in the cell walls of most of the higher plants. I am also of this opinion, but I am afraid that quite a number of my American colleagues are in the opposite camp and feel that there are quite a large number of different celluloses.

May I also point out that your statement that the molecule of cellulose is very large might perhaps be misinterpreted.* The very paper which you refer to in your article, namely the one by Hess, Mesmer, and Weltzien would actually indicate that the cellulose molecule is comparatively small, possibly smaller than the glucose molecule. True, the cellulose molecules associate to form a huge cellulose aggregate but presumably the units which combine in this way through the agency of residual valence are in themselves reasonably small.

Have you noted the recent work from the St. Andrews Laboratory in which Principal Irvine has shown that the main component of esparto is identical with cotton cellulose? This of course supports the opinion of identity of celuloses from various botanical sources and I wish to point out again that I am strongly in favor of this as a working hypothesis, but I do not feel that it has been one which has been generally accepted by our cellulose chemists.

LOUIS E. WISE.

The New York State College
of Forestry at Syracuse University,
Syracuse, N. Y.

---

*Professor Wise is right, and the reference to the cellulose molecule as being very large was out of place. It should have been used to denote an abandoned hypothesis.—ED.

Imports and Exports

Fourth in a Series of Articles on a Situation That Is Vital to the Life and Welfare of the Paper Industry

The Big Issue of the Year

THAT the trade balance in favor of foreign countries is gnawing at the heart of the American paper and pulp industry is shown by the cold figures that have been issued during the last few months. Exactly how it is operating is not so plain and clear. This is the dark and devious part of the situation.

But its importance and its far-reaching effects cannot be over-estimated. The mere fact that the American Paper and Pulp Association has temporarily stopped the operation of its Information Bureau so that the indefatigible Warren B. Bullock could be put on the trail of the "paper bootleggers," as it is succinctly put, is indisputable evidence that not only is there something vitally wrong, but that only the most exhaustive and stringent efforts are sufficient to remedy this wrong. It is well to say here, also, that this situation will be the biggest issue to be brought before the annual convention of the Association and its complementary organizations.

Mr. Bullock is gradually turning himself into a veritable bulldog in the interests of his investigation into this "bootlegging." He is on the job to stick. He bases his logic for calling it bootlegging on the fact that if smuggling liquor into the United States in violation of the law is bootlegging, then smuggling paper into this country in violation of the law, whether under a wrong classification or label is bootlegging.

Scouring the Ports

For days he has been traveling throughout the eastern portion of the country gathering evidence. He has visited Boston, Washington, Baltimore, Philadelphia and has been doing much in his home port of New York. Wherever he goes he finds that certain unscrupulous importers are making every effort to bring paper into the United States under a misclassification. In uncovering these disclosures he is finding that, although the customs authorities are both honest and efficient, it is impossible to prevent themselves from being deceived. In other words, crookedness can always find a way.

Mr. Bullock found that paper is being imported under one name, with little or no import tax and then sold as a much better product. In this way the government is swindled, the customer is swindled and the American paper industry is grievously injured in prestige and intrinsic loss. One glaring violation and misclassification he uncovered was in a huge shipment from Germany. German imitation parchment paper was sent here under the label of wrapping paper. This was so palpably a misrepresentation that legal action will result.

It has been found in investigating the cases that not only paper is being offered in unfair competition, but that the innocent and tax-free pulp is being discriminated upon. Some railroads are granting free storage to pulp brought in, awaiting a sale or a market. This is a pure violation of law, and is tantamount to a rebate by these railroads. Formal complaints are being filed in cases of this nature.

Evidence Needed

Everywhere the investigation leads to, it brings dead up against the proposition of the gathering of evidence. The customs officials have only a skeleton organization for the gathering the loose ends of violations of the law. The appraisers, while wide awake and ready and willing to prevent fraud are essentially appraisers, not detectives.

PAPER has frequently reiterated that it is squarely up to the paper manufacturers to secure the evidence that will eventually prevent the undermining of their business. While the tariff laws are what they are, the least that can be hoped for, is a strict interpretation and enforcement of the law as it is written.

The Anti-Dumping Act was not repealed when the new tariff law went into effect. It was closely incorporated in the 1922 tariff law. It shows that Congress anticipated efforts to dump goods on the American market. It shows that there was a well defined fear of exactly the present situation.

The Other Side

So that the matter may be considered from an impartial viewpoint, a representative of PAPER has talked with importers. They say that the claimants of vast law violations in regard to dumping are afraid of a bugaboo, a wraith. They say there is no such thing as wholesale dumping on the American market. The contention is the American paper industry is afraid of its own shadow just now and that because it is nervous it is trying to throw the blame on foreign countries, Germany, in particular.

One ardent importer of German paper has said that Germany is bringing a benefit to America by sending paper here cheaply, that it makes the price low and the buying public pleased and that the American paper manufacturers are only jealous.

It is pointed out by the importers that only the one case, mentioned previously in PAPER, concerning alleged dumping of Norwegian kraft paper, was ever brought to a hearing, and that this was thrown out because of lack of evidence.

A strong case is put up by the importers. Because they are able to undersell the American papermakers, they are gleefully laughing in their sleeve and frequently openly. They are making hay while the sun shines, and they admit it. They will naturally continue to do so as long as the beneficient government of the United States permits them to do so.

It is squarely and obviously up to the organized paper industry to take the necessary measures to see that the law is carried out to the letter. That is the least that could be done when no stone should be left unturned to protect the industry.

A step in the right direction appears to have been taken tentatively, which will be discussed further at the annual convention. It is the so-called Wise plan, because it originated in the head of Henry A. Wise, one of the ablest legal defenders of the paper industry for many years. This plan will, very briefly, provide a bureau or a commission to handle this phase of the battle against business invasion. The industry would then be prepared to handle the question in a business like and thorough manner.

At the present moment, the import question is being discussed with a tremendous vehemence. Over a long period the agitation was passive. During recent months and weeks, due partly to the activity of the American Paper and Pulp Association, partly to PAPER and partly to other agencies, it has again become a question of much importance and it is being discussed as the prime knotty problem of the industry.

Forensic Paper Chemistry

A Study of What Can and Cannot Be Done With Paper, Which Will Be Interesting to Every Papermaker

By A. PAPINEAU-COUTURE

Papermakers have long studied paper from the standpoint of what goes into it. Here is a study of what goes on paper and whether it can be taken off without detection. It is translated from Lu Papeterie, of November 10, 1923. The new phases it takes up make it an engrossing contribution to American paper literature. It is well worth reading by all of PAPER'S *readers.*

THE detection of attempts to tamper with documents, either as regards the writing or the paper itself, is usually a delicate and difficult matter. We therefore consider it will be both interesting and useful if we briefly summarize the results of some very careful investigations which were undertaken to try to prove whether or not a portion of the paper examined has been strongly and unevenly wetted, and if attempts were made to erase pencil writing, in other words, if the paper has been rubbed.

When dry paper is subjected to the action of iodine vapors it assumes a different color from that of the same paper which has been first wetted and dried and then subjected to the action of iodine. When a sized and calendered paper is partially wetted and dried, and then subjected to the action of iodine vapors, the portions which have been wetted assume a violet tinge, whereas the portions which did not come in contact with water become yellow or brown. The intensity of the coloration naturally varies with the time of treatment with iodine. This experiment is readily carried out by placing the paper to be examined over a suitable dish containing some iodine in the bottom.

The phenomenon can still be observed quite clearly when drops of water are allowed to fall on the paper and to evaporate spontaneously so as to affect the surface of the paper, which is then heated to 100 deg. C. to dry it completely. If the paper thus treated is then immersed in water after exposure to iodine, the portions which were originally wetted assume a very intense violet blue coloration, while the portions which remained dry before iodine treatment become blue.

If drops of water are allowed to fall on paper and to evaporate spontaneously and the paper is subsequently completely immersed in water and then dried, on treating with iodine vapors the spots caused by the first drops of water can still be detected, either on the dry treated paper or after wetting it. In the latter case, that is, when the paper is wetted after exposure to the action of iodine vapors, the spots are scarcely perceptible as long as the paper remains wet, but on drying again the outline shows up clearly in a light shade on a darker background.

This reaction allows of obtaining the effects of sympathetic writing merely by writing with water on a sized and calendered paper, and allowing it to dry. On treating the paper with iodine vapor the writing stands out clearly in a violet brown on a yellowish background, which on wetting changes to dark blue on a light blue background. The writing is immediately decolorized by the action of sulphurous acid. It can be made to reappear after a first bleaching provided the paper has not made to reappear and disappear at will, or which can be made to reappear once and then disappear completely.

Iodine has been known for nearly a century and paper is in common use and is handled by practically every one in large quantities. The above described reactions have perhaps been known for quite a long time but were not published (at least to our knowledge), presumably because they seemed too simple and of no interest or value. But we shall now show wherein they can be of great value in showing up various manipulations to which paper may have been subjected.

When examining paper to try to find possible forgeries or other tampering, it is generally carefully examined by transmitted light or by glancing light, that is, the paper is placed practically in line with the source of light and the eye of the observer. If the paper has been rubbed energetically so that part of the material of the paper has been removed, on holding it up to the light there will be a light spot at this point. While if the rubbing has been done carefully, it can sometimes be detected by glancing light, the rubbed portion being more matte or duller on account of the displacement and partial raising up of the fibres above the surface of the paper.

If bread crumbs are used for rubbing, instead of an ordinary eraser, and if care is taken always to rub in the machine direction of the paper, it may be impossible to detect this merely by looking at the paper, no matter how carefully, especially when the rubbed portion has been written over, either in pencil or ink.

But iodine vapor shows up such manipulations very clearly, the rubbed portions assuming a brownish yellow or violet brown color, and the outline of the rubbed area showing up quite sharply.

If the rubbed paper is wetted after having been subjected to the action of the iodine vapor, the rubbed portions become blue, the depth of the color depending on the length of time the iodine was allowed to act; and on drying it can be observed that these portions are of the same shade as the remainder of the paper, but are usually darker.

On the other hand, if the paper has been rubbed so hard as to remove a part of the material of which it is composed, after treatment with iodine, wetting, and drying, the rubbed portions will appear lighter in color than the remainder. This is due to the fact that the mechanical action of rubbing has removed part of the substance (starch or size) which combines with the iodine to give the blue or brown color; so that the depth of shade of the rubbed area varies inversely as the degree of rubbing.

If a piece of paper is partially rubbed and wetted, as is done when copying in a letter press, allowed to become quite dry, and then subjected to the action of iodine vapor, the same phenomenon still occurs, but in this case the differences are not as sharp and clear cut as before. And if the paper thus treated is wetted and then dried, the rubbed portions will show up lighter than the others.

is thus seen that whether portions he paper have been wetted or bed the behavior with iodine is ut the same.

n certain cases iodine will indicate nature of the substance which was d for rubbing: the use of bread nbs or of an india rubber eraser es a yellow or brownish yellow r with iodine, and with the former streaks are of a deeper hue and the er sometimes assumes a violet tinge ch is always more uniform than n an ordinary rubber.

These phenomena are due to the fact the fibers are disturbed and turned by the rubbing, thereby exposing a er surface to the action of the ne. Consequently more iodine is d on or absorbed by the rubbed n by the unrubbed portions.

Chemical Hydration in the U. S.

During the war, the firm of Meigs, sett & Slaughter, of Philadelphia, successful in applying chemical hy- tion to the reduction of cotton lint- complete details being given in cKay's paper already referred to. its means slow or slimy stock is duced much more quickly than erwise, the time of beating being atly reduced. According to an ar- e in the *Papierfabrikant* by Prof. Schwalbe of Eberswalde, which is ewed in a recent issue of the *rld's Paper Trade Review,* satisfac- results in the quick production of rated pulp are obtained by treating a pulp with nitrous acid followed a washing with alkali. The addi- of portions of a slimy pulp, made his way, to other stock in the beater elerates the beating process, operat- to swell the other fibers, as "a e leaven leaveneth the whole lump."

German Work on the Subject

Professor Schwalbe is the author of umber of papers on the swelling and ting degrees of pulps and what he to say on this subject should carry siderable weight. In 1914-15 he occasion to study particularly the blem of the quick production of asy beaten stuff and the results ob- ed have already been published by self and Dr. Becker. Since then he experiments made in several mills the manufacturing scale and the ar- e of which the following is a trans- on by J. Melrose Arnot, contains a ement of the results so far obtained.

The study was originally pro- ed at the beginning of the war Ebart Brothers, of Spechthousen, ing the professor to supply a e process for the destruction of k notes, destruction by fire having ved unsatisfactory, as loose notes e carried up the chimney or partly burned notes fell by other means into dishonest hands. Having in mind the destruction of cellulose in the process known as carbonizing mixed or union goods in the textile industry to obtain the wool fiber, he proposed this method, and it proved quite successful, large quantities being destroyed in the carbonizing drums with gaseous hydrochloric acid or with chlorine. The tendered material escaped through the small holes in the drum as it revolved and was conveyed away to the waste tip.

War-Scarcity of Paper

This process had later to be given up as the growing scarcity of fibrous materials made it necessary to repulp the notes and everything else in the shape of waste paper. Attempts were, however, made to use the material from the carbonizers as a sort of filling for paper and quite good boards were made from it, with the addition of a small proportion of sulphite pulp. While beating this mixture it was observed how easily wet and greasy feeling stuff was produced. Professor Schwalbe had already noted the same thing when dealing with sulphite pulp which he had tendered with acid for the preparation of a foodstuff for cattle.

Woodpulp as Cattle Fodder

To feed ordinary long fibered pulp directly to cattle would probably give rise to the formation of indigestible aggregations in the stomach; to reduce the fiber by beating would consume too much power; and it was, therefore, decided to try the chemical reduction process as used in the textile industry and for the destruction of the bank notes. The results were eminently satisfactory, but sulphite pulp had already become too dear and it became necessary to treat the raw wood and straw for this purpose. This is a short digression, but it is of interest and could not hitherto be published owing to the prohibition of the War Committee for Food Substitutes.

For foodstuffs, however, a greater degree of fineness was demanded and it was sought to attain this by the use of kollergangs and of beaters. Again the rapidity with which the slimy stuff was prepared from straw and cellulose was remarked. Raw wood was variable in character and did not give this result so markedly.

Results of Adding Slimy Stuff to Beater

This observation induced the professor to try adding the slimy stuff to the ordinary beater furnish with a view to obtaining an exceedingly dense paper. He actually found that hand-made sheets were exceedingly dense and strong and became transparent when calendered.

Effect of Acids

The treatment of cellulose with hydrochloric acid results in hydrolytic changes, through cellulose dextrin and hydrocellulose to grape sugar and glucose. Many factors play a part in the final result; the concentration of the acid, temperature, time and the nature of the fibrous material. But not every tendering or every hydrocellulose formation gives rise to the slime-forming stuff.

On a former occasion, when preparing wood cellulose for the manufacture of explosives, Professor Schwalbe had found that if soda pulp was treated with nitrous acid and then washed with alkali, under certain conditions a material was obtained which, after a very short beating in the hollander, yielded an almost structureless paper. Both oxidation and acid treatment are capable of producing the condition necessary for the formation of slime by beating and Schwalbe and Becker have already published a number of papers on the subject.

If a blunt point, for instance, the drawn-out and rounded end of a glass rod, is used to write on paper, on exposing the paper to the action of iodine vapors the writing soon appears in brown on a yellowish background, turning blue on wetting. This phenomenon can still be observed even after the paper has been calendered. Provided the paper is not wetted, the writing can be made to appear and disappear by alternate treatments with iodine vapor and with sulphur dioxide gas.

This method is far superior to the use of water for sympathetic writing. The marks made with the glass point are practically unnoticeable, especially if they are made between the lines of ordinary writing in ink. And the reaction is so delicate that it can be reproduced quite readily on a piece of paper which was placed under the one on which the writing was actually done. By prolonging a little while the action of the iodine, the writing will show up clearly, even when the most careful visual examination reveals absolutely nothing. The delicacy of the reaction is still further increased by placing the paper (or superposed sheets of paper) on a hard surface such as marble, glass or porcelain.

The explanation of this phenomenon is to be found in the fact that by the action of the glass rod the sizing substance is compacted along the lines of the writing. Consequently, as there is more material along these lines more iodine is absorbed and the shade is deeper. If the under side of the paper is exposed to the action of the iodine, the writing shows up also; but naturally it is reversed.

This last-mentioned fact naturally suggests the possibility of using iodine to detect pencil writing, as it will have compacted the sizing material in the same way, though possibly not to the same extent, as the glass rod.

When pencil writing is rubbed out with sufficient care not to destroy the surface of the paper, on exposing the latter to the action of iodine the writing sometimes appears. If the paper is rubbed so hard as to destroy the surface it becomes impossible to make the writing reappear with sufficient clearness to allow of its being read. But in this case, if the reverse side of the paper is exposed to iodine, quite frequently the writing will show up, reversed of course, but sufficiently clear to be read fluently, especially if placed before a mirror to rectify it.

If the pencil writing was originally very heavy, it is sometimes possible to reproduce it in a letter press. To do this, a piece of sized and calendered paper is moistened, as is regularly done in letter copying, placed over the iodine-treated writing to be reproduced, and immediately pressed. It is absolutely essential that the whole operation be carried out very quickly.

Of course the clearness of the results obtained depends largely on the nature of the paper. With a slack-sized, lightly calendered paper it is practically impossible to obtain anything satisfactory. And moreover, the paper can be subjected to various manipulations, which it is superflous to enumerate, which prevent anything from showing up.

Another point of great importanc how long after they have occurred wetting, rubbing, or writing be tected. It has been observed that regular wetting and rubbing could detected three months after they length of time letters which had b written with a blunt point could made to appear. It has also been served that the reaction is sharper more delicate if the paper is first pla for about three to six hours over vessel of water before exposing to iodine vapors. However, though t were quite plainly visible after lapse of time, they were much less tense than a short time after the man ulation had been carried out; and is quite possible not to say probal that they no longer appear after a c tain period, which varies according the intensity of the rubbing or wetti action or the heaviness of the writi

---

Sulfur Black *versus* Carbon Black

Relative Advantages of Two Blacks Are Explained By a Man Who Knows

By LEONARD MANN

IN considering the relative advantages of Sulfur Black and Carbon Black, there is one point that under usual conditions must undoubtedly be conceded to Carbon Black, which is, that Carbon Black produces shades of black paper at a lower cost than any other coloring material. In addition, Carbon Black possesses fastness to light. On the other hand however, there are features connected with the use of Carbon Black that are disagreeable, and frequently entirely offset its advantages.

Black papers produced with Carbon Black will always rub off to a certain extent and smudge any light colored articles with which they come in contact. They furthermore show what is generally known as "shiners," which are little lumps of Carbon Black that have not properly broken up during the beating process. These particles take on a higher finish than the rest of the sheet when the paper passes through the stack or the super calenders. Being only loosely and superficially imbedded in the sheet they break up quite readily during any subsequent handling of the paper and discharge their contents of small particles of Carbon Black, thus contributing further to the soiling of other articles coming in contact with the paper.

In its application, Carbon Black always causes an undesirable amount of dust being raised, no matter how carefully it is added to the beaters, which necessitates an especially careful cleaning up after such a run of black paper. Similar troubles are encountered in the washing-up process preparatory to a succeeding run of a different shade of paper.

Deposits of paper stock, colored with Carbon Black, which lodge in the beaters, stuff chests, and pipes are of a slimy character and extremely difficult to remove. Despite the greatest care exercised in the washing-up, traces of this stuff will be noticeable for some time in a subsequent run and are likely to cause not only great annoyance but also an excessive amount of spoil paper, says *Dyestuffs.*

Sulfur Blacks, although genera slightly more costly to use, poss none of these disadvantages and are the same time equally as fast to lig as Carbon Black.

Sulfur Blacks dissolve easily in bo ing water with about one half the amount of concentrated sodium sulfi and this solution is simply added to t beater. After a short time the oxid tion process is finished and the additi of a small amount of alum will neutr lize any trace of sodium sulfide th might still be present. After that, t stock is united for shading with eith aniline dyes or sizing exactly as for a natural stock. Paper dyed in this w will show none of the disagreeable fe tures of Carbon Black.

The backwater will be perfectly cle even on heavy shades, and the washin up will be accomplished with surprisi ease. Sulfur Black is absolutely fa not only to light, but also to rubbing- and water, and "shiners" are entire eliminated.

Hugh P. Baker

Executive Secretary,

American Paper and Pulp Association

Says:

MY DEAR MR. HUGHES:

Let me congratulate you on the March 6th issue of PAPE This particular number contains a number of articles which should be special interest to paper manufacturers of this country. Furthermo the magazine is mechanically very attractive. The trade press servi the paper industry is doing a splendid piece of work in promoting a protecting the industry.

Very truly yours,

HUGH P. BAKER.

Use of Slime Formers in Beating Pulp

ormation of Slow Stock May be Expedited by Direct Use of Chemicals, but Addition of Slime Formers is Better, According to Professor Schwalbe

T HAS been a matter of common knowledge among paper technologists for several years that the ating process may be expedited or arded by the use of chemicals. A ntribution of some importance to our owledge of the subject was made by fred MacKay in an article on the dration of pulps which was published Paper for December 21, 1921. As pressed by him, hydration of the ck is really a chemical operation, energy spent in operating the beat- engine merely hastening chemical ion, which is true. A piece of pure ton treated with distilled water for ty-eight hours will show an increase copper number and the water will ve a higher pH value, which is uivalent to saying that it will have alkaline reaction. The increase in per number indicates the decompo- on of the cellulose represented by cotton, and the formation of a com- und which will eventually break up o glucose and then dextrin. Since cellulose takes on a molicule of ter to form glucose, we should not, haps speak of the process as one of aking up, but it will serve our pur- se. To go farther, would, as Heuser serves, take us too far afield into culation.

Results of Mill Trials

Backed by the influence of Dr. acht it was possible to carry out a l in the mill at Hohenofen in 1918. da pulp, which had been tendered ac- ding to Schwalbe's patent No. 368,- 2, was beaten by itself and in a short e became very slimy or greasy. is material was then mixed with the al furnish in another beater, and ndmade sheets showed a remarkable nsity. Unfortunately, however, when n over the machine, no improvement uld be found in the paper, but is was ved that the suction boxes had re- ved all the slimy stuff. It was then ught that if the fibers were thor- ghly impregnated with the slime, od results should be got. The im- gnation was carried out in a koller- ng, but still there was no marked ference.

After the war Professor Schwalbe rsued the subject further with a view avoiding the necessity to accomplish desired result in the normal course manufacture. By using additions of nitrous acid in a small kollergang quite satisfactory results were obtained. Trials were then made by Herr Emmel at Merken near Düren, and in the presence of Professor Schwalbe at Muldental in 1921, but the experiences here were similar to those at Hohenofen.

Substances That Interfere with Slime Formation

At Muldental Professor Schwalbe noticed that the stuff rapidly became slimy or greasy; but as the beating process was continued this quality disappeared and the final result was as if no slime former had been used. He attributed this behavior to the material of which the beater was made, viz., iron, knowing how detrimental the presence of a salt is to slime production. [The presence of alum would be sufficient to interrupt the hydration of a pulp, which is a reminder that alum should not be added until the beating process is completed.—Ed.] New trials were therefore made at Weissenborn, where the beaters are tiled and are fitted with bronze bars and plates. Paper made from cotton and from linen showed no improvement; but a sulphite paper, after only one hour beating, showed an excellent result. He next attempted to make the process workable in iron beaters and for this purpose resorted to swelling the fiber instead of converting it to oxy or hydrocellulose, and this enabled him to use acids which do not readily attack iron, such as lactic and carbonic acids. The trials were again made by Herr Emmel at Duren, but good results were followed by bad ones and no certain or constant result could be obtained and Professor Schwalbe could not himself be present.

Special Slime Stuff from Flax Shives

Besides the above mentioned methods for producing slimy stuff, there is the special cooking of pulp for greaseproof papers, wherein some of the incrusting matters are retained; and then there is the fact that many tropical plants yield material which rapidly becomes slimy when beaten, for example, the Musa fiber (plantain or banana) and sugar cane pith. But there is one material of European origin which possesses this quality in an astonishing degree. If the shives from hemp or flax are digested by the sulpite process an extremely short fibered pulp is obtained, and this can be beaten to an almost structureless slime in from fifteen minutes to half an hour. The textile industry produces enormous quantities of shives which are used as fuel at present; but Professor Schwalbe forecasts a time when the papermaker will merely have to add a few kilos of this special slime stuff to the beater in order to make dense and strong papers.

Notwithstanding the disappointment he has met with Professor Schwalbe has faith in the process he has discovered, but he realizes that, as in many other cases, final success must be the result of many experiments, and it is to encourage the prosecution of such experimental work that he is now giving the industry the results he has so far achieved.

* * *

NEW METHOD OF USING SHAVINGS

Dr. Alfred Tingle Claims New Process Will Permit Using "Culls"

MR. ALFRED TINGLE, who was formerly employed as research chemist for a large pulp and paper mill in Canada, has been doing work in the laboratories of the University of Oregon, at Eugene, Oregon and has succeeded in perfecting a process for making paperpulp from wood in which shavings and similar "cull" materials of the ordinary pulp mill may be included to give a satisfactory pulp for making heavy grades of dark paper.

Dr. Tingle is accredited with the statement that the manufacture of paper by this new process can be carried on with a much simpler and less expensive plant than is required for any other kind of pulp.

The process involves a double treatment of the wood. The chips or shavings are first digested under pressure with a solution made from lime and sulphur. The product is then crushed to a fine, soft pulp, in certain very cheap acid, which is itself at present only a waste product from another manufacture. The washed pulp can then be made into a very good grade of paper, which research chemists believe, will compare well with that made from kraft.

The application of this new digestion method of Dr. Tingle is expected to be of great importance to the lumber industry. He thinks that it can be used with northwestern fir and at the same time be cheap enough in operation to use in connection with waste products.

When the new process is applied to high grade spruce chips the product may be considered, for many purposes a competitor with kraft pulp.

The Editorial Page

An Open Letter To President Coolidge

DEAR MR. COOLIDGE:

In the multiplicity of duties that are forced on you as President of the United States it is doubtful if you have ever had an opportunity to consider the paper industry. Possibly you have never looked through the mass of documents presented to you and saw—not the words—but the paper which bore those words.

The industry that makes that paper is ill. It is not sick unto death—for it is a long-suffering and peculiarly stalwart industry. But it is distinctly under the weather.

Among other diseases it has never recovered from the war. It became intoxicated in the hysteria of that time as did all industries. It sobered slightly and then following the war it again tore off the lid, as did all industries, and, speaking cruelly, threw a fit. But the paper industry suffered, Mr. President, for that excess. It took its headache, and the bitter taste in the mouth, the general debility and the full punishment for it all. It paid in full—a terrible toll—and it was contrite. It is unfair that the punishment should last so many years, when other industries are again going their blithesome, prosperous way.

The paper industry, Mr. President, only wants a square deal. It doesn't want an unfair advantage over any other. It doesn't want an unjust advantage over foreign competitors. It merely wants to compete on a level, business basis. This, we do not deem too much to ask, Mr. President.

Other industries have been protected by tariffs, tariffs that insure prosperity for American labor and industry, as is right and proper. No one will object to helping the steel trade, the textile trade or any trade. But the paper industry was not protected by a sufficient tariff. If we were unkind, Mr. President, we might naively intimate that perhaps the legislators of the United States did not want to put a tariff of any consequence on certain papers. Because, Mr. President, most legislators read newspapers and periodicals, and if the publishers had to pay tremendous prices for paper on which to print their imperishable literature, they would not feel kindly disposed towards men who caused an increase in that price. These publishers might even suggest in courteous, impeccable language where the legislators might get off. They might even, if forced into unpleasantness, fulminate at length against the perfidy of legislators who would thus impose a hardship on publishers. Now, few legislators like to read unkind things in publications against them. Some even have a positive dislike for such things. Even with practice it is difficult to acquire a great passion for the lurid welts of published dislike.

This, Mr. President, might be one reason why a protective tariff wall was not built up around the paper industry. Of course, there are other reasons also. That tariff, however, was made pliant. It was left to a great extent up to your judgment. Of course, you depend on the Tariff Commission and other governmental agencies, to sift the chaff from the grain. You are far too busy to give minute attention to everything. A man—even a President—is only human.

Under this flexible tariff law, for the first time, you put into effect on March 8, the elastic provision by ordering increases of 12 cents a bushel in the duty on wheat imports and 26 cents a hundred pounds on wheat flour, advancing these two rates, respectively to 42 cents and $1.04. At the same time the ad valorem rate in mill feeds has been decreased from 15 per cent as fixed by the law, to 7½ per cent. The difference between costs of milling in the two countries amounted to only three-tenths of one cent a hundred pounds. This, of course, puts the wheat situation on a thoroughly sound and prosperous basis in the matter of foreign competition. There can be no objection to this by any just man.

The same situation is apparent in the paper industry. You must know, Mr. President, that Germany and other countries are flooding America with paper and pulp at prices ruinously low for American paper and pulp makers. Germany, be assured, is the worst offender, according to all the facts we are able to gather. The economic situation in that benighted country is one where 5 per cent of the people, namely, the large industrialists, are ruling and ruining the remaining 95 per cent. Wood is bought for little or nothing. Labor is paid little. There are no taxes on the product worth mentioning. Then this paper, made for almost nothing, is sent to America, comes in with little or no tariff, and competes with paper made by mills forced to buy wood at huge prices and pay high prices to labor. Such competition is unfair, unjust, and derogatory to the future of the American paper industry. Moreover with a tariff wall protecting other industries, it is discrimination of the most wicked character. The paper industry should have an equal chance. It does not now have that chance.

Do you realize, Mr. President, that the mere carrying out of some of the provisions of the Versailles treaty will put an immediate stop to this ruinous competition? That treaty calls for the imposition of a tax of 26 per cent on all goods imported from Germany, the money to go towards the payment of reparations. Such a tax is not collected, not ever threatened. Germany laughs in her glee at American stupidity and lack of spirit.

England does not impose the 26 per cent levy. But England tried to collect this levy. According to public prints, she imposed the 26 per cent levy, but it broke down because Germany refused to refund it. But a few weeks ago W. Graham, the Financial Secretary to the Treasury, was able to inform the House that an agreement has been come to with Germany by which the rate of levy is to be reduced to 5 per cent. In order to guarantee that no part of the levy will fall upon British importers, the German Government is to compensate the German exporters and, at the same time, to make it a punishable offence to transfer any of the levy to the British importer. Further, the importers who up to date have had to pay the 26 per cent levy are to be reimbursed by the German Government in gold bonds.

According to the Central News British traders will benefit to the extent of £1,000,000 sterling, as the result of the reduction in the rate of the levy. Upwards of £1,000,000 sterling will come to British traders through the channel of reimbursement, namely, payment in gold marks for deficiencies incurred in regard to the levy prior to the time when the reduction came into force. British traders are said to be well satisfied with this new arrangement. It will not affect the volume of trade or the conditions.

Cannot the United States do likewise? It would mean success instead of failure, fair competition instead of bankrupt competition. It would mean an act of comity to our former Allies in the war. It would mean that Germany would be able to thus pay some of the long sought reparations. And immediately other countries that are now losing money in exports to America because of Germany would likewise be able to sell at a profit.

Thus, it will be seen, Mr. President, that two avenues are open to you to help the paper industry.

One is to raise the present tariff sufficiently to make it impossible for other nations to compete. You have full power to do this.

The other is to speak a word to Congress—if indeed you can get a word in edgewise—and have that turbulent body press the reparations levy to a completion. If 26 per cent is not feasible, then let America at least support England by levying the 5 per cent levy, to which Germany has agreed.

This situation is not a passing, transient one. It is one that has long troubled the business world. The paper industry is not getting a fair deal.

We are not touching, in any way, upon the subject of violations of the Anti-Dumping law. That is another jagged bone of contention.

With hopes,

PAPER

The Magazine of the Paper Industry.

NEW DEVELOPMENTS IN PAPERMAKING

Drying Paper By Electricity

It is reported in the World's Paper Trade Review that a process for drying paper with the aid of electricity will shortly be made public, which process will prove without a doubt that it is cheaper to dry paper with the aid of the electric current than by steam. It is claimed that the paper dried in this manner will be free from all the objections which were formerly found with electrically dried paper and not only that but that the paper will show an increase of from 15 to 25 per cent in strength.

* * *

Coating Paper

An improved process of coating paper was recently patented in which a solution of nitro-cellulose is employed as the coating agent. The nitro-cellulose is dissolved in the alkyl ester of a fatty acid having Canadian balsam and alcohol added to the solution. A bath of water to which is added an adhesive such as starch is prepared and the surface to be coated is submerged in the same. The solution is then poured into the water, when it spreads out in a thin film. The solvents are evaporated by natural or artificial means. The surface is then raised out of the water, picking up the iridescent film with it, and allowed to dry.

In carrying out the process a solution was used comprising nitro-cellulose fifty parts and amyl acetate 1400 parts. This solution was then mixed with five parts of mastic. The solution is separately prepared before mixing.

In picking up the film on the uniform surface, such as paper, it is only necessary to establish contact between the film and the edge of the paper, then lifting without any special precaution, when the film will cling to the paper or other surface and leave the bath quite clean. The cleanliness of working permits great rapidity of operation and the use of unskilled labor.

* * *

Purifying the Cellulose Material

Cellulose material is treated with inorganic or organic acids possessing no oxidizing action, such as sulphuric acid, hydrochloric acid, sulphur dioxide, lactic acid, or oxalic acid, before treatment with alkaline earths or magnesia, as described in the chief patent. (German Patent No. 369,606). In this patent it is pointed out that the acids practically hydrolyze the incrustations on the material and facilitate the action of the alkaline earths.

Washable Writing Paper

Ordinary writing paper is first coated with a varnish and the with a transparent lacquer made from copal gum. Then aft the surface of the paper is covered with magnesia powder, it rubbed smooth.

If it is desired to remove the writing from such paper, the the entire surface is covered with a thin layer of soap. Th soap that is used for this purpose is made by digesting gall nut The soap layer must not be moistened too much. The layer allowed to remain on the surface of the paper for about a minut or two and then it is removed by means of a coarse rag an the paper is washed with a little water. This treatment remove the writing. The paper is wiped off with a wet rag and the rubbed dry. After the surface has again been rubbed smoot with a little magnesia powder, the paper can be used agai This process is patented in German Patent No. 388,100.

* * *

Rotary Pulp Strainers

The rotary pulp strainer which is the subject of a Britis Patent issued to Carl H. Jonnson can perform effective wor without the use of any special stirring or shaking device or othe mechanically driven auxiliary means for accelerating the passag of the pulp from the vat through the mantle of the strainin drum.

In the accompanying figure 1 is the rotary straining drum the mantle of which has in cross section the form of an eigh sided polygon, but which can have a greater or less numbe of sides if desired, and 2 is the vat. To obtain a sucking an pressing action on the mass supplied to the vat by means of th irregular form of the straining drum, longitudinal ribs can b arranged in the bottom and the sides of the vat 2. For effectin movements in the mass longitudinal wings 5 may be provide in the inside of the drum 1. It is also possible to provide th straining drum on the outer side with longitudinal wings fo continually removing coarse material and impurities which ar carried up from the bottom of the vat and delivered over a overflow at one side of the vat. The removal of the coars material and impurities may also be effected by means of a discharge channel 8 with a discharge shutter in the bottom of th vat, which discharge channel can be brought into communicatio with the vat by a double perforated bottom 10.

FORESTRY in the PAPER INDUSTRY

Conducted by J. R. Simmons, Secretary Forester, the New York State Forestry Association

orestry Management Plan Is Submitted in New York

Foresters Respond to Request of Chairman Rabenold of Senate Conservation Committee in Splendid Fashion

PECIFIC proposals for forestry legislation in New York, where the work done by paper companies along forestry es is of notable extent, featured the re- it conference of the New York Section, nerican Society of Foresters, in which paper company foresters form no small portion of the membership.

The special committee of the Section, on proposed New York legislation has w been made public, and is as follows:

'It is important that in any scheme of rking for the Adirondack region the sting data on the status of the land be plified. This means that we must have equate knowledge of both state and pri- e land and with respect to:

'(a) Condition (merchantable, non-mer- antable, barren or water.)

'(b) Quantity of standing timber.

'(c) Amount cut in an average year and bable future cut.

'(d) Present and probable future growth.

'No such data have been brought to- ther since Bulletin 12 was published by Commission in 1915. For the private d nothing has been done since the war nsus, the results of which have also been blished.

'Obviously any working plans must ve reference not only to the tract for ich they are prepared, but must take o account the conditions surrounding tract on both state and private land.

'It is therefore urged that provisions be de for reconnaissance surveys of state d similar to the work which the Forest rvice has done and is doing on the tional Forests and that this be included the budget of proposed expenses."

Another set of suggestions, going into matter in great detail, was submitted S. N. Spring and A. B. Recknagel, of factulty of the Department of Forestry Cornell University, the suggestions having d the approval of the staff of the depart- ent. The suggestions are probably the st complete outline of the requirements forestry legislation yet to be form- ted in New York State, and may well m a basis for legislation in other states ere the paper companies are active ng forestry lines. The statement is as lows:

'1. Senator Rabenold has requested that foresters prepare and submit a draft a proposed forestry law.

'2. A bill cannot be drafted until a for- policy is agreed upon. It is, therefore, sirable to list the points upon which embers have previously been in agree- nt and those which deserve attention now.

'3. Assuming that the Senator's request for a forest policy for the entire state, the oposals given below are considered state-wide in application unless otherwise specified.

"4. *Protection:* The present efficient system in the Adirondacks and Catskills should be extended to the rest of the state by further development of *Fire Districts.*

"5. *State Parks:* Clear cut distinction as between state parks and state forests (preserves). Delimiting those areas now owned by the state within the Adirondacks and Catskills which constitute *parks* in the same sense as the National Parks, to be maintained under similar conditions.

"*Examples:* High mountain slopes, areas along highways, streams, lakes and otherwise directly serving the recreational use.

"6. *State Forests:* Remaining areas of state land in the Adirondacks and Catskills and forest areas purchased elsewhere in the state to be placed under forest management with the definite aim of continuous production of timber crops, excepting that class of land noted under Item 5.

"7. *Economic Survey:* Utilizing all existing state agencies and local organizations to determine the best use of which is for forests under state ownership, under ownership by counties, by towns or privately.

"8. *Subdivision of States: District Foresters.* For the development of fire prevention and other phases of forestry practice it is desirable that the plan for the division of the state into districts each in charge of a District Forester, as previously promulgated by the Conservation Commission, be carried out.

"9. *Assistance to Priavte Owners:*

(a) Extension of protection from fire.

(b) Advice and assistance in forest management.

(c) Free trees from state nurseries.

(d) Modification of existing methods of taxation of woodlands.

"10. *Regional Management Units:* Should be delimited in the state. A management unit is made up of those contiguous forest areas, similar in character and composition, constituting a definite forest region. These forest areas, as a whole, should be managed so as to assure a continuous production of forest crops. A plan of management, called a working plan, should be required for each forest area 500 acres or over in extent within the regional management unit. The first of such units that can now be delimited is the Adirondack forest region lying within the "blue line."

"11. *Administration:* There should be a *Board of Working Plans* consisting of representatives of (a) the Conservation Commission, (b) the timberland owners, and (c) the public whose duty is to make such rules and regulations as shall be necessary for the preparation, approval and execution of working plans within the regional management units. (Details as to the number constituting this Board and similar points are purposely left for consideration at the meeting.)"

* * *

For Taxation Reform

How taxes force the cutting of timber was told graphically by W. T. Alberty, of the Pine Lumber Company, at the recent meeting of the North Carolina Forestry Association, when he gave figures on a 20,000 acre tract which his company wished to hold for continuous timber production. The case is notable as being an exact parallel of a New York paper company's experience with a 10,000 acre tract which this paper company wished to preserve, but which it was forced to schedule for the cutters on account of the tax assessments made against it.

The North Carolina land, bought at $4 per thousand feet, with taxes and interest on taxes now represents an investment of $10 per thousand. Adding carrying charges, the cost is $19.

Increasing taxes have more than absorbed the value due to increased growth, so in order to prevent further loss the company is forced to cut the timber. The premium on forestry is with "reverse English." In other words, a penalty for preservation of the timber is imposed by the present tax system.

* * *

Introduces Pinchot Bill

The so-called Pinchot bill, providing for an excise tax on all timber cut contrary to government requirements, has been introduced by Senator Capper of Kansas, who has previously sponsored other Pinchot forestry proposals. Senator Capper, however, is said to also favor the McNary bill, as a means of immediate action for the protection of the country's forests. The McNary-Clarke bill will be given a hearing in the House Committee on Agriculture, probably about the 16th of March, and there is a good chance of the passage of the bill at this session of Congress, at least in the Upper House.

* * *

May Take Abandoned Land

Pending legislation in New Jersey would allow the state to take over for forestry purposes abandoned land on which taxes have not been paid, the amount involved being about 500,000 acres. Revision of fire laws is proposed in bills pending in Massachusetts and Maryland.

* * *

A Fine Gift

Forestry in the South has, according to an address by V. H. Sonderegger, state forester of Louisiana, in an address to the southern mill workers, given a Louisiana parish permanent paper and pulp plants valued at $2,500,000. This parish sanctioned the dedication of a large tract to forestry, and thereby sacrificed taxes totaling $159,000, but gained a new industry.

AMONG THE FORESTRY ASSOCIATIONS

Summary of Work of Associations Regarding Pulp and Paper

THERE are more than twenty state forestry associations in the United States, in addition to the national association at Washington. Reports on the various annual meetings, which are usually held in the beginning of the year, indicate very encouraging progress in the association movement, a movement based upon the argument that a meeting ground of interests within the states is the logical medium through which to accomplish results in forest legislation, forest fire prevention, continuous forest production and reclamation of waste land areas.

Two facts are of especial interest to the paper and pulp industry in relation to the work of the forestry association for the past year, as reported in the minutes of the annual meetings now in general circulation. The first is that forestry association membership among paper and pulp men and lumbermen is on the increase, resulting in the presentation, throughout the country, of the industrial point of view before representative groups. The second is that forest taxation is recognized as one of the most important problems confronting the forestry movement at the present time.

As a contribution to this state forestry association we find the timberland owner delivering an address or presenting a paper on the results of his private experimental work, and outlining the policies which he believes would result in gradual extention of the forestry principles involved to cover his entire property. Even in Ohio, where, to the outside observer, forestry for watershed protection looms as a more important phase than timber production, we find H. C. Rogers reporting before the annual meeting of the Ohio Forestry Association not only the growing but the harvesting of a succesful 150 acre plantation of trees, with a very satisfactory financial showing.

We have had access to the minutes of the leading state association and find the taxation matter covered in resolutions which are strikingly similar in composition and principle. From these resolutions it is apparent that what the forestry people want, and what the industries want is a tax levied once and once only, on the value of the crop at time of harvest, whether the harvest comes as a clean cutting or as a thinning. The following might be set down as a composite statement based on several resolutions covering the subject by several or our leading forestry associations:

"Next to the protection of the forest from fire comes the just taxation of forests in establishing conditions under which the practice of forestry on privately-owned lands may be carried on with the expectation of a reasonable profit. The Forestry Association has sponsored bills before the Legislature based on the principle of a tax levied on the yield of the forest at time of harvest. We again affirm our belief that in this state and in other states there is need of legislation that shall put this principle into practical operation, and we urge the support of legislative measures designed to accomplish this result."

In a later issue PAPER will outline the taxation measures advocated in several of the states where association activities have resulted in presentation of remedial measures before the legislatures.

* * *

Age is obliged to use caution, and seeks consolation by calling it wisdom.

Want Closer Co-Operation

How to achieve closer co-operation between the Woodlands Section of the American Paper and Pulp Association, and the United States Pulp Producers Association, both of which have O. M. Porter, Assistant Secretary of the American Paper and Pulp Association as their Secretary, will be one of the questions discussed at the meeting of both organizations during Paper Week, beginning April 7.

Both the pulp mills and the foresters of the paper industry have many common problems, and it has been felt by many that a closer coordination of their work might be achieved through their common Secretary, particularly as to pulp wood problems and statistics.

The pulp producers have established operating efficiency reports, as a check on their individual mill operations, but problems of the basic raw material are so interlocked that there is considerable sentiment for a still closer official connection between the two groups. The form which this cooperation will take will be decided by the two organizations during convention week. The Woodlands Section convention on Wednesday, however, will take up many other problems of interest in the problems of forest management, to give the mills an assured supply of the raw material they need for the continued operation of their mills. Features of this will be papers by representatives of the United States Forest Service on Pulpwood Decay and Forest organizations for fire control.

* * *

Adopts Working Plan

The story of an elaborate forestry management development by a paper company is that told in the announcement of plans for operation of the new holdings of the A. P. W. P. Company in Nova Scotia. Preservation of young growth by fire prevention and careful logging will be the policy, and Frederick A. Gaylord will be the forester in charge. He has as an assistant James A. Connors, and no small part of the work of these men will be assistance to the provincial foresters, and aid to wood lot owners adjoining the company's forest lands in proper handling and development of their properties.

* * *

George D. Pratt, New President

As forecasted in this department, Henry S. Graves, president of the American Forestry Association, has resigned. At a meeting of the directors in Washington, George D. Pratt, former conservation commissioner of New York, was elected president. The resignation was presented because of Col. Graves' new duties as provost of Yale University.

* * *

Much Lumber Here

Superintendent of the municipal dock at Vancouver, Clarke County, Washington, made the statement recently that approximately 15,000,000 feet of lumber was cut monthly by the sawmills of Clarke County. Over 2,000,000 feet is each month shipped over the municipal dock. This does not include the amount shipped out by the Columbia River Paper Mills Company which has leased a portion of the municipal dock and ships over its own section of the dock.

* * *

Continental Paper & Bag.

Owen Shepherd, treasurer of the International Paper Company, has been elected treasurer, director and member of finance committee of the Continental Paper & Bag Mills Corporation.

WISCONSIN FOREST MEN MEET

Profitable Meeting of Protective Association at Chicago

A MEETING of the Wisconsin Forest Protective Association was held at the Congress Hotel, Chicago, Wednesday March 12.

In addition to the regular members there were present O. T. Swan, Secretary and Manager of the Hemlock and Hardwood Association and E. E. Hubert, President of the Madison Chapter of the Forestry Association.

Mr. Swan said that he thought his association and the Wisconsin Forest Protective Association had a lot of things in common and that their interests were identical on taxation and fire protection, which both were holding up timber development. He said his Association favored the McNary bill now before the U. S. Senate and thought we should all work together to get the needed results.

Mr. Hubert said his Association had long ago given up the idea of tree planting and were concentrating their efforts on fire protection and taxation as the first great needs.

A committee of three from the Wisconsin Forest Protective Association is to meet with a Committee of three from the Hemlock and Hardwood Association before the April meeting of the Hemlock Association to arrange for consolidation and co-operation of effort of the two Associations. D. C. Everest, B. T. McBain and one more to be appointed by the President are to compose the comittee of the Forest Protective Association.

The following were present at the meeting: O. Bache-Wiig of the Wausau Sulphate Fibre Co., Mosinee; J. H. Delbridge of Marinette & Menominee Paper Company of Marinette; Guy Waldo of Falmbea Paper Co., Park Falls; W. J. Sullivan of Grandfather Falls Company, Merrill; Mr. Baker of Dells Pulp and Paper Co., Eau Claire; Mr. Johnson of Marinette and Menominee Paper Co., Marinette; D. C. Everest, Marathon Paper Mills, Rothschild, and B. T. McBain of the Nekoosa Edwards Paper Company.

* * *

A Long Incline

One of the chief features of the Crown-Willamette Paper Company logging camp at the Bradley logging works at Cathlamet is an incline that is 2600 feet long and a maximum grade of thirty-five per cent. A donkey engine weighing approximately 85,000 pounds is used in letting down the logs on this incline and hauling the men up. The operations are above this incline.

It is expected that there will be timber enough to keep the camp at its present location for more than three years. The camp may then be moved with all its machinery to the timberlands recently purchased by the Crown-Willamette Paper Company in Washington state near the boundary line.

* * *

For Paper Sales

Plotkin Brothers, wholesale paper merchants of Denver, Colorado, advertising in the *Denver Grocer* says: "It's Some Job to call on everybody in our territory, no matter how hard we try. So, if we don't get around, send in your orders or drop us a card about your wants. Our mail order service is quick, sure and economical. You will find it most helpful. Denver Jobbers for Denver Merchants."

* * *

Take Permanent Office

Notice has been sent to those interested in the paper industry in America that George Buchanan & Company, of London, dealers in woodpulp, are not located permanently at the Blackfriars House, New Bridge Street, London, E. C. 4.

Through the Middle West

McBAIN TAKES TRIP TO PACIFIC COAST

Writer for Paper Makes Swing Around the Circle and Visits Many Points

B. T. McBAIN, Assistant General Manager of the Neekoosa Edwards Paper Company of Port Edwards, Wisconsin, has just returned from a three weeks visit to the Pacific Coast, where he visited many of the mills and his old haunts. It will be remembered that prior to Mr. McBain's coming to Wisconsin some three years ago he was connected with the Pacific Coast mills, having been in the paper game for 30 years, 27 of which were on the Coast.

Among those mills he praised the highest was the new mills of the Washington Pulp and Paper Company at Port Angeles, Washington. This city is reached by boat from Seattle to Port Townsend and thence by rail requiring about 4 hours time. These mills are the most economically arranged and manned on the Pacific Coast.

Before returning to Port Edwards, however, he visited many Pacific Coast cities and reports business good in all parts. He says that as usual there are paper mills being built in almost every district on the Pacific Coast, but that the only new one actually building is at Vancouver, Washington, where the Columbia River Paper and Pulp Company is about ready to widen their building so that they can start setting up their machine. It is reported that J. C. Pollanz will be the sulphite superintendent, and Fred Fuller, of Watertown, New York, the paper mill superintendent.

The New Hawley mills of the Hawley Pulp and Paper Company replacing those that burned down on October 7th, 1923, are being built of reinforced concrete throughout, are also about ready for setting up the machine and they should be making paper not later than May first, or just a little short of six months after their destruction.

The new concrete building replacing the wooden frame structures in the West Linn Mills of the Crown Willamette Paper Company are nearing completion and when the present building program is complete that mile of the Willamette River will be built of concrete and steel.

The Portland Pulp and Paper Company with Joseph Kaster general manager, report going ahead with building of a kraft pulp mill and the installation of a paper machine within the city limits of Portland. It was reported that A. C. Witherbee, now Superintendent of the Peshtigo Pulp and Paper Company of Peshtigo, Wisconsin, will be the superintendent of this new paper mill.

* * *

Taking Lime Sludge

Hundreds of farmers living near Mosinee, Wis., are taking advantage of the offer of the Wausau Sulphate Fibre Co., to supply them with lime sludge required to neutralize the acidity of soils, according to J. C. Justesen, traffic manager for the company. About 10,000 tons of lime sludge has been stored by the company during the winter and will be available early in the spring.

Last year the company shipped about 50 carloads of sludge to nearby towns and hundreds of farmers hauled away the by-product with trucks and wagons. The company is charging $10 a carload to cover the cost of handling and loading. County farm agents are urging farmers to secure the sludge to fertilize their soils.

ROSEBUSH BOUGHT OUT EIGHT STOCKHOLDERS

Water Power to Be Developed by Northern Paper Mills

MR. and MRS. JUDSON G. ROSEBUSH of Appleton who acquired sole ownership of the Outagamie Paper Co., and Hewitt Water Power Co., Ltd., at Kaukauna, Wis., purchased the interests of the eight other stockholders, the largest of whom was A. W. Priest, president of the company. No announcement has been made of plans to develop the property.

The paper company and the water power company was organized almost four decades ago by the Patten and Priest interests. In late years Mr. Rosebush, representing the Patten interests, acquired the interests of some of the stockholders and last week he purchased the holdings of the remainder.

The Northern Paper Mills, Green Bay, of which Mr. Rosebush is general manager and treasurer, has acquired the waterpower and property formerly owned by the White Rapids Paper Co. on the Menominee River but has no plans for immediate development. It is planned to erect a hydro-electric plant at the waterpower and transmit the power to Green Bay. The waterpower can generate about 10,000 horsepower, it is said. A survey of the property is being made and estimates of the cost of development will be prepared soon.

* * *

MAKING OVER MILLION NAPKINS A DAY

New Napkin Folding Machine Makes Production Possible

THE Green Bay Paper Napkin Company has reached a production of about 1,200,000 napkins a day. This output is made possible by aid of a new napkin folding machine recently patented by P. J. Christman and James Deloye, two officials of the company. The patent has been assigned to the Green Bay Paper Converting Machine Company which is operated in the same plant.

The new machine has some features not possessed by others, it is said. As it is being operated it is turning out 400 folded napkins a minute and counting them. The operation is simple enough. Two pairs of rollers, one almost directly above the other, accomplish the folding. The paper enters from a roll the width of a napkin across a triangular piece and the first fold is made as the paper comes off the triangle into the first pair of rolls. A vacuum in one of the top rollers catches the end of the folded paper and draws it around until the point of the second fold is directly over the lower rollers when a second vacuum on the lower rollers draws the paper between them for the second fold.

Once below the second pair of rollers the napkin, now in the quarter fold, is placed in bunches of 250 and the number marked by a raised napkin.

The machine is driven and the vacuums created by an electric motor on the machine. It is steel with ball bearing construction to make it easy for operation, and packs the napkins in regular bunches ready for shipping. Another folding machine is in operation at the same plant, but has not the same speed. All of the movements of the new folder are rotary, making great speed possible.

ST. LOUIS DOES BIG PAPER BUSINESS

Use of Paper Greatly Increased During Past Year

FIGURES just completed by the St. Louis Chamber of Commerce show that the total volume of business done during 1923 in the paper, stationery and envelope industry in St. Louis totaled $27,750,000. In the same lines a total of $25,000,000 business was transacted in 1922. The printing trade was spotty during the year and the total business for 1923 was $6,000,000. Figures for the year previous are not available but all firms report an increase during 1923.

The tonnage of printing papers sold in St. Louis during 1923 showed an increase of from 10 to 50 per cent according to the grade or quality of stocks. The finer grades are always among the leaders in the local demand since St. Louis consumes vast quantities of the better papers in direct by mail advertising.

Since the first of the year the market on both old and new rags for papermaking has been unusually firm with a tendency to rise. The high price of cotton and the substitution for shredding and breaking up by cotton waste mills, instead of low grade cotton formerly used is held responsible for the increase in rag prices.

Rag prices are now from 15 to 80 per cent higher, depending upon the grade, than at this time during 1923. Indications are that they will go higher. However, writing, ledger and book mills are at present selling freely giving all concerned bright assurances for the future.

One expression of interest in the St. Louis territory comes from Ley P. Rexford, president and general manager of the American Paper Products Company. Calling attention to the fact that general business is good he adds his opinion that it would require but little effort to start an industrial boom. "The paper industry is generally good and we are looking forward to a big business in 1924," says Mr. Rexford. "The most essential thing for a greater volume of business is for the government to reduce taxes and stop nagging the railroads. I feel that one of the greatest errors of our government today is that it has throttled business to the point where it can tell it what not to do but there has been no constructive legislation to tell us what to do. The result is that business, in trying to find its way out, has done things that, legally, has caused trouble."

* * *

Continental Site Doubtful

Whether the $200,000 plans which the Continental Bag and Paper Co. is considering erecting in the west will be built at Menominee, Mich., or Oconto Falls, Wis., has not been determined, it was stated at a recent meeting of the common council of Menominee when a report was made on a proposal to the paper company that it purchase land for straightening out a city street and receive in exchange a parcel of land now used by the street. It was suggested that the parcel that was to be given to the paper company be added to its present property.

The company, however, according to the report, balks at buying the required land and it was said it would build the new plant at Oconto Falls rather than buy the property. No action has been taken by the council and further negotiations will be made with the paper company.

PAPER MAN ON LONG AUTO TRIP

Willard P. Hawley, Jr., Off on Trip to Mexico City by Automobile

WILLARD P. HAWLEY, Jr., vice president and general manager of the Hawley Pulp & Paper Company of Oregon City, Oregon left Portland March 8, 1924, with two elaborately outfitted automobiles for an overland trip to Mexico City and return which he expects to require approximately two months time.

Not including the cars the most important parts of the Hawley expedition equipment were manufactured in Oregon.

There will be long stretches of desert waste through which no automobile has previously travelled successfully and then there is the danger of meeting hostile rebel bands but Mr. Hawley is optimistic about the success of his journey. The party goes by way of San Francisco, Los Angeles, El Paso, San Antonio, through Chihuahua, Torrean, Aguas Calientes, Guanajuto, Queretro to Mexico City.

Accompanying Mr. Hawley on this automobile trip to Mexico City are Earl C. Brownlee, a newspaper man, Bud Stright, chief electrician for the Hawley Pulp and Paper Company and H. H. Brownell, a motion picture camera man.

They carry letters to President Obregon of Mexico from Secretary of State Hughes, various senators, Governor Pierce of Oregon, and city officials of Portland, Oregon.

* * *

Envelope Company Held Up

At 4:30 in the afternoon two men walked into the office of the Rocky Mountain Envelope Company, 730 Acoma street, Denver, Colorado, when Miss Laura C. Frances, the cashier, walked forward to greet them, the leader said: "We want the pay roll."

The second man was really a prominent doctor whom the bandit had forced under penalty of death to accompany him after stealing the doctors automobile.

Four hundred and sixty dollars was obtained, the bandits then smashing the doctor's car and giving him the laugh.

* * *

ANALOMINK PAPER MILL HAS NEW MANAGER

Leonard Mann Succeeds Eskridge Who Goes to Mohawk

IT was announced by officials of the Analomink Paper Mill Company that Leonard Mann, lately connected with the National Aniline and Chemical Company of New York City, had succeeded J. L. Eskridge as general manager of the paper mill at North Water Gap, Pa. Mr. Mann has taken active control of the management of the plant.

Mr. Mann has been in the paper manufacturing business all his life. He grew up in a paper mill, and has been at it ever since.

He is an expert chemist as applied to paper manufacturing and is recognized in this capacity not only in the United States, but in foreign countries as well. Mr. Mann has traveled to a large extent, and has been affiliated with paper manufacturing plants in various parts of the world. He is a specialist in manufacturing colored papers.

The new manager of the Analomink paper mills was formerly connected with such paper manufacturies as the American Paper Company at Holyoke, Mass.; the Hammermill Paper Company, at Erie, Pa., and numerous other factories of like standing.

It was announced J. L. Eskridge, who has been the general manager of the Analomink paper mill, had accepted a position with the Mohawk Paper Company, which has factories at Cohoes and Waterford, N. Y.

Caught in The News

At Elizabeth, La., a paper mill is being erected. When completed it will produce twenty tons of pulp daily. No names are given.

* * *

A chemical engineer has developed a method of making paper from yellow pine stumps, first extracting the turpentine and rosin. Neither name or location given.

* * *

At Stockholm, Sweden, an engineer using waste paper, clay and sulphate lye, has been able to turn out a fireproof product which is durable for building material. The combination may be painted, stained and polished, or the old time wall-paper may be hung. Name not given.

* * *

Was a Paper Man

Samuel M. Stow, who recently died in Manila, was at one time assistant superintendent in the Crown-Willamette Paper Company plant at West Linn, Oregon. While there, at the risk of his own life, he saved a man from drowning in the locks for which he was awarded a Carnegie medal for heroism. His widow and one son survive him.

* * *

NEWSPAPERS BREAK OUTPUT RECORD

American Periodicals Used 2,800,000 *Tons of Paper Last Year*

THE year 1923 set a new high record for the consumption of newsprint paper in the United States, exceeding the year 1920 by about 28 per cent and the year 1922 by about 15 per cent. Total net consumption amounted to approximately 2,800,000 tons, of which mills in the United States produced 1,506,204 tons. This production was practically all consumed in the United States, our export shipments during the year being only approximately 16,360 tons.

To make up the balance we imported 1,108,390 tons from Canada, representing approximately 80 per cent of the total Canadian production, as well as 200,450 tons from the European mills. The imports also establish a new high record, the purchases from each of the foreign countries exceeding any previous year by very substantial margins.

United States production for 1923 was about 1.8 per cent less than that for 1920 and only about 2.55 per cent above that for 1922. On the other hand, however, Canadian production has continued to increase and the total production for the two countries for the year 1923, amounting to 2,748,000 tons, exceeded the previous high record set in 1922 by 218,000 tons, or approximately 9 per cent. The Canadian industry has shown rapid strides within the last few years due to the addition of new equipment, whereas production in the United States has shown only little variation with practically no tendency toward expansion in the way of new equipment.

* * *

Making Paper From Straw

Considerable interest is being aroused in Manitoba over the possibility of manufacturing pulp suitable for the manufacture of high-grade white paper from wheat and oat straw. Recently about 200 bales of straw were shipped to Grenoble, France, where it is proposed to have the straw manufactured into pulp by the De Vains process. If results are satisfactory, it is said that the De Vains Company contemplates the erection of mills in the vicinity of Winnipeg with a capacity of 50 to 100 tons of pulp daily.

PAPER EXPORTS IN JANUARY COMPILED

Less Than in December But Larger Than in January, 1923

PAPER exports from the United States during the month of January, 1924, were valued at $2,051,584, according to figures of the Paper Division of the Department of Commerce, a loss of $134,623 compared with the previous month, but a gain of $90,043 compared with January, 1923. While the loss as compared with December, was fairly well distributed, the majority of the various classes showing a decrease in value were: Book paper, $54,743; wrapping paper, other than kraft $51,412; tissue and crepe paper, $12,310; toilet paper $13,096; carbon paper, $11,947; paper board and strawboard $17,603; and wall board, $20,636. Playing cards, exports of which increased enormously during 1923, also fell off to the extent of $15,073 last month. These losses were compensated to a great extent by an increase of $50,116 in exports of photographic paper and $21,858 in exports of surface-coated paper. Other classes which showed an upward tendency during January were: Newsprint, greaseproof and waterproof paper, hanging paper, towels and napkins, paper bags, and boxes and cartons.

If the comparison is made with January, 1923, a much better result is shown, exports of the various classes, with a few important exceptions, showing substantial increases, varying from approximately $10,708 in the case of carbon paper to $65,314 for newsprint and $86,737 for paper and strawboard. On the other hand important losses took place in exports of book paper, wrapping paper, toilet paper, and playing cards.

The value of paper and pulp exports from Canada during January, 1924, was $10,900,050, a decrease of $774,136 under the December exports, but $601,807 in excess of those for January, 1923, Consul General Albert Halstead, Montreal, reports. Newsprint accounted for 65 per cent of the January, 1924, shipments, exports of this product amounting to 93,708 tons, valued at $7,089,061, an increase of 10,919 tons in weight and $954,234 in value over the previous January. All of January's newsprint shipments, except 561 tons which went to New Zealand and British South Africa, was sent to the United States.

* * *

To Talk Imports

Import problems will feature the forenoon program of the Salesmen's Association convention on Tuesday, April 8, of the annual Paper Week, while a dinner and smoker with addresses in a lighter vein will take the place of the dinner-dance held the last few years by the paper salesmen of the country.

Plans are already under way for the Salesmen's meeting, and Henry A. Wise has been invited by President J. L. Fearing to speak on the import situation at the forenoon business session of the Association. No other subjects, except matters relating to the year's work will be discussed at the forenoon session, and adjournment will be taken before luncheon until the evening affair.

Some nationally known humorist will be one of the speakers at the evening meeting, and Edward A. Guest was invited, but declined owing to a previous engagement in the West. The speaker will be some man, however, with a message of equal interest to the salesmen.

F. N. Countiss, chairman of the convention committee, has already secured some entertainment features for the smoker which will follow the dinner, and the entire affair will be of the most informal type.

SAYS CANADA SHOULD BARGAIN FOR THE UNITED STATES MARKET

Financial Post, of Toronto, Reviews the Situation—Says Canada Talked Embargo Years Ago

THAT the Canadian public is coming around gradually to a compromise arrangement on the pulpwood export question is evident from the following, which appeared in a recent issue of the *Financial Post* of Toronto under the heading: "Canada should bargain for U. S. Paper Market."

"Twenty years ago one of the livest questions of the day was an embargo on pulpwood. Today Canada is still discussing the same question."

"When the question first came up, Canada was half way in prohibiting the export of pulpwood. The four big pulpwood provinces put embargoes on the export of wood from crown lands, and as a result the United States was forced, by the pressure of the big publishing interests, to give free entry of Canadian newsprint into that country. From that time dates the tremendous expansion of the Canadian newsprint business, now Canada's biggest exporting industry. To speak of the expansion and prosperity of the Canadian pulp and paper industry is really misleading. The newsprint industry in Canada is prosperous but the pulp mills are far from prosperous and the high-grade paper and wrapping paper mills are not rolling in wealth by any means."

"Canada only went half way with its provincial embargoes. This country still permitted American capitalists to buy vast stretches of forest lands and to strip them bare of their trees to fill the maw of grinding machines located across the line. Section after section of the country was denuded by interests that have little or no desire to perpetuate the forests of the country, but who slashed and hacked at our greatest natural resource and paid us a few dollars in lumber jack's wages, a few dollars in freight charges and a few dollars for the land. Export of raw wood from freehold lands has never been prohibited from Canada. For that matter, export of wood from crown lands has never been entirely prohibited, for through the system of special licenses and by lax checking up of the source of wood shipments labeled as from freehold lands, there has always been a large amount of crown lands wood shipped from Canada raw and unfinished."

"Altogether apart from the fact that this action has drained our forest resources without giving us adequate return, it has been grossly unfair to Canadian pulp and paper makers outside of the newsprint field. Consider the position of a firm making wrapping paper in Canada. This company cuts down the trees and converts them into kraft pulp and ground woodpulp. If it wants to sell this semi-finished product across the line, it may ship it into the United States duty free and get anywhere from $25 to $65 a ton for it. It probably will not make money out of it. There is hardly a company in Canada today making pulp only that is prosperous, for the pulp meets with terrible competition from European pulps and the price ultimately received is apt to be less than the cost of production. How true it is can be seen from a survey of the number of large Canadian pulp companies that are now in bankruptcy.

"But if this Canadian company manufactures this pulp into paper in order to get $150 or more for it, the door into the United States market is closed. There is a tariff wall so high that it prohibits sales of Canadian wrapping paper or Canadian high-grade paper in the United States."

"The Canadian company cannot sell its paper in the United States, but an American manufacturer can cut wood alongside the Canadian company's timber limits, ship the wood into the United States, make it into paper and sell it at home.

"If Canada is going to continue to sell pulpwood to the American manufacturers, Canada ought to get in return free entry of all Canadian wood products into the United States.

"Canada wants the embargo on pulpwood, but it would be willing to give up the embargo for something just as good. There exists today an opportunity to build up one of the greatest of Canadian industries. Let the government at Ottawa bargain with the United States on the pulpwood embargo. Canada is in a strategic position to strike good terms.

"Free wood for the United States and a free market for Canadian paper in the United States would result in numerous paper mills springing up around our bankrupt pulp plants. There would be hundreds of new jobs created for Canadian workmen; thousands of tons of new freight for Canadian railroads; dividends for investors who are now in danger of losing much of their investment.

"Canada ought at least to give itself an even chance to make money out of its forest. Free entry for our papers into the United States is worth striving for."

* * *

Forecast More Consumption

Increased consumption of newsprint in 1923 and prospects that 1924 would see the present high rate sustained makes it probable that the International Paper Company will soon take steps to increase the capacity of its newsprint plant at Three Rivers, Que. The Canadian mill has a present daily capacity of almost 320 tons of newsprint which could be increased to 500 tons daily with small outlay. Plans are reported to be under consideration by the company for transformation of three paper mills in the Watertown, N. Y., district into hydro-electric units. With power plants already developed by International Paper in the past two years, and those in process of construction, new developments, when effected, would make the largest producer of paper in the world an important figure in the public utility field.

* * *

Talks Safety First

A. P. Costigane, Toronto, secretary-engineer of the Ontario Pulp and Paper Makers' Safety Association, spent some days last week visiting certain of the pulp and paper mills in the Niagara Peninsula, where he discussed with the managers the salient features in connection with the analysis of accidents which had taken place during 1923. "An analysis of 1923 accident reports," said Mr. Costigane, "shows clearly that the large majority of accidents can be traced to one of several causes which include handling of material, slipping or tripping, trucking, block pile, etc." Mr. Costigane is of the opinion that concentration on the elimination of the cause of accidents which are responsible for so many repeats would go far to improve the record and is hopeful that something along this line will be done during the current year.

* * *

Two Important Bills

Government legislation of importance to lumbering and pulp manufacturing companies entered the Ontario Legislature in Toronto last week and secured its first reading. It was constituted into two bills, one of which placed an embargo on the export of hardwood, while the other provided for the licensing of pulp and saw mills, its aim being to check up the returns to the Government by operators, to prevent disputes over rights in rivers during driving operations, and to secure information for statistical purposes. The licensing bill, in addition to providing a nominal fee, has enabling sections as follows: to secure information regarding the amount of timber and pulpwood cut, whether from private or Crown lands; to secure information regarding the amount of pulp and paper made by each mill; to control the erection of saw mills so as to regulate the fire hazards; to avoid disputes between two or more operators through booming or driving operations; to enable the Crown to check up against operators' returns when deemed necessary to protect itself against spurious operations.

* * *

Talks on Newsprint

"The Manufacture of Newsprint" was the subject of an address delivered before the Riverdale Kiwanis Club, Toronto, last week by W. A. Peacey, of the *Toronto Mail and Empire.* In his address Mr. Peacey outlined the wonderful process of transforming pulpwood into paper, and demonstrated by the aid of samples supplied by the J. R. Booth Company, of Ottawa, the newsprint in the various stages of its manufacture from the log of wood to the roll of paper ready for the printing presses.

* * *

Southworth Dies

The death took place in Ottawa a few days ago of Thomas Southworth, who was director of forestry and director of colonization in the Ontario Government from 1895 to 1907. The remains were taken to Toronto for burial. The late Mr. Southworth was at one time editor and proprietor of the *Evening Record* of Brockville, Ont., and was one of the incorporators of the Canadian Forestry Association. He was vice-president and managing director of the Deloro Mining and Reduction Company and a director in the National Equipment and other large companies in Canada.

* * *

Observing 40th Birthday

At the annual meeting of the American Sales Book Company, Limited, held at the head office in Toronto last week, A. M. Bovier, the general manager, referred to several new lines of product which had been brought out during the past year. These, he said, were now being nationally advertised in connection with the fortieth anniversary of the founding of the business. S. J. Moore, of Toronto, the president, gave some reminiscences of the days which have intervened since the first shipment was made from the company's initial factory was established in January, 1884. Mr. Moore stated that the business of the company was ahead of that of last year and that prospects were exceptional. Prior to the annual meeting the directors of the company entertained Mr. Moore and some of his associates to luncheon at the National Club when brief addresses were given by Dr. Charles W. Colby of New York and Lewis Henry of Elmira, N. Y. During the proceedings Mr. Moore was presented with an oil painting of himself painted by E. Wyly Grier, the noted Canadian artist.

* * *

Charles W. Price Dies

One of the most popular men in the Toronto paper trade passed away last week in that city in the person of Charles W. Price, city traveler for the Allan Paper Company, Simcoe Street. The late Mr. Price died after a few days' illness of pneumonia. Before coming to Canada he was for some years with the John Dickinson Paper Company of London, Eng., and worked for them in London and in South Africa. When the company opened an office in Montreal he was in charge there and when it was closed and taken over by the Allan Paper Company he came to Toronto with the latter firm. He was widely known and highly respected in the Ontario paper trade generally.

ABITIBI REPORT IS A GOOD ONE

Annual Statement Shows a Balance of Over Two Million

THE annual statement of the Abitibi Power and Paper Company, Limited, for 1923, shows a balance of $2,396,769 after all charges including preferred dividends have been met. This is applicable to the common stockholders of the company, and is equal to about $9.50 per share on the 250,000 shares of stock of no par value outstanding. This compares with $1,812,323, or $7.24 a share for 1922. Receipts, from the sale of paper were $11,047,667, as against $9,461,289 in 1922. Operating general and administration expenses were $6,768,088 as against $5,846,462, the net earnings being $4,279,579 as compared with $3,614,837 in 1922. Of the deduction of depreciation charges and preferred and common dividends the balance is $1,396,769, which added to the previous balance of $4,807,238 brings the total profit and loss balance to $6,204,007.

* * *

More Evidence

Reports to the effect that the International Paper Company is converting mills at Watertown, N. Y., into plants for the production of hydro-electric power, accompanied as these reports are by others that extensions are contemplated to the company's mills at Three Rivers, Que., is considered by the Canadian trade as further evidence of the transfer of the newsprint industry to Canada. The Three Rivers mill has a present capacity of 320 tons a day, and it is understood that this might be increased to 500 tons at very little extra capital outlay. This is additionally interesting because of the fact that the Three Rivers plant is included in the scheme for the merging of newsprint interests in the St. Maurice Valley.

* * *

Tells of Low Price

Mr. Andrews, Jr., son of W. C. Andrews, with whom he is associated in the business of importing pulp in London, was in Toronto and Montreal last week. Mr. Andrews is on a business trip to Canada and the United States. He explains that the low prices of Scandinavian pulp as a matter of low cost of production and of German pulp as low production cost, very much depreciated exchange, and the necessity of turning raw material into cash. He does not see any immediate likelihood of increases in European prices for pulp. He said that Finnish goods are coming into the British market, but are not a really important factor. Mr. Andrews stated particularly that many British houses prefer the Canadian to the European way of doing business.

* * *

New Company Busy

The waste paper business in Ottawa, formerly carried on by A. L. Florence & Son, has been taken over by a new company which has been incorporated under the name of The Capital Paper Stock Company, Limited. The new organization will be controlled by E. Pullin, Toronto, president, Harry Pullin, vice-president and A. T. Brown, secretary-treasurer.

* * *

Protest at Embargo

Settlers and organizations representing rural interests continue to protest against the proposed embargo of exports of pulpwood from Canada. Before the Canadian Pulp Wood Commission sitting at Kootenay, B. C., several witnesses appeared and represented that such an embargo would mean much hardship to those connected with the lumber industry. The view was expressed that while the ultimate effect of an embargo might be to cause the building of more paper mills in Canada, still during the interval much hardship would result.

Reviews Box Lines

Shareholders of the F. N. Burt Company, Limited, attended the annual meeting in Toronto last week at which statements were presented by the president, S. J. Moore, who reviewed the operations in paper box and other lines of the company during the year. Miss M. R. Cass, general manager, who is at the head of the United States end of the business, also spoke, and gave some interesting facts about the affairs of the organization. During the year expenditures, well in excess of $100,000 were made in developing new lines which would have a wide distribution. A line of paper drinking cups has been developed which will have an extensive market. A process has also been evolved of moulding paper which is likely to have a wide market. These latter products consist of novelties and toys which will be stocked by chain stores throughout the continent. All the old directors and officers were re-elected.

* * *

Death of Fremont Spicer

Fremont Spicer, who built the Frontenac paper mill at Brownville, N. Y., years ago, and who was one of the editors of the *Fourth Estate,* a newspaper man's publication, died recently at his home in Kew Gardens, Long Island, after an attack of pneumonia. Mr. Spicer was well known and greatly liked by many of the older generation of papermakers.

* * *

Chemists to Have Experience Meeting

Prof. Ralph H. McKee, of Columbia University, will preside at a meeting of the American Section of the Society of Chemical Industry, to be held at the Chemists' Club, New York, on Friday evening, March 21. It is to be "An Old-time Experience Meeting" and the announcement sets forth that "Brother McKee will open the exercises, after which we will hear from the following Brethren: Elwood Hendrick, P. I. Murrill, Edw. Sakal, A. W. Hixson, D. D. Jackson, H. T. Beans, W. H. Gesell, C. M. Salls, H. B. Faber, W. H. Eddy, Jerome Alexander and D. E. Cable."

Subjects of papermaking interest will be discussed in addition to more purely chemical topics. William H. Gesell, formerly general manager and superintendent of the Hamersley Manufacturing Company, will discuss the deleterious effects of iron bacteria as affecting the color of white paper, and other paper technologists will contribute to the program of the evening.

* * *

Are Against Embargo

At the annual meeting of the Hull, Quebec, County Council held recently, a motion was adopted protesting against the proposed embargo on exports of pulpwood. Mayor Legauly of Maniwaki, Que., pointed out that 700 or 800 settlers in the Gatineau Valley drew revenue aggregating about $300,000 a year from the cutting and shipping of pulpwood during the non-farming season, and that if they were deprived of this source of revenue much harm would result.

* * *

Mattagami Company Busy

The Mattagami Pulp and Paper Company's plant at Smooth Rock Falls, Ont., is operating to capacity on unbleached sulphite. The company has produced 8600 tons of unbleached sulphite since the opening of 1923, up to March 1 and has marketed it all. Some 11,000 cords of pulpwood has been contracted for for the year, sixty per cent of which will come off their own limits and thirty-five per cent by rail from settlers. The output is being marketed by S. R. Armstrong, of Caledonia, N. Y., who has charge of sales for the receiver.

'BUSINESS—NOT POLITICS' IS SLOGAN

No Speaker Representing Political Party on Convention Program

RESENTING the display of partisan politics at Washington, the American Paper and Pulp Association for its annual convention the week of April 7 has adopted this keynote, "Business—not politics." In accordance with this policy there will be no speaker representing any political party on any of the programs of the Association.

Instead, Julius H. Barnes, President of the Chamber of Commerce of the United States, Frederick F. Fish, of the National Industrial Conference Board and Dr. W. Warren Giles of East Orange, N. J., will be the three speakers for the banquet program.

Mr. Barnes will speak on the organized business of the nation, and general business conditions. Mr. Fish on problems of industry, particularly such questions as immigration, labor and the like, while Dr. Giles will close with an optimistic message for the American business man. Dr. Nehemiah Boynton, the Association's long time unofficial chaplain will not be in New York at the time of the convention this year, but Dr. Giles is a speaker whose message will be no less impressive than the remarks of Dr. Boynton have always been.

Last year Senator Borah was one of the speakers, on other years other prominent political figures have been the convention orators, but the change this year is to evidence the sentiment of the paper manufacturers at least at the manner in which the country's needed legislation is being sacrificed to the political exigencies of a presidential election year.

* * *

Take Harbor Property

The Dominion Tar and Paper Company, a British company, controlled by the Earl of Dunmore and Sir Harold Walker, has leased five acres of harbor property at the foot of Saulter Street, in Toronto, for a period of twenty-one years and will erect a $200,000 factory which will constitute one of a chain of plants extending across the Dominion. The chief output of the plant will be by-products of coal tar.

* * *

Redeem First Bonds

Announcement is made that the Canadian Paperboard Company, Limited, which operates paperboard mills at Montreal, Frankford, Ont., and Campbellford, Ont., has redeemed the first installment of their outstanding $900,000 seven per cent bonds, amounting to $30,000 in accordance with the trust deed. A similar installment is required to be taken up the first of April of each year.

* * *

Operated to Capacity

The pulp mill which was erected by the Backus-Brooks Co. at Kenora, Ont., is being operated to capacity and it is expected that the new newsprint mill will be completed and running during the month of March. Splendid progress has been made on construction and installation of the equipment.

* * *

Good Bond Demand

Paper box factories are fairly busy at the present time and there is a moderate demand for board of all kinds. There have been no changes in prices for a long period and the plants are operating to fair capacity. With the advent of spring it is expected there will be.

News From New England

REVIEW OF THE PAPER SITUATION IN NEW ENGLAND

Outlook in New England Is Given, With Results of Study of Fundamental Conditions

NEW ENGLAND is in an important position relative to the papermaking industry. She has without doubt held an enviable position in the past in this respect; and has much to live up to, if this prestige is to be maintained.

Profitable papermaking in a geographical sense depends principally on three factors, coal, power, and raw materials. New England is a long way from the coal fields and suffers considerably because of the present high cost of transportation. With the gradual return to normal the coal prices are expected to readjust themselves and become more reasonable. Some time ago manufacturers anticipated relief through the West Virginia coal mines, which are said to produce a very good anthracite coal. However, the present difficulty is directly traceable to transportation rates.

The present outlook for lower freight rates is not good. Figures at hand, referring to railroad equipment, for the first time in many months would tend to indicate the country, as a whole, is confronted by the danger of a serious car shortage. The surplus of cars, built up before the first of the year, because of the increased demands for transportation facilities has been depleted to a considerable extent. In New England, especially, the unfilled demand for cars has taken a sharp turn upward. During the month of February the decline for the entire country was 70,000 cars, which is about half the number available one year ago.

This is a serious situation. Not only would the paper industry be effected from the standpoint of fuel; but also in all lines where prompt shipments are demanded. Many cars are now in the process of manufacture, and seem at this time to be the only means of relief. If the condition is not remedied, it is self evident, freight rates will start to soar.

To some extent the high cost of fuel is compensated for in some parts of New England by water power. In recent years water power legislation has been suggested for the State of Maine, which would have been most harmful to Maines' paper and pulp mills. Fortunately, these bills were never passed, and it is the duty of paper manufacturers to prevent a reoccurrence of this situation, if possible. If a car shortage is prevented, the outlook in regard to coal and power, as related to the paper and pulp maker is bright enough.

It is in regard to raw materials that the paper industry faces its most serious situation. Those mills, which make a specialty of using rags, rope, etc., are partially protected for the future, but mills depending on the use of pulpwood must view with some alarm the condition of our forests.

Many times the destruction of our forests is placed at the doors of the paper industry, which is entirely unfair. No single agency at work for the protection of our forests, has done more or labored harder for their preservation.

To many paper companies the protection of our forests is a matter of great importance and some mills have spent hundreds of thousands of dollars to protect their future supply of wood. More would be done but the expense involved is tremendous, and companies can not afford to add to their overhead, much as it is to their interests to do so.

Plans for reforestation are discussed in various states from all angles. The European plan has been adopted to some extent, but from the viewpoint of the present high level of wages and the heavy taxation, reforestation, as a private business is quite out of the question.

Protection is as vital an item in forestry as the establishing of new forests. Perhaps if the public realized to what extent our forests were depleted yearly by fires and insects decided action might be obtained. In Massachusetts, Harold L. Frost, Chairman of the Boston Chamber Commerce's Committee on Forestry at a recent meeting recommended increased state authority in fighting forest fires. It is felt each town cannot properly handle this important issue.

* * *

Conditions Steady

Conditions in the paper trade in New England are steady with consumption remaining about normal. Business for January, according to statistics, was far in excess of the same month a year ago, showing an advance of about ten per cent.

Sales of foreign kraft pulp remain about the same, or 2.50 docks while foreign chemical pulps showed little strength as the result of the strike in Norway which has seriously affected the pulp and paper industry of that country. Captains of ships recently arriving from Norway report plenty of pulp on docks in that country ready for shipment. Unless the strike continues for many weeks, a rise in imported pulp is unlikely. Mechanical pulps have not been imported in sufficient volume to make the strike have much effect upon them.

* * *

McGrath With Gilman

Maine has just parted with one of its best known paper men owing to the resignation of C. B. McGrath, general superintendent of the Grand Lake Paper Company, of Woodland. Mr. McGrath has left Woodland to accept the office of general manager of the Gilman Paper Company, in Gilman, Vt. as a testimonial of regard a number of Mr. McGrath's co-workers and fellow officers at Woodland, on the eve of his departure, tendered him a complimentary banquet at the Queen Hotel, St. Stephen, N. B., when speeches were made by George Kent, master mechanic of the St. Croix Paper Co., Peter Falbert, superintendent of the paper machines and others. Assistant Superintendent Leonard Miller officiated as toastmaster. Mr. McGrath was presented with a Shriner's ring and Masonic cuff links by employees of the paper mill.

VAN BUREN MILL IS CLOSED NOW

International Paper Company Closed for Indefinite Period

THE Van Buren Pulp Mill of the International Paper Company at Van Buren, Me., has been closed. The closing is for an indefinite period. The mill manufactures kraft pulp.

The entire output of this mill was formerly shipped to Rumford but when the Continental Bag & Paper Co., purchased the Rumford mill of the company, shipments to that point ceased. The Continental Company has been buying pulp at its source, mostly from Canada, at a saving of $15 per ton.

The plant has a capacity of 60 tons per day of pulp and about 300 have been employed. There has been some talk of the company installing paper machinery to use the pulp at some future date.

Closing down of the mill, according to paper circles, does not indicate a slump in the paper or pulp trade. It is the fourth mill to close down within a few weeks. Its closing is looked upon more in the nature as a change in conditions affecting that particular mill rather than to any change in the trade. Demand for newsprint, which comprises two-thirds of the company's output, shows no abatement. While the present price of newsprint of $75 per ton shows but small profit, it is sufficient to show a moderate profit to the company.

The Van Buren mills are among the less important of the company. The two mills recently closed at Watertown, N. Y., are also of little importantance as compared with other mills of the company. One produced high grade paper and the other newsprint.

The company states that the closing of the Watertown, N. Y., mills is probably but temporary, but as they are two of the oldest mills of the company, there are some in the trade who doubt if the mills are reopened. On the other hand, the company's plan for utilization of water power might result in the erection of a power plant of that kind and the reopening of the mills again. The company controls a potential 13,000 horsepower in the Black River but was using only a very small part of this power for its mills.

Demand for newsprint continues good and the International is producing about 1300 tons daily. The market for finer grades of paper has shown a slight decline but this decline usually occurs at this time of the year.

* * *

Building Addition

Thomas Strahan Company of Chelsea, Mass., paper manufacturers, is erecting an addition at Heard and Maple streets, that city, foundations for which have already been put in place. The structure will be of reinforced concrete and brick, one story and basement, 60x100 feet. Automatic sprinklers will be installed. The W. H. Whitcomb Co., of Boston, have the general contract.

Two Verdicts Returned

Two verdicts in favor of the Great Northern Paper Company were returned in the Superior Court March 6 by the jury that heard the cross actions of the above named concern and the Skinner Bros. Manufacturing Co. of St. Louis, Mo. The latter concern sued for $6,116.20 as alleged balance and interest due for patent air heaters furnished the Great Northern Paper Co. The Great Northern Company brought a cross action to recover $6,000 as paid on the heater account, claiming that the heaters were not satisfactory. The verdict in the first action was for the defendant, the Great Northern Company, and the latter was awarded a verdict of $6,195 in the other action.

* * *

Grange Endorses Plan

Two important actions regarding the future of Maine's water powers were taken last week in the statement issued by the executive committee of the Maine State Grange, an organization with a membership of 60,000 in this state, which is a definite endorsement of the development of Maine water powers by private interests, and similar action by the State Chamber of Commerce at a meeting in Bangor.

The attitude of Governor Baxter in opposition to the granting of franchises to private concerns prevented the endorsement to such extent of the Dead River Dam Co. by the last legislature and owing to uncertainty of legislative action in view of the state development views of the Governor and his adherents, there has been difficulty of late in attracting capital into construction depending upon water power development.

* * *

Dismantling Plant

Michael Blasberg and his brother, Peter Blasberg, have purchased the property and machinery of the Deerfield Valley Paper Company and the Deerfield River Railroad Company at Mountain Mills, Vt., and have started work dismantling the plant.

The mills manufactured a high grade of sulphite pulp with 60 tons capacity and was started in 1908. The rolling stock of the railroad comprised one locomotive and 70 cars, and operated between Mountain Mills and Somerset, being used to carry wood to the mills.

It is expected that the dismantling will take two years and about four million pounds of machinery are to be removed. The Blasberg Brothers reside in Turners Falls, Mass.

* * *

Authorize Bonds

Trustees of the Cushnoc Paper Company, at Augusta, Me., have been authorized by Judge F. J. C. Little to issue trustee bonds to the amount of $150,000 to provide for the purchase of pulpwood for the company. Judge Little was referee in bankruptcy for the company and it is believed that with this issue of bonds the affairs of the company may be straightened out and operations continued.

* * *

Will Be Dutiable

The Bureau of Foreign Commerce announces to St. Louis manufacturers that owing to a new tariff ruling in Mexico, cardboard or paper display cards or cardboard boxes (even those containing advertising) when imported containing merchandise or with it will be dutiable according to the merchandise with the paper and the duty will be computed upon the gross weight of the entire shipment.

BANKRUPTCY PETITION PREVENTS SALE

Petition Is Filed Just Few Hours Before Sale

FILING of a petition for involuntary bankruptcy within a few hours of the time set for sale by execution of the property of the Rainbow Mills Paper Company of Windsor, Conn., prevented the sale of the property by the Farmington Power Company. The mill was incorporated and members of the Kent family were active in its financing.

Three months ago the Farmington Power Company secured an order of execution of sale and counsel for the company at that time explained that it was the intention of the company to take the proceeds and turn them over to a committee of creditors to be divided on a pro-rated basis. The power company's claim approximated $5,000.

At a hearing before Judge Edwin S. Thomas of the United States District court at New Haven recently, the matter of appointing a trustee of the property was discussed. Counsel for a majority of the creditors was not in accord with the plan as a number of the creditors were old members of the firm. Judge Thomas advised as the best way out of the difficulty, the filing of involuntary bankruptcy petition, which would eliminate any misunderstanding and the case could be disposed of in the regular bankruptcy proceedings as prescribed by law.

The bankruptcy petition was then filed. Augustine Lonergan appeared as counsel for the power company and V. R. Parmalee of Hartford, Conn., represented the creditors.

* * *

Completes Drying System

The Rogers Paper Mfg. Co., Inc., Manchester, Conn., recently completed the installation of a new drying system in their East mill. The new equipment is now in operation, enabling the company to speed up their drying operations 50 per cent.

* * *

Rainbow Mills Bankrupt

The Rainbow Mills Paper Co., Windsor, Conn., filed an involuntary petition of bankruptcy, February 28th. E. Gross & Co. Inc., was the largest creditors with $5,000.

* * *

Fire Destroys Mill

The two-story building of the Neptune Twine & Cord Mills Inc., Moodus, Conn., was destroyed by fire March 9th, and the loss is placed at $50,000, which is partially covered by insurance. It is thought the fire was caused by someone carelessly tossing a match into a pile of refuse near the building. The company plans to build at once.

* * *

To Erect Building

The Foxon Company, Inc., Providence, R. I., manufacturer of gold labels, has awarded a general contract for the erection of a two-story factory building, 100x65 feet, of brick construction, to cost $40,000.

* * *

New Filter Plant

The Crocker-McElwain Co., Holyoke, Mass., has awarded a contract to D. O'Connell's Sons, 480 Hampden Street, Holyoke, for a new brick, concrete and mill construction filter plant and mill, 2 stories 30x100 feet, to cost $40,000. The company manufactures writing paper.

Goes to Draper Corporation

The Beebe River Mill of the Woodstock Lumber Co., is to be transferred to the Draper Corporation, of Hopedale, Mass. Legal documents for the transfer have been drawn up and signed. The Woodstock Company, however, will continue operation of the mill until May 1, 1925, in order to complete the handling of the soft wood on the 25,000 acre tract. The sale also includes the 25 miles of standard gauge logging railroad in the property. With the taking over of the property by the Draper Company next year, the manufacture of pulp will cease at the mill.

* * *

58th Banquet Held

The Boston Paper Trade Association held its 58th anniversary banquet Thursday evening, March 20, at the Algonquin Club, 217 Commonwealth avenue, Boston. The affair promises to be one of the most successful in the many social successes of this organization. Incidentally it will be the 149th regular meeting of the association. Officers for the ensuing year will be elected and the guests will include Governor Channing Cox, of Massachusetts, and Prof. Charles J. Bullock, of Harvard University. There will be a reception at six o'clock.

* * *

Propose New Mill

Much interest in the paper industry in Maine and New Brunswick has been caused by the report that a large paper mill is to be constructed on the border owing to the securing of option on a considerable amount of land near the Maine end of the International bridge across the St. John River between this state and Edmundston, N. B. This option appears to be the sole basis for the report but according to rumor the location of the plant is to be at Madawaska, Maine and the Fraser Company, Ltd., whose headquarters are at Edmundston, and the Brown Corporation whose parent organization is in the United States, but which controls several large pulp industries in Canada are alleged to be interested in the project.

* * *

Short Snappy Items

Plans are under way for a reorganization of the U. S. Fiber & Products Co., in West Sacramento, Cal. The plant used for the manufacture of cardboard is to be remodeled and equipped with a pulp mill. The reorganized company will have a capital of $300,000 ,and will have among its stockholders J. M. Henderson, Jr., Stuart Coulter and B. F. VanDyke, of Sacramento; C. A. Davis of San Francisco and George F. Goerl of Oakland.

* * *

Making Additions

The Crocker-McElwain Company, of Cabot street, Holyoke, Mass., is making extensive additions to its mill and filter plant on Cabot street, between the first and second canals. The addition will be of brick and concrete, mill construction, two stories high and 30x100 feet. It will cost approximately $40,000. D. O'Connell Sons, of Holyoke, have the contract.

* * *

Captain H. E. Ellis, 27 Seventh Avenue, Hialeah, Fla., is interested in formation of a company to establish a plant at that point for the manufacture of paper from sugar cane, bamboo and grasses. The mill is to have a daily capacity of 25 tons, and the first output is to be book paper.

PAPER PRODUCTS

Fiber Shipping Case Economies

Important Features of Value to Every Industrial Plant Are Explained

By **WILLIAM A. VOLLMER**

Sales Promotion Manager, Robert Gair Co.

PERHAPS the outstanding superiority of American business over older countries has been in the improvement of distribution methods. The turn toward package merchandising which had its real inception in 1897, while increasing the great public demand for branded goods, also resulted in so much greater facility of distribution that the two forces acted together in spreading the sale of all manner of products.

With the rapid extension of the package idea, came the question of packing for shipment. There must be standard units purchasable in large quantities and as uniform in character as the other elements of packing. The fiber case, hitherto in the experimental stage, attracted the attention in this connection of both shippers and paperboard manufacturers, and since 1906 has had an astonishing growth in public acceptance.

In the endeavor to point out some factors of the economic value of this form of shipping case, it is perhaps worth while to discuss, first, certain general phases which bear upon it.

Though we, in the United States, may have developed efficiency in many fields of performance, it cannot be said that in all cases we have paid strict attention to the incidental waste. Fortunate in enormous forest resources, we have been so lavish in their destruction that the *most sanguine* experts report that at the present rate of consumption the existing lumber supply will become exhausted in 150 years. Even the casual visitor to Europe may be struck by the difference in the attitude toward forest preservation and the destruction of forest products. American soldiers casually burning boxes seemed to the French faggot-gatherer to be committing a sacrilege. Yet that is the normal fate of most of the wood cases which make up the vast total shipped annually in this country. It may take some stress of sacrifice to teach America the spirit of conservation.

Meanwhile, however, the use of fiber is accomplishing this very vital saving. There is only about 10 to 15 per cent of new wood product used in the fiber case as compared to the lumber in the wood box of a like size. Best of all, however, the fiber container is not attractive to the builder of bonfires and certainly not useful in kindling. At the same time it is the most satisfactory form of waste for re-conversion into paperboard for new boxes. The improvement in the organization of waste collecting agencies and the greater public understanding that waste paper can bring income, is daily acting as a force in the conservation of timber which certainly is desirable from many points of view. Interesting statistics might be obtained relative to the amount of income received by the management of our big office buildings from the sale of paper waste.

The shipper is concerned with but two primary problems. What packing can he use to deliver his goods in satisfactory condition, and what will be the least expensive container, both from the point of view of cost and packing expenses? No claim has been made by fiber box manufacturers to the universal suitability of their products for all shipments. In the fields, however, where such cases have become the standard of shipping practice, as well as where they are rapidly becoming established, they have a demonstrable superiority, and occasion very significant savings. It is our purpose to point these out categorically and give certain characteristic instances.

First of all, a word will be given upon the recent developments in research to establish manufacturing standards and the methods of testing containers for their suitability to stand the stress and strain of trans-continental shipping.

When the fiber case passed beyond the experimental stage and its general use in transportation was extended, it became subject to the regulation of the Classification Committees of the Interstate Commerce Commission. Two types of boxes had sprung into use: One was the corrugated case made of two 'jute liners" separated by a thin sheet of strawboard fluted or corrugated. Strawboard has great resiliency and with study, the proper angle of corrugation was arrived at. A cross-section of this board shows two tough pieces of fiber-board held apart by a row of arches working exactly as the truss in bridge construction, to provide the maximum amount of support with the minimum amount of material. Due, then, to the material and the construction, a sheet of corrugated board has great resiliency and acts as a shock absorber to blows received in transit.

Solid fiber cases use the name "liners" of fiberboard or pulpboard, combining them by pasting to several plies of chipboard, which makes a solid filling in place of the corrugated strawboard. This laminated paper construction, as it is treated by the manufacturer, makes a particularly tough and leathery box strongly resistant to puncture from contact with sharp corners.

Rule 41 of the Consolidated Freight Classification prescribes the specifications of material to which the manufacturers must conform in making fiber boxes. Liners of definitely prescribed thickness must be used in each of the standard grades of fiber cases. The resistance of the combined board must show a certain minimum bursting test of a definite number of pounds pressure to the square inch for each type of material used. There are also dimension and weight limits stated for boxes of each grade of board. Each box-maker puts his certification stamp upon each box to show that these regulations have been complied with. It must not be supposed that the certification means that all boxes are therefore uniform; conscientious box-makers manufacture goods considerably in excess of the minimum requirements.

Standardization of Packing

The chief reason for touching upon this phase of the subject is to point out that the fiber package is subject to a definite amount of standardization. It is made of materials which can be controlled to almost negligible variability. Hence when the right size and shape of package have been determined upon, it can be expected that the future supplies will be uniformly satisfactory. It is, of course, impossible to control native, elementary manufactured products, such as lumber, to anything like the same degree of consistency; hence certain tests for standards show a much wider variation in wood boxes and prediction cannot be made with the same expectation of constant performance.

Having a raw material which can be kept within standards of scientific exactness, and manufacturing it into boxes under controlled standardized processes, there was need of testing methods which did more than check the material used in containers. Something had to be found which could test their utility function and their performance prior to the actual risk of shipment. The so-called United States government model drum-tester has accomplished this, so that now the suitability of fiber boxes for the individual needs of shippers can be developed through research, and, particularly important, the most serviceable interior packing can be judged through comparative experimentation. The first machine of this sort was devised by J. A. Newlin, who was in charge of the Forest Products Tests at the Madison Laboratories of the United States Forest Service. He conceived the idea for testing the strength of wooden containers of various types of construction, types of wood, and thickness, and also to test the holding power of nails. On each of the six sides of the hollow drum, which forms the drum-tester, cleats or battens are nailed. As a result of experimentation, these are so placed that they hold the box, as the drum revolves, until it falls first on one corner, edge, and side, and then on another in sequence, the drum automatically duplicating all possible shocks that a package may have in transportation. After the drum was installed at the Forest Products Laboratory, it was adopted by several large users of packages and one or two manufacturers of cases. These were adopted some time in 1919. In many cases where drum tests have been made, sample actual shipments of similar packing were also made. This check has been given by almost every owner of a drum-tester; and actual use substantiates the reliability of the laboratory test.

Having endeavored to sketch the theory and development of fiber cases, let us take up the discussion of fiber case economies which have been established through their use. In a loose acceptance of the terms they fall into two classes of savings over earlier methods of boxing—savings in distribution and savings in production. Under the first heading is the primary saving of investment in shipping material. Fiber cases are considerably less expensive than wood. Box for box, depending upon size and construction there is a reduction of first cost often aggregating 50 per cent. The second saving is in freight. Fiber cases weigh from 50 to 75 per cent less than wood, the variation depending chiefly upon size. This produces a cumulative saving that appears at three stages in the sequence of transportation. The first reduction is in the haul from box manufacturer to the packer's plant. Fiber boxes average from 8,000 to 10,000 to a car, can be loaded to fill the space entirely, and make a weight saving on each shipment that is considerably worth while. Since, as a rule, the big fiber box manufacturers are located near the market they serve, there is in many instances a reduction in length of haulage over that required to ship box lumber from the woodworking base—usually placed near the forest regions and away from manufacturing centers.

When the packer's product is shipped to his wholesaler's distributing point, this freight-weight-saving is again operative; so also for the third time, from the jobber to the retailer. This triple saving can result in commodity selling prices materially lower than are possible with wood cases, a very helpful thing on such highly competitive markets as exist today.

The second class of savings, which we have called production savings, occurs in facilitating the flow of manufacturing processes in the company of handling and in the reduction of overhead. Corrugated and fiber cases are complete units in themselves. They come in bundles which are very easily loaded on trains, unloaded at manufacturers' plants, and stored flat. In the space required to store 10 complete wooden boxes, a hundred knocked-down fiber cases may be placed.

Co-ordinating Speed of Production

There is another phase of this space-saving, which has to do with the processes of assembling. Even though the components of a wood box are in the form of shooks, some sort of carpenter shop is required to make the best economy of the material. There is always a certain amount of noise and confusion, which makes it necessary to have this last stage of the production process somewhat removed from the final operations of packing individual cartons, bottles, and the like. As has been previously indicated, one of the significant advances in package business is the remarkable development of automatic packing machinery. Unit containers are filled, sealed, weighed, and set up automatically with the use of minimum personnel and exceeding precision, at high speed. In order not too greatly to extend the area of the packing-room, there has been a problem in many industries to keep the packing of shipping cases up to the production speed of delivery at the end of automatic machines. Fiber containers, being complete units, can be packed at these machines, sealed, and delivered by the simple gravity or other form of traveling conveyors to the loading platforms and into the cars.

The savings incidental to the use of corrugated and fiber shipments are all greatly demonstrable in the individual experience of each user. There are general economic features, however, which, though no dollar and cents value may be placed upon them, nevertheless are just as important. By its smooth construction, having no rough edges, projecting points or wire binding, the fiber case is very easily lifted and handled.

TWILLER SALES TALKS

In an abundance of talk there is confusion. Wise words are few.

* * *

Hasty judgments work havoc. Slow decisions are sure.

* * *

Give another credit for being right, you can be wrong.

* * *

Don't always try to be the whole thing, the world was here before you came and will be here after you go.

* * *

Every successful man has made mistakes but he is an ultimate success. Don't point out his errors, look after your own.

Cancellation

In the March issue of "The Nation's Business," Mr. William Haynes, publisher of "Drugs and Chemical Markets," writes an article on "Let the Seller Beware," in which he calls attention to the evils and the immorality of cancellation.

There is no doubt but that this evil reaches into the paper and paper specialty trade. The use of cancellations by buyers causes untold hardships to manufacturers, it places them in a position undesired and unfair. The buyer becomes careless in his buying and the salesman less serious in his selling.

There should be one code of honor in selling and buying.

Just as the buyer expects and compels the seller to give the quality and the price, so must the seller be compelled to look upon the order as a sacred contract not subject to cancellation. There is a mutuality of interest in this method which preserves both the buyer and seller from financial hardships.

* * *

Annual Dinner Held

The annual dinner of the Metropolitan Bag & Paper Jobbers' Association of New York City was held at St. George Hotel, Brooklyn, on the evening of March 13th.

There was an attendance of two hundred and they all enjoyed the usual good time they have at their picnics and dinners.

The officers of the association are, J. Berger, President; S. Greenberg, Vice President; P. Karlsruher, Treasurer; Wm. P. Otter, Secretary.

The entertainment committee is made up of A. E. MacAdam, Jr., Chass Woolney, Clarence Stein and Nelson Berger.

* * *

To Have Booth

The American Association of Paper Specialty Manufacturers, now in process of formation, will occupy Booth No. 68 in the Paper Industries Exposition.

Paper Specialty Manufacturers are invited to make the booth their headquarters at the show.

Every detail of the organization will be explained and the plan of operation will be open for inspection.

* * *

Arranging Meeting

A meeting is being arranged for the week of April 7th, for a free and open discussion of a plan for the organization of The American Association of Paper Specialty Manufacturers.

WHAT'S IN A NAME ASKS WILLERT

A Discussion of the Value of a Name and Reputation

By J. E. WILLERT

A ROSE would smell as sweet by any other name." This would be true if the rose had started with any other name, but would not be true if the name was changed now.

We have been associating the name rose with the most beautiful and fragrant flower that grows, we visualize it in all its varieties. The name is so impressed on our mind that the rose would be completely destroyed in our loves and in its influence on our lives, if the name were changed.

A name is only our designation for anything, our expression in language by a word, which carries in its meaning the whole power, working ability and influence with which the object is endowed.

The name table brings to our mind what a table will do, the varieties of tables we indicate by adjectives that describe to the human mind their several attributes.

The brevity of a name adds to its value in quickness of speech, ease in memory and shortness in description.

This principle, recognized in commercial life in the designation of commodities, has made a lasting impression on the public mind, has become a guide in its purchases, enlarged its vocabulary and enriched its expression.

The manufacturer who adopts a list of names that follow in sequence, and are closely associated with either the ability of his product, the place of its production or connected with the product's intention, soon makes his products prominent in the buyer's mind.

Names must be euphonious and attractive, also lasting in the memory.

The paper trade is replete with names in watermarks and brands, some of great descriptive value, others valueless, some carry with them the thought of their intention and suggestion of their use, others are merely the creation of a mind reaching out for something different and completely void of any practical idea.

The virtues exercised by a commodity should be in such close harmony with the name that, by the use of the commodity, the user discovering its virtue should immediately find the name creeping into his mind.

What's in a name? Everything, provided the commodity in its performance warrants the designation.

A rose cannot be a rose unless it lives up to the reputation of a rose, when it fails it is a thing despised.

So with any commodity of any name, if it is remiss or does not show in its use the attributes claimed, it is rejected by the public mind.

* * *

The Piedmont Paper Box Co. has been incorporated in Charlotte, N. C., with a capital of $50,000, by R. E. Ballinger and A. S. Menzies, of Hickory, N. C., and C. W. Ballenger, of Tryon, N. C.

* * *

The Fiber Craft Chair Co. has acquired the building of the Hermitage Distilling Co., Frankfort, Ky., as a factory and will make fiber chairs with spun paper seats and backs.

* * *

The Princeton Hosiery Mills, Princeton, Ky., is figuring on installing the necessary machinery for the manufacture of its own paper boxes.

But Caesar had no Printing Press

Julius Caesar built up a vast dominion by the force of his own personality. When Caesar was gone the empire crumbled. The different parts had no common ground of thought to hold them together.

Lack of communication was a serious handicap in ancient times. Word-of-mouth messages get to their destination slowly and inaccurately. A growing world consciousness depends upon an easy and accurate diffusion of information.

Printed sheets of paper brought men out of the Dark Ages into our modern civilization. The printed page has the power to move minds, a hundred or a million at a time.

To make the printed page broadly available is in large part a responsibility of the modern paper maker.

McBAIN'S PAGE

Shipping-Rolls of Paperboard

By **B. T. McBAIN**

Assistant General Manager, Nekoosa-Edwards Paper Company

NOT only is the tonnage of paperboard in the form of rolls as compared to sheets increasing, but the sizes of rolls specified by the customer is still another proposition for the producers of board to wrestle with. Where a comparatively few different sizes of rolls were formerly called for, it was a simple matter to rig up for producing them, but now the customer's demands range all the way from ordinary shipping size roll, say, for instance, 40″ wide and 40″ diameter, up to rolls which might be 60″ diameter and only 10″ wide. There is an equally great variety in the kind of core or diameter of hole in the center of the roll. Some customers want their rolls wound on wood slat cores, others on solid wood cores with a square hole, and still others on iron pipe. Others again specify rolls without cores and a hole possibly 3″ or 4″ diameter.

What is the mill man going to do to get out from under this variety of demands? What he usually does is to accept only such business as he can comfortably handle on the winder he already has, or talk the customer out of his notions as to wanting this or that in the way of excessive diameter or narrow width or freak kinds of cores or no cores at all. It is not always feasible to talk the customer out of the preferences he may have. Usually he keeps prowling around until he finds a mill with modern equipment that can produce the kind of rolls he wants, and leave the salesman flat who is trying to sell him what he does not want.

When it comes to shipping the rolls of board, a new difficulty presents itself where the customer demands rolls of extra large diameter, say, for instance, 60″ diameter, and also wants them straight and even on the edges, firmly wound and frequently also wants rolls of very narrow width in this large diameter.

A roll which is poorly formed, that is to say, of mushy density rather than firmly wound and also irregular as to the edges, is certainly a mean proposition to handle in shipping, and equally mean for the customer to utilize. A roll irregular as to the edges requires not only that it should be wrapped on the outside, but also that a certain amount of padding should be used on the ends to prevent excessive damage in shipping—and this costs time and money.

Modern methods of winding rolls solve these difficulties. Not only do they cover the difficulties of producing the rolls, but also minimize the expense of preparing same for shipment.

It is a matter of arithmetic, and a simple one at that, for the average mill man to figure how much he has already invested in mill equipment, including land, buildings, machinery, etc., to actually make the board; and to figure whether the additional investment of possibly one-half of one per cent of this amount in a thoroughly up-to-date Slitting and Roll-Winding Machine, would not be a good proposition; especially as the saving of such a machine in the production of rolls at the minimum of operating cost and broke, combined with the saving in shipping difficulties and expense, would probably save the cost of the machine within half a year. That is easy enough to figure.

But there is another factor in favor of modern Roll-Winding equipment, and that is that the mill having it will gradually come to have the preference of the customer utilizing board in rolls.

Waste in the Pulp & Paper Industry

Pacific Coast Mills

By **B. T. McBAIN**

Assistant General Manager, Nekoosa-Edwards Paper Company

THE most economically arranged and manned mills on the Pacific Coast is at Port Angeles, Wash.

There are nine hand fed electrically driven pulp grinders using four foot wood.

There is a sulphite mill with Tower system and two 16x52 digesters.

There is a paper mill with two 164″ machines, producing 150 tons of newsprint paper per day.

There are all the auxiliary and necessary shops, wood mills, etc., and yet this plant is operating with much less than two men per ton of finished product.

The Groundwood mill is a closed system as far as waste is concerned and is very economical in power use, as well as labor.

The paper mill is equipped for re-use of all white water possible and every known labor saving appliance used.

These mills are using small spruce and hemlock such as the other Pacific Coast mills reject, yet this old waste of the forests is being used and a better product results.

These mills are located on the shores of the Sound, have the benefits of both rail and water transportation and can reach the markets of the world better than any of the other Oregon and Washington mills. They have their advantages and their disadvantages but those responsible for their planning and operation have certainly made the best of all their advantages and have overcome most of the disadvantages as well as could be.

Their market is the world. It is not going to be long before the Atlantic Coast will be supplied with paper from the Pacific Coast paper mills by steamer through the Panama Canal and today those mills located on tidewater as well as on rail, have a great advantage over their competitors not so logically situated.

Keep an eye on the Washington Pulp & Paper Mills.

The economic problem of securing an adequate supply of paper

THE book is of special interest to everyone connected with the pulp and paper industry and equally so to all users of print paper. It points out clearly what must be done to develop sufficiently our supply of pulpwoods. It shows the steps necessary in forest conservation and discusses the subject from the practical viewpoint of industrial needs.

Pulpwood and Wood Pulp in North America

By ROYAL S. KELLOGG

Author of *Lumber and Its Uses, The Cost of Growing Timber, The Timber Supply of the United States*, etc.

270 pages, 6x9, 87 illustrations, $4.00 (*English price 20s.*) *net, postpaid*

The book describes the pulpwood industry, the processes of making paper pulp from wood, the timber supply of North America, the need for increased timber production and the future possibilities of the pulp and paper industry. Detailed statistics of production and consumption since the establishment of the industry are given in the appendix and shown in the text by means of graphic charts of unusual effectiveness. The book also carries many illustrations typical of mill operations and forest scenes.

Do You Know

That 100 million cords of pulpwood have gone into paper in the United States and 30 million cords in Canada?

That paper-making is a billion-and-a-half-dollar industry in North America?

That a permanently self-contained operation for the manufacture of 100 tons of news print paper daily may require the equivalent of an investment of $10,000,000?

That the United States and Canada produce and use as much paper as all the rest of the world combined?

That the per capita consumption of paper in the United States is 150 lb. yearly?

How much pulp may be made from a cord of wood?

How much pulpwood and wood pulp has been exported from Canada?

How much pulpwood and wood pulp has been imported into the United States?

What are the pulping properties of 70 species of American woods?

What are Forest Regions of North America?

How much and what kinds of timber there are yet left in the various regions of the United States and Canada?

How much forest land in North America is publicly owned and how much privately?

What regulations apply to timber cutting in the public forests?

What are the essentials of a forest "Working Plan"?

That forestry is the application of definite scientific principles to the growing and using of timber crops?

What it costs to grow timber?

Who is responsible for the maintenance of the timber supply of the United States and Canada?

What are the essentials of a National Forestry policy?

That without forestry there is no adequate, permanent supply of paper and other wood products in America?

That there is no sense in delaying the effort to maintain the American timber supply on the false assumption that we can turn to any other part of the world for any considerable part of the wood products essential to our well being?

WIDE RANGE OF SUBJECTS HERE

Superintendents Will Hear Discussions on Many Topics of Interest

A PROGRAM discussing subjects ranging from apprenticeship in the paper mill, vocational education, to the most highly technical problems confronting the paper mill superintendents has been practically completed for the annual convention of the American Pulp and Paper Mill Superintendents Associatio in Dayton, Ohio, in May, under the direction of H. W. Server of the Miami Paper Company, West Carrollton, Ohio, general chairman.

The convention is to open at 9 A.M Thursday, May 22 at the Miami Hotel. Papers on various problems that confront the superintendents will be presented by authorities at morning and afternoon sessions. The banquet will be held at 7 P.M.

The general business session will be held on Friday morning in Dayton, followed by luncheon at the Manchester Hotel in Middletown, Ohio. The divisional meetings will be held in the afternoon at various places in Middletown. Friday evening at the banquet, which will be held at the Dayton Country Club, "Dusty" Miller, a country editor who is fast becoming famous as an afterdinner speaker, will talk. Charles F. Kettering, president of the General Motors Research Corporation, may have a place on the banquet program, as also will Martin Collins, of the Graham Paper Company, St. Louis.

Saturday will be given over to visits to the various mills and plants of the allied industries of the Miami Valley, many of whom are making special entertainment features for all the visitors.

The following is a partial list of the papers that have been prepared for the convention and will be given during the sessions on Thursday and Friday.

"Apprenticeship in the Paper Industries,"—George P. Hambrecht.

"Building and Maintenance of an Organization,"—Robt. B. Wolf, R. B. Wolf Co., 42 Broadway, New York.

"Employment Problems,"—Frances S. Pope, Mead Pulp & Paper Co., Chillicothe, O.

"The Beater of Today,"—Charles Shartle, The Shartle Brothers Machine Co., Middletown, Ohio.

"Drying of Paper,"—E. P. Gleason, C. E., Nekoosa-Edwards Paper Co., Port Edwards, Wis.

"The Development of Recording Devices as Applied to the Art of Papermaking,"—M. A. Goetz, General Electric Company, Schenectady, N. Y.

"The Use and Abuse of Papermaking Felts in Paper Mills,"—M. C. Burrell, Orr Felt & Blanket Co., Piqua, O.

"Steam and Power in Pulp and Paper Mills,"—H. S. Taylor, President T. A. P. P. I., Dayton, O.

"Manufacture and Use of Bleached Ground Pulp,"—Lyman Beeman, Cons. Waterpower and Paper Co., Grand River Rapids, Wis.

"Vocational Education,"—Harry P. Carruth, Genl. Manager Mead Pulp & Paper Co., Chillicothe, O.

"Papermaking Fibres."—B. S. Summers, Port Huron, Mich.

"Beating of Kraft,"—A. W. Bronk, Deerfield Valley Paper Co., Mountain Mills, Vt.

"Tinting of White Paper,"—John R. Roberts, E. I. du Pont de Nemours & Co., Wilmington, Del.

Send New Instruction Card

The Mathieson Alkali Company has just sent out to their users of Liquid Chlorine a new instruction card for the use of this product. It is printed on sturdy linen stock capable of standing the wear and tear of the mill for a long period. It details the use of the ton container, giving the vital facts necessary to know in a brief manner.

Swedish Pulp Production in 1923

There was a relatively large export of Swedish wood pulp during December, 1923, amounting to 194,605 metric tons as compared with 119,620 tons in November. Preliminary statistics indicate that the total exports of all kinds of Swedish wood pulp in 1923 were only slightly below those for the previous year, being 1,044,216 tons (including wet pulp) as compared with 1,170,435 tons in 1922, writes consul Walter A. Leonard, Stockholm.

Of wood pulp, it is estimated that 66,000 tons of bleached and 680,000 tons of unbleached sulphite, 235,000 tons of sulphate, and 300,000 tons of mechanical pulp were produced in 1923, as the estimated annual capacity of the Swedish sulphite mills is 880,000 metric tons and that of the sulphate mills is 285,000 metric tons.

This estimated output is close to 85 per cent capacity.

Exports to the United States in 1923, based on the declared exports certified at the consular offices, were valued at $19,724,463, distributed among the different classes as follows: Sulphite, $12,494,243; sulphate, $4,684,389; kraft pulp, $1,184,497; soda pulp, $854,392; and mechanical ground wood, $506.942.

Look for Mathieson

The Mathieson Alkali Works at the Paper Industries Exposition will have booth No. 41, and will be in charge of R. J. Quinn, Assistant Manager of Sales, assisted by J. D. MacMahon, and G. N. Davis.

The company will exhibit a large model of the Mathieson Multi-Unit Chlorine Gas Tank Car, which has recently been approved in an important decision of the Interstate Commerce Commission. The model will illustrate the many unique features of the Multi-Unit car, together with the unloading by means of a manifold and headers. A full-sized Mathieson Ton Container, as used on this car, will also be exhibited in the booth, sectioned at one end to show the construction in detail.

Exhibit material will include literature describing the Mathieson System for preparing bleach liquors from Liquid Chlorine, and samples of "Eagle-Thistle" Caustic Soda, Soda Ash, and Bleaching Powder.

* * *

Buys Large Timber Tracts

The Fisher Body Corporation have purchased approximately 100,000 acres of standing timber in Tennessee, Arkansas, Louisiana and Mississippi as a "further extension of its policy for insuring an uninterrupted flow of raw materials." The property will be operated by a subsidiary, the Fisher-Hurd Lumber Company, of which O. P. Hurd, of Memphis, Tenn., will be the president and general manager.

The price of the timberlands was not given out.

GETTING RID OF THE SEASONS

By WILLIAM R. BASSET

President of Miller, Franklin, Basset & Company, Inc.

OF all the so-called "unsolvable" problems of business, perhaps the most expensive and the least necessary is the problem of seasonal production.

Few concerns make any effort to solve the problem. They accept it as unalterable, probably in the belief that the seasons are an act of God. If they are rich they pile up inventories for a short selling season by keeping the plant going the year round. If they can't finance that, they shut their plants down.

Yet every year a few more concerns succeed in doing away with seasons. A branch of the garment industry reduced costs and prices enough by year round production to greatly lengthen the selling period. Another business reduces prices in the off-season as an incentive to its retailers to buy then.

A soap manufacturer found that it was the jobber who had the seasonal hallucination. When he went direct to the retailer he found that people wash with soap the year round. He now guarantees year round employment to his workers.

Even the building industry which comes in closest contact with cold and snow has found that in most climates construction can go on in the winter as well as any time. The American Construction Council has shown that the building season can be lengthened and hopes ultimately to do away with the peaks and valleys in its industry entirely.

When more concerns cease hibernating during off seasons, their profits will be bigger and labor troubles fewer. A little study will show any industry that it need not have such violent seasonal fluctuations.

With Gottesman Company

James Rosenberg, formerly president of the American Woodpulp Corporation, has now become associated with M. Gottesman & Company, Inc., 18 East 41st Street, New York, N. Y. Gottesman & Company were established in 1886, since which time they have developed an extensive business with American and Canadian Paper and Pulp manufacturers. M. Gottesman & Company, Inc., also have their own offices at 13 Stureplan, Stockholm, Sweden, for the control of their European business, which is considerable.

* * *

Norwegian Lock-Out

The paper and pulp mills of Norway are still in the grip of the extensive lock-out which involves practically all the industries of the country. The second instalment of the lock-out was to take effect on Thursday this week, and in the absence of any news to the contrary it is to be presumed that this intention was carried out.

It is stated that some 70,000 workpeople in the pulp and paper plants of Norway are idle. Being on such a large scale it is thought that the dispute cannot be of long duration.

LATEST MARKET REVIEW

THE CONTINENTAL MILLS MAKE ANNOUNCEMENT

Formal Announcement of Change Is Made by Company

THE Continental Paper and Bag Mills takes pleasure in making announcement to the Trade of its reorganization under the name of Continental Paper & Bag Mills Corporation.

In addition to taking over the properties and well known mills and factories of its predecessors as enumerated herewith on this page the Continental Paper & Bag Mills Corporation has acquired the paper mill property at Rumford, Maine, previously owned by the International Paper Company, with a daily production of 200 tons of bag and wrapping papers.

The Continental Paper & Bag Mills Corporation, controlling vast tracts of the finest timberlands in the United States and Canada, and equipped to make the chemical and mechanical pulp required for the manufacture of over 400 tons of a great variety of paper products daily, is in a unique position to serve the trade with dependability.

What the Ticker Says

Continental Stock Issue

The Continental Paper & Bag Mills Corporation, a Delaware company, has now a total authorized capital stock of $17,500,000. It anticipates using about $2,356,550 of this amount in construction and mill work in Wisconsin.

Just what the proposed expansion is in Wisconsin is not known and no information could be elicited from the company.

Paper and Board

New York, March 18—Reports from numerous quarters and almost without exception tell of demand for the various kinds of paper developing in a steady manner and in fair volume. It is true that the movement of some kinds of paper is not broad enough to keep all the mills of the country working at anything like capacity production, but at the same time it is generally admitted that paper is being consumed in fully normal volume and that users, dealers and distributors are absorbing supplies in a consistent way and in sufficient amounts to create a moderately active market.

Mills in a great many cases are operating on a larger scale than earlier in the year. The usual stimulation of spring business is beginning to be felt and it is noticeable that orders from consuming sources frequently mark an increase in the volume of buying. Paper buyers almost as a unit continue to purchase mainly against actual and immediate needs but the requirements of some are growing in such measure as to necessitate orders for bigger quantities of paper. The outlook for further increased business as the spring draws nearer is very favorable; in fact there are many in the trade who expect a marked broadening of demand within the next few weeks, and it can be said there are numerous signs that such expectations will be realized.

Print paper still leads all other descriptions of paper in point of demand. Newspaper publishers are absorbing newsprint in large tonnage—there is fully as heavy a movement into consuming channels at present as at anytime in the past year or so, if not a slightly larger movement in some directions—and most print paper mills are actively engaged turning out their product at close to maximum capacity. Prices of newsprint are firm. Sheet news is enjoying a brisk demand as well as roll news, and there is a good call for side runs. Available supplies of newsprint in the open market are far from what could be described as plentiful; instead a majority of manufacturers are sold well ahead and have but little of their output to offer to transient buyers.

Demand for book paper is holding up fairly well and reports state that a gradual increase in the movement is to be noted. Printers are buying in a reserved manner and seldom order paper until they are in need of it but there is nevertheless a vastly improved market situation in all kinds of book paper over that prevailing not long ago. Prices of book papers tend to harden. No actual advances are reported though it is not so easy for buyers to secure concessions as it was and quotations on some lines show a distinct tendency to rise.

Coarse papers are firmer in tone and are wanted in at least slightly larger quantities. One reason for the improvement in kraft wrapping is said to be the removal of the Scandinavian mills from competition, temporarily at least, owing to the difficulties in getting shipments out of Sweden due to the frozen Baltic. Domestic manufacturers of kraft are securing more orders and are speeding up their production to some extent.

There is a good demand for most specialties. Cover papers are finding a fairly broad outlet. Bristols are in better than average demand, and there is a steady movement of bonds and ledgers of various qualities with the lower grades leading in demand.

Box boards are comparatively slow. There have been reports of further price cutting on the part of some mills apparently in an effort to obtain a larger percentage of the business available, but board quotations continue to range around $42.50 a ton f. o. b. New York for plain chip, and $45 for news board. With the spring near a larger movement of board is anticipated,

Mechanical Pulp

Prices of ground wood have shown some easing, due, it would appear, to available stocks being fully up to the requirements of consumers, notwithstanding reports that certain grinders have been compelled to curtail their production because of unfavorable water conditions. Domestic grinders are reported selling spruce ground wood at $30 a ton in some cases though quotations generally run a little above this level, between $32 and $33 being the prices more commonly asked. Imported ground wood is reported available at around $32 a ton ex dock New York and other American Atlantic ports. There is a fairly good demand but buyers seem to be experiencing no trouble in covering their wants. The movement is confined largely to contracts, the transient demand being declared a more or less negligible quantity at the moment.

Foreign and Domestic Chemical Pulp

The tone of chemical wood pulp prices is slowly but surely strengthening. Those on the selling end of the trade appear less disposed to book ordres at other than the prices quoted, and conumers are finding it more and more difficult to buy pulp at the concessions which were rather freely granted up to a short while ago. Indications are that there is less pulp held unsold by producers, dealers and importers, and it is probably this which is leading to the firmer price undertone since selless disposed to book orders at other than the prices quoted has been thus far little advance in market levels. Buyers are evidently getting the supplies desired at such prices as have prevailed for some time and have not been obliged to pay higher figures.

Bleached sulphite is quoted at 3.75 cents to 4.25 cents a pound ex dock New York for No. 1 foreign sulphite, and 4 to 4.50 cents f. o. b. pulp mills for No. 1 domestic bleached sulphite. Scandinavian kraft pulp is selling at around 2.60 cents a pound ex dock New York, while foreign easy bleaching sulphite is quoted at 2.75 to 3 cents on the dock. News grade sulphite is moving fairly freely at a price range of 2.50 to 2.75 cents at pulp plants. Quotations ex dock New York and f. o. b. pulp mills follow:

Sulphite foreign—			
Bleached No. 1	3.75	@	4.25

Kraft, foreign	2.50	@	2.75
Kraft, domestic	2.60	@	2.90
Sulphite screenings, refined	1.50	@	1.75

Domestic Rags

There has been a slowing down of demand for most grades of papermaking rags. Apparently consumers have covered their wants for a while and therefore are in a position where they are able to hold off in buying to some extent, with the result prices on most classes of rags have eased slightly. It is noticeable that the price reaction has affected chiefly the lower qualities of rags. Roofing stock which was so strong in price is on a lower cost leve, sales of No. 1 packing at 2.40 cents a pound and of No. 2 grade at 2.25 cents f. o. b. New York having been reported, these prices representing declines of $3 to $4 a ton from recently ruling market levels. Old whites are fairly steady, and thirds and blues are holding in price. New cuttings of most kinds also are quotably steady. Dealers quote 14 cents a pound and higher for No. 1 white shirt cuttings f. o. b. New York, and blue overall cuttings are quoted

Paper Testing Methods
(1922)

A large edition of this handbook for paper mill laboratories was exhausted shortly after the type had been distributed. In view of the insistent demand the Technical Association has arranged for a republication and *Paper Testing Methods* is again available at $3 per copy.

The work covers detailed procedure for microscopical analysis, physical testing and chemical analysis of the paper with descriptions of the apparatus employed.

It is the only complete and up-to-date handbook on paper testing published in the English language.

It should be in the hands of every paper manufacturer and paper dealer as well as concerns who are large users of paper.

Imported Rags

A fair demand is reported for foreign papermaking rags and no broad changes are noted in quoted prices though some of the cheaper grades have declined slightly. Dark colored cottons are quoted at 2.40 cents a pound ex dock New York, and in exceptional cases at a trifle less, recording a little drop in the value of these rags. Quotations on an ex dock New York basis are as follows:

Lins., White, No. 1 ..	15.00 @ 16.00	German Linen, blue ...	4.50 @ 5.00
Ger. Blue Cottons	3.25 @ 3.50	German Linen, grey ..	6.00 @ 6.50

New Unbleached	10.50 @ 11.00	Dk. Colored Cottons ..	2.35 @ 2.50

Bagging, Rope, Etc.

Old rope continues in good demand and firm in price. Dealers report sales at 6.50 to 6.75 cents per pound f. o. b. New York for No. 1 domestic manila rope, and foreign manila rope is generally quoted at 6.25 to 6.50 cents ex dock at this port though paper mills are said to be reluctant to meet these figures on imported rope. Old bagging is quiet. Such buying as is being done is chiefly by roofing manufacturers, who are granting about 1.25 cents a pound f. o. b. New York. Quotations f. o. b. this city are:

Gunny No. 1	1.50 @ 1.60	Wool Tares, heavy	1.50 @ 1.60
Foreign	1.40 @ 1.50	For. Manila Rope	6.25 @ 6.50
Wool Tares, light	1.20 @ 1.40	Domestic Rope	6.50 @ 6.75
Wool Tares, heavy ...	1.40 @ 1.60	Mixed Strings	1.25 @ 1.50
Roofing Bagging	1.25 @ 1.35		

Old Paper

A quieter situation exists in old paper. Demand from consuming sources is much smaller in volume than it was a few days ago, and those buyers who are operating in the market are offering lower prices and seem to be securing the supplies wanted at reduced rates. Mixed paper of No. 1 grade is reported selling at 60 cents a hundred pounds f. o. b. New York, and there have been reports of lower prices than this prevailing. Folded newspapers are available at 80 cents a hundred pounds New York, common mixed paper at 50 cents, box board chips at 75 cents, and bogus mill wrappers at 90 cents. Shavings are quoted at last prices but the tendency is downward, and old magazines have eased off to 1.40 cents a pound f. o. b. New York for heavy flat stock. White blank news cuttings are down to 2.15 cents a pound New York. Quotations f. o. b. New York are as follows:

No. 1 Hard White Shavings	3.75 @ 4.00	Ledger Stock	1.85 @ 2.00
No. 2 Hard White Shavings	3.25 @ 3.50	Kraft, No. 1	2.25 @ 2.35

Box Board Chips	.75 @ .80	New Manila Env. Cuttings	2.75 @ 3.00
No. 1 Colored Shavings	1.60 @ 1.75	Bogus & Mill Wrappers	.90 @ .95
Magazine flat stock .	1.40 @ 1.60	News, strictly overissue	1.10 @ 1.20
No. 1 Crumpled	1.25 @ 1.35	Folded News	.80 @ .90
Solid Ledger Books ..	2.00 @ 2.15	No. 1 Mixed Papers ..	.60 @ .65
		White Blank News ...	2.15 @ 2.25
		Common Paper	.50 @ .55

Twines

Business in twines is still mainly of routine character and is marked by no feature. Buyers are coming into view only when pressed by necessity to absorb supplies and even then are resorting to a good deal of "shopping" before placing orders. However, the firmness of raw materials serves to sustain prices and quotations display little change at about the following ranges:

Sisal Hay, pure	12.25 @ 13.25	Jute Wrapping twine, A grade	20.00 @
Manila Hay, pure	16.25 @ 17.25	Papermakers Twine ...	11.50 @
Sisal Lath Yarn	12.25 @ 13.25	B. C. Hemp, 18	.39 @ .40
Manila Rope, pure, ¾ inch diameter ...	14.25 @ 15.25	B. C. Hemp, 24	.38 @ .39
Hardware Rope	11.25 @ 12.25	B. C. Hemp, 36	.37 @ .38
Jute rope, ¼ diam. and over, coils	14.00 @ 15.00	America Light India— No. 6	14.50 @
Sail twine, A grade ...	20.00 @	No. 7	13.50 @

Chemicals

There is a fair demand for most papermaking chemicals and no important changes are noted in quoted prices. Casein is priced at 13 to 15 cents per pound, bleaching powder at around 1.60 cents, caustic soda at 3.10 to 3.20 cents, and soda ash at 1.40 cents.

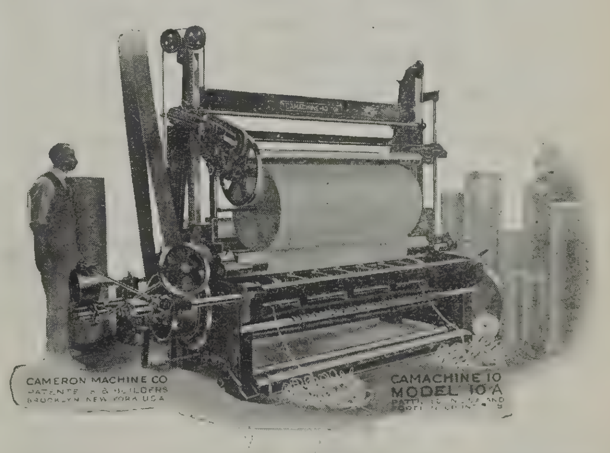
UNIVERSAL



Of universal application to the needs of wholesale paper warehouses, paper dealers, paper converting plants and paper mill finishing rooms is CAMACHINE Universal Type 10 Model 10A, illustrated here. This machine is built in widths 42", 52", 62", 72" and 82" and will wind rolls to a maximum diameter of 36". Descriptive literature covering this and others of the complete line of Camachines, which cover every roll requirement, will be sent on request.

TO SHOW VARIOUS USES OF GLASSINE PAPERS

Westfield River Paper Company Will Have Unique Exhibit Among Many Others To Be Shown

An exhibit of glassine paper showing the many uses to which this practically transparent form of paper is put, will be the feature of one of the exhibits at the Second Paper Industries Exposition to be held at the Grand Central Palace, New York City, during Paper Week, beginning April 7th, at the time of the conventions of the American Paper and Pulp, National Paper Trade and affiliated associations.

The Westfield River Paper Company is working out this exhibit, which will show both plain and embossed glassine papers, together with two specialties, celloglas and silver-coated paper glas. The variety of uses for such papers will be shown in an unusual form in this exhibit.

A novel display of paper cans and paper milk bottles and similar paper vessels will be made by the Purity Paper Vessels Company of Baltimore, together with appliances for the ice cream and other branches of industry handling food products. Allyn G. Whitehead, supervisor of sales in the Eastern district will be in charge, and he will be assisted by John A. Owen, Jr., and William A. Palmer, supervisor of sales in the Metropolitan district, while W. R. Lenderking, vice president and general manager will be in attendance throughout the Exposition.

The Sealright Company of Fulton, N. Y., will have an exhibit of its complete line of paper cans for liquid and semi-liquid moist foods, paper milk bottles and paper milk bottle caps. Dr. Wilbur L. Wright, president of the company, will have personal charge of this exhibit, and special letters are being sent to all concerns handling this company's products, inviting them to be the guests of the company at the Exposition.

Another exhibitor has arranged for a special exhibit by loan from the United States Forest Service laboratory at Madison, Wis., which will show the progress of a log through the pulp and paper mill to the finished sheet. This will be done by means of photographs, together with wood in the rough and chip form, with bottles of pulp, chemicals and sheets of the finished papers. A series of framed pictures will show the development of papermaking from the earliest times, as a display of particular historical interest.

In the machinery and equipment section there will also be most interesting exhibits. The Potdevin Machine Company will have in operation pasting, gumming and glueing machinery for edge, strip and solid surface covering of paper cardboard cloth and similar materials in chests. There will also be in operation a two-color printing flat and square glassine paper bag machine and postage stamp bags will be distributed at the rate of 100,000 daily, made from a roll of paper in the company's booth.

The Mayer Coating Machines Company will have exhibits showing its machines for coating of paper with clay and other special solutions, together with asphalt coating and duplexing machines.

The Armstrong Machine Works will have in operation a glass model of a steam trap working under steam pressure and A. E. Armstrong the company's president will be in attendance to explain the use of these traps as applied to paper machines.

The Cameron Machine Company will have in operation three machines for the production of small, medium and large rolls of paper and paper boxes. The exhibit will show the company's entire line of winders with other equipment made by this company.

Among the other equipment exhibits will be those of the Locke Regulator Company, Westinghouse Electric & Manufacturing Company, Reed Air Filter Company, Booth Chemical Company and the Faatz Manufacturing Company. The latter company's exhibit will consist of power savers, while the evolution in belting practice will be shown by F. L. Smith & Company.

The space available for exhibits is rapidly being taken up, and by the time the Exposition is opened it is probable that there will not be a booth unsold.

EXHIBITS FAST COMING IN FOR GRAPHIC ARTS

Switzerland Company Takes Space in the Milwaukee Graphic Arts Exposition

RUDOLPH FRETZ of Fretz Brothers, Zurich, Switzerland, who is in America studying the latest development of printing and lithographing has expressed much interest in the Graphic Arts Exposition to be held in Milwaukee, August 18 to 23, and has written his firm for authority to take space.

"There was a lack of development in the graphic arts industries in Europe during the war and as a result the American firms spurted ahead of us," said Mr. Fretz. "Especially in the offset process have you progressed further than we and it is to catch up that I have come to this country to work in various plants and learn what is being done.

"I have observed several outstanding differences in the manner in which establishments are conducted here and in Switzerland, and the rest of Europe. You are a country of specialists. In Europe the craftsman learns every phase of his process and is able to perform almost any equally well. As Herbert Hoover expressed it to me our development is on a horizontal line and yours on a vertical. The same thing holds good in plant management. In Europe the owner knows not only of the business and practical end of managing the firm but he also knows the technical side. In this country there are heads of many firms who are not technicians."

Mr. Fretz declared that in the last two years the advertising business has increased in Europe as the result of the American influence. American ads have appeared in the press, and American visitors have told of the value of advertising. Europe lacks capital, however, and its firms are not as large as those of this country, so advertising is not on as great a scale.

Business in the printing and lithographing lines was dull the first part of the war, then picked up, only to slump again on account of the amazing fluctuations in the exchange rates. Switzerland was especially hard hit because her exchange remained high while that of other countries sank lower and lower, making trade with Switzerland expensive. The year 1923 was the worst experienced but now business has picked up, according to Mr. Fretz.

He expressed confidence that many European firms would be represented at the exposition and convention of the International Association of Printing House Craftsmen because of the opportunity of seeing under one roof all the latest developments in the industry in America.

"The exposition presents a wonderful opportunity for European firms to see your latest machines and processes with a minimum of effort," said Mr. Fretz.

The number of foreign diplomats and firms which have replied to invitations to be represented at the exposition has increased from 100 to 150. Many have stated they will send representatives while others are considering the matter.

H. & D. Bischoff of Munich, Germany, is one of the foreign firms which has taken space at the exposition. This firm specialized in fine reproductions of oil paintings.

Mr. Fretz is at present employed by the Gugler Lithographing Company of Milwaukee. He spent several weeks in New York and one year in Paris. He has spent approximately two years in his study tour thus far.

Top-Heavy With Borrowed Money

American business is gradually becoming top-heavy with borrowed money, says a Financier, who is an observer.

Industry is acquiring altogether too many creditors and too few partners. It is financing itself in a troublesome degree by the sale of bonds and notes with but indifferent success at the sale of ownership participation in the form of stock, says *The Paper Dealer.*

That there is something radically wrong in the public attitude which necessitates this sort of financing is indicated by the fact that share certificates of American industry are far more valuable on any basis of comparison than ever before.

In general, he says, the average business should not be financed by a capital structure that consists of more than 50 per cent borrowed money. The percentage that has prevailed during the last ten years shows but a negligible amount of stock. In other words, this country is borrowing against the future to finance its present needs. Unless a decidedly different trend is achieved in the not distant future refinancing and collection day will become a serious problem.

The securities of dozens of important industrials are selling today in the open market for less than the actual cash in excess of dividends added to surplus since 1914. The stock of a long list of companies is selling for less in the market than the total of cash in banks and liquid securities owned by those companies.

GOOD PAPER —GOOD RESULTS

The effectiveness and pulling power of Direct Mail literature depends entirely on the proper selection of Paper. The finest illustrations possible or the best copy cannot get your message across if produced on paper that cannot stand the strain.

FRANKFOLD Enamel

a paper built for a purpose, will answer the requirements unusually well. The extra long, firmly knitted fibres assure good folding qualities and a required sturdiness. The beautiful and uniformly smooth surface will faithfully reproduce the sharp details of mechanical subjects or the subtle shades of color work.

FRANKFOLD ENAMEL preserves that freshness and inviting appeal so essential to successful direct-mail literature.

We will gladly forward some printed specimens or blank sheets for dummy purposes.

The Franklin Coated Paper Company
Franklin, Ohio
Eastern Sales Office:
110 E. 42nd Street New York City

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not only by what you put into the equipment but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged anywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

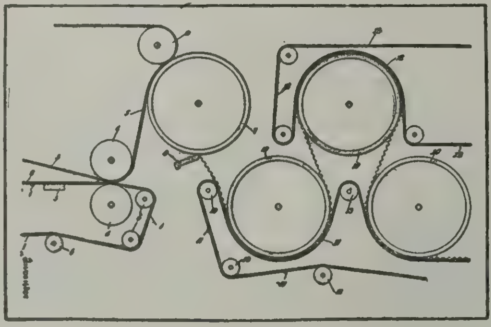
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shetting less lint than cold creped paper products.

JUST OFF THE PRESS

PULPWOOD AND WOOD PULP IN NORTH AMERICA

By Royal S. Kellogg

Author of "Lumber and Its Uses," "The Cost of Growing Timber," "The Timber of the United States"

270 Pages 87 Illustrations

A graphic presentation of one of the vital economic problems of the day—the securing of an adequate supply of paper.

This book is of special interest to everyone connected with the pulp and paper industry and equally so to all users of print paper. It points out clearly what must be done to develop sufficiently our supply of pulpwoods.

Lands for plants, fronting **deep water for deep sea** loading. Millions more cords of wood available very cheap. A clear stream of fresh water free for washing pulp. Address Box 245, care of PAPER, 1478 Broadway, New York City.

FOR SALE

Beaters—One N & W 48x48 rolls, 21″-6″. Two iron tub rolls 52″x40″.

Bed Plates—Large lot, all sizes. New.

Calenders—One 7 roll 72″; one 9 roll 72″; one 5 roll 78″; one 7 roll open side 84″. One 7 roll 124″.

Calender Rolls—Large assortment, all sizes; one 14x86″; one 18x84″; one 18x100″ and many others.

Coaters—One 45″ Waldron, double coater, and others.

Cutters—One 38″ Guillotine.

Cylinder Moulds—One 36″72″; one 30″x52″; one 12″x22″.

Drives—One No. 1 Reeves Class E; two No. 3 Reeves Class E, 4 to 1; one No. 3 Class E; one No. 6 Large Reeves; one No. 10 Reeves, F-3 to 1 with extra disc.

Dryers—48x116.

Exhausters—One Sturtevant.

Fans—3 Hunberry; 2 Perkins.

Jordans—One N & W Monarch, with new shell two Horne; two Emerson, large size, one base; one N & W Pony, with extra plug.

Pulleys—One 98″x34″ face, double arm, modern, Iron pulleys; Cone pulleys for Marshall Drives.

Pumps—One dry suction Knowles 12x22x18; one 1000 gal. Blake Tank pump; two Lawrence Mch. Co.'s Class A 8″ high duty; two 6″ Emerson make; one 4″ Centrifugal; one Type 4 Gould 5″ triplex, self contained. Two Lawrence Machine Co.'s Class A, No. 4, double suction pump for high elevation or for low speed. Thoroughly rebuilt and ready for shipment.

Press Rolls—One pair new, one RC 18x80″; one Gun metal 18x81″; one 16x75″; one RC 15½x73½″.

Rag Cutters—Two No. 2 Daniels; one Perkins.

Screens—4-8 pl. New Success.

Slitters—One 86″ P & J.

Winders—One 86″ P & J; one 100″ P & J; one 112″ M & W.

Wet Machines—One N & W with cut offs, mould 30x52″; two spare moulds.

One set Dillion Doctors for 80″ calender rolls.

MILLS MACHINE COMPANY
Lawrence. Mass., U. S. A.

THE CLEARING HOUSE—Continued

MISCELLANEOUS

WANTED—A second hand 80 or 84 inch Fourdrinier paper machine in good condition. In reply state full particulars and price. Address Box 1284, care of PAPER.

Representation is solicited of responsible mill which seeks to sell paper or pulp in this country. Considerable experience and success enjoyed in the industry. Age 34; university training and well connected. Will share expense of a trip to home office of mill interested in interview. Address Box 1289, care of PAPER.

SALES AGENT with ten years' experience in paper mills and several years' selling experience, having steady outlook for considerable straw, chip and test jute, container board tonnage, desires to represent mills on commission basis in metropolitan district; highest references. Address Box 1286, care of PAPER.

TECHNOLOGIST in stained paper field, about 30 years' practical experience, specialist in paper, cardboard and paper board fields. Can furnish formulae. Solve manufacturing difficulties and install new improvements, particularly in the following fields—glazed paper, chromo papers, art printing papers, stained paper, marbled paper, carbon paper, waxed paper, etc. Can secure all materials as well as machines. Regular technical advice given.

WILHELM REINICKE,
34 Melanchthonstr.,
Crimmitschau i.Sa., Germany

GOVERNMENT BIDS

Treasury Department,, Bureau of Engraving and Printing, Washington, D. C., March 1, 1924. Sealed proposals are invited to furnish Dextrine, Oils, Textiles, Dry Colors, Paper Boxes, Paper and Check Paper, during the fiscal year beginning July 1, 1924. The right is reserved to reject any or all bids or parts of bids. Samples of Dextrine, Oils, Textiles and Dry Colors must be received at the Bureau of Engraving and Printing not later than 2 P.M., Wednesday April 9, 1924. Samples of Paper Box Blanks, Paper and Check Paper, must be received not later than 2 P.M. Monday, April 7, 1924. Blank forms with specifications for proposals, giving dates on which the bids for the several schedules will be opened, and further information will be furnished on application to Paul E. Twyman, Assistant Director.

New Type Elevator

The accompanying illustration shows a new type of elevator designed to solve the problem of handling loaded trucks, wheelbarrows, etc., from one elevation to another, in places where the common freight elevator would not be practical.

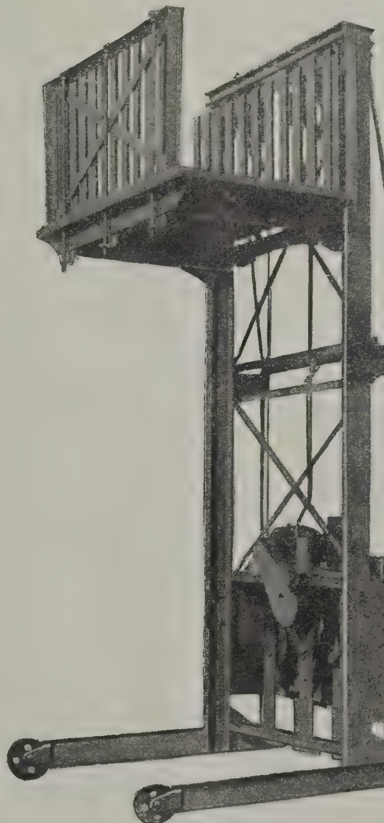
It is especially suitable for serving elevated charging platforms of foundry cupolas, gas generators, grinding, mixing machines, hoppers, etc., for serving mezzanine floors, between two floors, from floor to box cars and between different floors levels.

It may be used for portable or fixed position work.

Standard capacities range from 1000 to 6000 lbs., and platform sizes from 3'—6" to 6'x10'.

Its novelty lies in the following points:

A unit elevator with large platform requiring no support from the building.



A large platform that remains level under the eccentric loading of moving trucks.

An electric control that automatically stops the platform at the high and low points.

An electric brake that stops the platform at a set level regardless of wear.

Control from high or low levels or from platform.

A control that stops the motor and sets the brake from low voltage, failure of current or loose wire.

No mechanical adjustments for safe operation.

No instructions or mechanical knowledge necessary to operate.

The machine is built by New Jersey Foundry & Machine Co., 90 West Street, New York City.

MEETING OF KRAFT BY PRODUCTS ASSN

Interesting Gathering of Members Held in Chicago Recently

A MEETING of the Kraft By Products Association was held in Chicago, Illinois, on Friday, March 8th at the Old Colony Club.

The following members were in attendance:

Mr. O. Bache-Wiig representing Wausau Sulphate Fibre Co.; Mr. E. G. Goodell representing Stevens Point Pulp & Paper Co.; Mr. G. W. Forrester representing Minnesota & Ontario Paper Co.; Mr. J. H. Delbridge representing Falls Manufacturing Co.; Mr. B. T. McBain representing Nekoosa Edwards Paper Co.; Prof. A. H. H. White, Consulting Engineer of the University of Michigan.

Professor White made a report on the laboratory work done to date on his proposed method of recalcinating lime and reclaiming chemicals in one operation, and it is very probable that within a short time the reclamation of by-products in the connection with the production of kraft pulp will be an important factor.

After final figures and data is collected one of these plants will no doubt be erected at one of the above Company's plants for use in the recalcining and reclaiming of lime.

Much interest is centered on the installation of such a plant which will allow the reclaiming of valuable by-products now lost to the industry.

B. T. McBain of the Nekoosa Edwards Paper Company, is Chairman of this association, and John E. Alexander of the same company is Secretary and Treasurer.

A Few Stray Thoughts

SPRING, with its exuberance, is here. It is here on the calendar and in actuality, judging from the weather during the last few days.

With it comes hope springing eternal—and annual conventions. The fag end of March is now with us. April is already preparing for its grand entree. It totes along with it what is expected to be one of the livest and biggest annual conventions of the American Paper and Pulp Association that has even seen the light of day.

The rush of activity at the Association headquarters in 41st Street, New York, is a criterion that the convention is going to be something unusual, both in scope and interest. While it is not known how many speakers will "point with pride" and "view with alarm" at the various gatherings of the big week, it is certain that those selfsame addresses will take on a brilliancy not customary. One reason is that foreign competition is causing a dangerous situation. Another is that because business is not so good, drastic remedies will be suggested. Still another reason is that an exceptional group of orators are on the programs.

There is only one place for a mill official or executive the week of April 7, and that is at the convention.

* * *

The impression has arisen that because the paper industry of America is beginning to take cognizance of the fact that quantities of paper are coming into this country under misclassification or in violation of the Anti-Dumping law, the industry is criticizing the administration of the customs in the United States.

Such is not the case at all. The paper industry of America has the greatest respect for the customs officials, but as PAPER stated last week, these officials are only appraisers and are not detectives. They are doing their work well. The paper industry only wants to work with them—not against them.

* * *

The oil situation continues to ooze over everything. Business doesn't know where the next splash will fall. Finances, the delicate pulse of the country, scarcely knows how to beat. The uncertainty of the outcome is clogging the wheels of progress. And the paper business suffers with the general debility.

* * *

The annual number of the *Pulp and Paper Magazine of Canada* is a splendid piece of work. It contains some 240 pages and is both typographically excellent, and is textually valuable. It is profusely illustrated, the faces of many of the men who are responsible for the vast growth of the Canadian pulp and paper industry, appearing in halftone. The advertising pages contain many color ads, some concerns taking many pages to tell their comprehensive story. PAPER offers its congratulations to Mr. J. N. Stephenson.

* * *

Which is a gentle reminder that PAPER itself is going to have a Convention Number that will be worth while. We are putting special effort on it to make it something that will be examined time after time doing the year, which will be attractive industrially, technically, ethically and graphically.

By all means have your advertisement in that issue. For almost everybody else will.

* * *

And, don't forget to come around and see us at the convention.

Bacteria That Dissolves Paper

An Account of Certain Fresh-Water Micro-Organisms That Cause Rusty Water And Spoil Pulp in the Beater

By WM. H. GESELL

At the March meeting of the Society of Chemical Industry, held at the Chemist's Club, New York, the accompanying paper attracted considerable attention. Imagine the development in the reserve water supply of a mill making bread wrappers of a species of bacteria that abstracts iron from the water and grows upon it. Magnified, the iron bacterium resembles a tall narrow vase filled with marbles. The outer sheath, of a mucilaginous substance, secretes the iron. Frequently papermakers are surprised by the appearance on the machine of a brown sludge which ruins that run of paper. It is noticed usually when a change is made in the weight of the paper or when a sudden increased demand is made on the water supply.

My discussion this evening will be about one of the most common substances used in a chemical plant and incidentally one which happens to be the world's most common substance. It is water, and although I am sure that what I shall tell you will not be new to many of you, I am sure it will be of interest, seeing that so many of the difficulties in paper mills and chemical plants are caused by impurities in the water.

Quite frequently when I have heard my friends discussing difficulties they have had in their respective plants, such difficulties as impure products, dirty chemicals, spoiled textiles in bleacheries, dirty spots on the paper in paper mills, I have mentioned the experiences I had some years ago. My experience seemed so new to them that I felt a few minutes discussion on this subject would be interesting.

Iron Bacteria

I refer to the capacity of most classes of fresh water micro-organisms of abstracting iron from water, and collecting it in the form of ferric hydroxide on their surfaces. Certain protozoa, algae and htread fungi have this property. It is also characteristic of certain representatives of each class of bcteria and in these cases the phenomenon is very marked because the bacteria not only collect the iron very rapidly but have an excellent structure for storing the ultimate product — ferric hydroxide — in the mucilaginous sheaths which surround their bodies. This deposition is often so great that it exceeds the volume of organism itself. This class of iron itself. This class of iron bacteria exhibits a higher phase of development than is met with in the vast majority of bacteria; they lead a communal life and for that reason multiply very rapidly.

First Experience a Puzzling One

My first experience with them was a most puzzling one. We had a deep well the water of which was used for the drinking fountains in our plant. It had a receiver with an opening on top and so arranged that the excess water would run back into the well. Quite frequently the water would become rusty and a few days later a distinct butyric-acid-like odor would be noticed. Examination revealed iron bacteria. We realized that these iron bacteria were wind-borne and by covering the receiver and repiping so that the overflow did not go back into the well, we soon overcame this difficulty. The rusty water was the accumulation of ferric hydroxide in the membranes of the bacteria and the odor was the decomposition of the sheath.

Sudden Appearance on Paper Machine

I have experienced this same type of thing in bleacheries where the water is rich in organic matter; in plants where the water is obtained from a mountain stream; and particularly in a paper mill. Quite frequently our reservoir woud become brown in a day. Often after carefully bleaching and washing the pulp it would suddenly spoil in the beaters and the discharge water be brown although the reservoir was colorless. Or very often sudden rushes of brown sludge appeared on the paper machine, particularly when the weight of paper was changed or when a sudden demand was made on the water supply.

Bacteria to Blame, Not Corrosion

Many chemists and engineers blame rusty water on corrosion in the pipe or even electrolytic reactions. But invariably on color examination, except in boiler feed water conditions, we found these rusty waters to be caused by iron bacteria.

As I have said before some iron bacteria can change the character of the water in twenty-four hours, that is over Sunday; others multiply in attachment to iron pipes and so accelerate the formation of incrustation as to necessitate the installation of new pipes. Particularly common varieties are:

Common Varieties Water Bacteria

1—Leptothrix Ochracea.

2—Crenothrix polyspora is dreaded on account of the suddenness of its attack. It will take up manganese as readily as iron.

Crenothrix polyspora is the one which produces the offensive odor.

Achieves a Calamity Growth

on occasions this organism achieves a calamity growth when multiplication is so rapid that its results are visible to the naked eye in the form of a transformation of the normal color of the water into a reddish brown. One sees countless specks which are coated and permeated with a ferruginous compound. Growth is greatest in April, in the open, but will occur in a plant and in pipe lines, whenever temperature and conditions conducive to its growth are present.

These bacteria multiply rapidly. If a single thread produces 100 reproductive cells in twenty-four hours, and if they all germinate this process continues unchecked.

In 1 day we have 10_2 filaments.
In 2 days we have 10_4 filaments.
In 4 days we have 10^{1}_{6} filaments.

Other less common ones are:

Cladothrix Dichotoma
Clonothrix Fusca
Gallionella ferruginea

How They Grow

All iron bacteria will remain alive in water until desiccated. The minimum and maximum temperatures of their growth are respectively 5° C., 23° to 25° C., 40° C. They grow in darkness or in diffused daylight. They grow better the greater the amount of oxygen in solution. They all have a mucilaginous sheath which will adhere anywhere and which is an excellent apparatus for retaining the iron.

These bacteria are usually present in waters containing organic matter and of an acid character due to the presence of carbonic acid. Such acid waters usually have iron in solution. There is a further assumption that the organic matter may cotain iron. In the iron waters the organic matter is absorbed and digested by the iron bacteria and is held in the sheath and oxidized to ferric hydroxide.

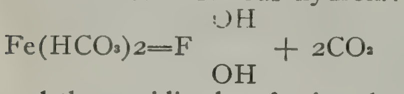
The reactions which occur may be considered as follows:

$Fe + H.OH + CO_2 = FeCO_3 + H_2$

and absorbs more $CO^2$and the Ferrous Carb. is changed to bicarb:

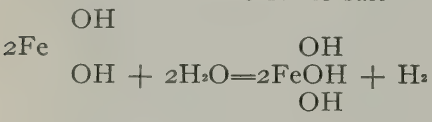
$FeCO_3 + HOH + CO_2 =$
$Fe(H.CO_3)2$

then bicarb. to ferrous hydrox.:



$$Fe(HCO_3)2 = F\begin{matrix}OH\\ \\OH\end{matrix} + 2CO_2$$

and then oxidized to ferric salt



$$2Fe\begin{matrix}OH\\ \\OH\end{matrix} + 2H_2O = 2Fe\begin{matrix}OH\\OH\\OH\end{matrix} + H_2$$

How to Remove the Trouble

Various remedies are available—carbon dioxide is prevented from going into solution or is rendered inactive by the addition of the bicarbonates of lime, magnesia, or copper. Maintaining an alkaline reaction of the water wiss prevent consequent calcareous deposition in the pipes, also acids. And of course the removal or organic matter will starve the bacteria and remove the trouble.

Bacteria That Absorb Other Metals

Might I add one other thing which has nothing to do with iron bacteria. There is a group of zygnemaceae which absorb aluminum, iron and chromium. There is also a group, and in this same paper mill where we encountered so many difficulties in the water, we managed to produce a particularly tinny sheet of paper owing to the presence of organisms which had the power of binding silicates.

* * *

New England Steady

The New England market shows steadiness in chemical pulps but there was a sharp decline in domestic mechanical pulp with quotations dropping as low as $28 f.o.b. mill. Cheaper pulpwood, lighter demand, and satisfactory operating conditions throughout New England are reported. Foreign chemical pulps remain unchanged.

Boston pulp interests are at present actively engaged in a controversy with the Shipping Board over the Board's removal of Boston as an entry port for the steamers from Scandinavian ports in the woodpulp trade. There are at present 100,000 tons of chemical and mechanical woodpulp booked for shipment via Boston from Norway alone and over 100,000 tons of pulp came to Boston last year from Scandinavian points, with approximately half that amount to Portland, Me.

* * *

New Mill Completed

The new mill for the manufacture of tissue paper which has been in the course of construction at Yaleville, north of Norwood, by the Martin Pulp and Paper Company since the fall of 1922, is practically completed, and the first machine installed started up for a try out last week with favorable results.

The plant consists of a beater room 31x72, machine room 132x60, boiler room 30x48, and coal pit 30x20 feet. The basement is 12½ feet high and the machine room 20 feet. 300 tons of steel were used in the construction.

The mill is equipped with two 1,000 pound Horne beaters, a Noble & Wood jordan and a 94 inch single cylinder B. & S. tissue machine. The machine is speeded to manufacture 425 feet of tissue per minute, which will mean about five tons of nine pound tissue every 24 hours. The power is directly connected twin cylinder variable speed engine, connected to two boilers of 150 horse power each.

The proprietors of the mill are the Martin Brothers, sons of the late O. E. Martin of Norwood, and well known in Potsdam.

THIS WEEK'S WINNER

W. G. DAVIS,

Delmar, N. Y.

What A Difference

At the English Stationers' Social Society dinner held last month in London, one of the speakers told this story, which may strike a responsive chord in some of our own paper salesmen:—

"One evening in a well-known commercial hotel in the Midlands a paper man sat down to dinner apparently well satisfied with himself. He first sampled an appetizer, then went through the whole course including soup, fish, meat, sweets and cheese. Then he indulged in a bottle of wine, followed by coffee and a good cigar. Opposite him sat a modest gentleman who ordered buttered toast and coffee. The prosperous man turned to his table companion and said, 'I suppose you are on special diet, old man.' The moderate diner replied weakly, 'No, only on commission.' "

Eaton & Dikeman Report

The balance sheet of the Eaton & Dikeman Co., of Lee, Mass., as submitted to the corporation department, shows a total of $444,893. The company has a capital of $90,000, a surplus of $127,272, machinery listed at $114,237, real estate at $81,993, merchandise at $205,380 and accounts receivable at $25,887.

* * *

To Build Pulp Mill

The Farlinger Company of Sioux Lookout, Ont., will build a pulp mill in the near future, and eventually add a paper mill. Engineers are already at work to develop the required water power on the English River. The company is capitalized at $2,500,000.

* * *

With Allan Company

Thomas J. Boddy, formerly of the Buntin Reid Paper Company, Toronto, and a well known paper salesman, has joined the staff of the Allan Paper Company, Simcoe Street, Toronto, and will take the place of the late C. W. Price as city traveller.

DECLINE IN PULP IMPORT REPORTED

Receipts 26.5 Per Cent Less in Januar Than in January, 1923

IMPORTS of wood pulp and other pap base stocks into the United States du ing January, 1924, declined 26.5 per cen in volume and 20 per cent in value com pared with the same month last year, a cording to Commerce Department figure

The greatest decreases were in receip of bleached sulphite, which dropped 30 p cent in quantity and 33.5 per cent in valu and of unbleached sulphite which showe a loss of 21.8 per cent in quantity and 12 per cent in value. Of the chemical pulp imports of unbleached sulphate (kraf show the smallest loss, receipts durin January amounting to 19,124 tons, value at $1,152,551, a decline of only 12 per cen in quantity and 10 per cent in value com pared with January, 1923. Imports bleached sulphate were almost negligib amounting to only 88 tons, valued at $5, 774, a loss of approximately 95 per cen compared with last year.

Imports of mechanical groundwood f off 45.6 per cent in quantity and 31.5 p cent in value, while imports of rags we approximately the same as last year, an imports of old rope and similar stock sho a decrease of 13 per cent in volume.

Canadian Exports During 1923

Exports of paper and board from Ca ada during the calendar year 1923, we valued at $93,770,957, an increase of $16, 945,064, or 25 per cent over the previou year. During the same period 875,35 tons of wood pulp, valued at $47,027,49 were shipped abroad, an increase of 7 p cent in quantity and 14.6 per cent in valu compared with 1922. The most importan gains were registered in exports of news print to the United States, which exceede those of 1922 by $20,966,939, and also i exports of wood pulp and paper board t the United States, and of book, bond, writ ing, and wrapping papers to Australi New Zealand, and Japan.

Modern Methods Shown

A recent issue of the Sunday Oregonian Portland, Oregon, devotes a full page t photographic views taken by H. M. Brow at Youngs River Falls camp of the Crown Willamette Paper Company, twenty mile south of Astoria, Oregon. It shows th modern methods utilized by the big pape company in its logging work at this cam

There are eight of the views. Two show the log-loading with the use of moder tackle and a donkey engine; one toppin a spar tree preliminary to attaching tackl to it; two pictures show the use of a skyline in logging operations; one gives a panoramic view of the logging operations with the logging camp in the foreground; and there are two views of log-loaded cars one of these is of a trainload of logs and the other is of one mighty log containing 11,680 feet on a flatcar. Two men shown in this last picture appear like Lilliputian men when compared with the Oregon giant log by which one of the men is standing.

* * *

A Rare Bid

The Municipal Council, Haverhill, Mass., in opening six bids for the collection of waste paper throughout the city found a most singular announcement by one Albert Robertson, who agreed to pay $25 more than the highest bidder and an additional $2,000 for the contract. The other five bids for the privilege ranged from $105 to $1,500. The Municipal Council will authorize the collection of waste paper from householders by contract.

NEWSPRINT DEMAND IS HOLDING UP WELL

Monthly Summary of News Print Service Bureau Has Favorable Report

THE newsprint situation continues favorable. The demand is steady, and shipments are well up to production, is the sense of the report of the February newsprint statistics by the News Print Service Bureau.

The report says:

All Companies Reporting

The 46 United States companies reporting produced 117,322 tons and shipped 115,427 tons, the 20 Canadian companies produced 111,664 tons and shipped 109,901 tons, making a total production of 228,986 tons and shipments of 225,328 tons in both countries. These companies also produced 1,226 tons of hanging, of which 406 tons were made in Canada. Production exceeded shipments in United States by 1,895 tons and in Canada by 1,763 tons. Stocks at the end of February totaled 30,288 tons in the United States and 18,195 tons in Canada, a combined total of 48,483 tons which is equivalent to 5.1 days' average production.

Comparative Reports

Comparing production of 55 identical companies during the first two months of 1924 with that of the same period of 1923 the United States companies show an increase of 4,244 tons or 2 per cent., the Canadian companies an increase of 30,516 tons or 16 per cent. and the total of all these companies shows an increase of 34,760 tons or 8 per cent.

The average daily production of newsprint paper by these 55 companies reporting for February amounted to 92.9 per cent. of the average daily output during the three months of greatest production in 1923, with allowances for changes in machines.

* * *

Paper and the Newspaper

The Denver *Post* does publish a very large edition every Sunday, and a good sized edition every week day. Many other newspapers do likewise, but not many go into the details as concerns the paper feature.

Here is what the editor of the post says:

"Twenty-five acres of green forest were required to make the 125 tons, or 50 acres of newsprint used in printing our Sunday edition. It took 1,750 man hours of labor, 875 tons of steam and 145,000 kilo-watt hours of electrical energy to unroll that forest, converting a twelve foot log into a half-mile sheet of paper every three minutes. It took fifty years to grow the trees which, in the form of paper, shot through the mammoth presses of the *Post* in a few hours.

Not so many hundred years ago this marvelous transition of a tree into a newspaper, telling what all the world is doing, would have been looked upon as sorcery or some kind of black magic. The human brain has changed as much since those dark ages as a tree changes in becoming a newspaper. You may wonder if twenty-five acres of forest is not an extravagant price to pay for even one great newspaper. Statisticians figure all the wood used for the paper industry is only 4 per cent of the total cut and only one nineteenth of that consumed by forest fires. In 1923, more cords of wood were cut for firewood than the paper and pulp industry has used in the last fifty years.

The trees consumed by forest fires are lost. That benefits nobody. The trees used for newspapers are an educational force unequaled by any other in the world. What buys education is never wasted. Ignorance is the real extravagance.

The reforestation work which is being carried on in Colorado continuously is similar to that which is being done by the big paper mills. They have an eye to the future. One of the largest mills is planting 5,000,000 trees annually. Another never cuts the mother conifer,—the trees from which the seeds come."

* * *

BAKER GIVES ADVICE TO MASSACHUSETTS

Says State Could Use Forest Land To Raise Revenue

HOW Massachusetts could use its forest lands to meet the high and increasing cost of government was pointed out before the Kiwanis Club today by Dr. Hugh P. Beker, executive secretary of the American Paper and Pulp Association.

"Massachusetts state taxes have increased," he said, "from $7,988,000 in 1919 to $18,513,000 in 1922. The cost of government increased from $17,052,000 in 1913 to $42,967,000 in 1922, and the total per capita tax, federal, state and local is now $124.41. On the other hand, the state has 3,000,000 acres of forest land, only a little of which is actually producing trees. And yet this area, if devoted to the production of timber—the same timber which once provided the raw material needed by the state for building and industrial use, could once again supply the state in large part with the timber it needs, and save the great cost of transportation of the lumber now brought in from the south and the Pacific states.

"Out of a total land area in the state of 5,321,000 acres, only 908,000 are under the plough, and the state owns only 65,000 of the 3,000,000 acres of forest land. By developing its forests Massachusetts could bring back its wood using industries, and woodworking communities, provide more permanent springs and streams and thereby have fewer floods and droughts, have more fish and game, give the people forest playgrounds, utilize the now idle acres for financial profit, and thereby help build up the agricultural industry.

"Here in Springfield is the great fine paper manufacturing district—with Holyoke the greatest center of fine paper manufacturing in the world. More than 95 per cent of all the paper produced in this country is made entirely or in part from wood. By restoring the pine and hardwood forests it would be possible eo relieve the drain on northern New England and New York, so that those states could provide the fir and spruce needed by the paper mills. The paper mills are often charged with devastating the forests, yet they use only 4 per cent of the total wood cut of the country. As a matter of fact, the paper industry is today doing more than any other wood using industry to promote forestry."

* * *

Forest Changes Name

What was Battlement national forest, located on the western slope of the divide around Grand Junction, Colorado, has been renamed by a proclamation signed by President Coolidge. The new name is derived from a great natural geographic feature, the mesa, which is visible for miles around that section, hence Grand Mesa national forest.

The Grand Mesa forest covers 659,863 acres, the section abounding being a wonderful fruit raising country. Water from 125 lakes is used for irrigation.

MORE WOODPULP CONSUMED IN 1923

Report from Identical Mills to the Government Shows a Splendid Increase

THE Department of Commerce announces that according to preliminary statistics compiled by the Bureau of the Census, acting in co-operation with the Forest Service, United States Department of Agriculture, the total quantity of pulpwood consumed by 127 mills was 3,247,165 cords in 1923 as against 3,033,543 cords by the same mills in 1922. The production of woodpulp by these mills in 1923 amounted to 2,079,772 tons as against 1,883,827 tons in 1922. These plants consumed more than 54 per cent of the total quantity of pulpwood used in 1922 and produced nearly the same per cent of the total quantity of pulp.

In this comparative statement, which covers nearly one half of the total number of active mills, 20 states are represented. The returns indicate that the total figures for 1923 of consumption of pulpwood will exceed those of 1922 by about 7 per cent, predicating a total consumption of approximately 5,940,000 cords of wood, providing the percentage of increase holds true for the mills which have not reported.

Figures for 1923 are preliminary and subject to change if necessary.

Comparative statement of 127 identical mills follows:

	1923	1922
Cords of pulpwood consumed	3,247,165	3,033,543
Tons of woodpulp produced	3,079,772	1,883,827

* * *

Compare Glue and Casein

A preliminary printing test was recently carried out at the Government Printing Office on glue-bound papers as compared with those bound with casein. No printing difficulties of any kind were encountered, the glue-bound papers giving as good results as the casein-bound ones. The test indicated that no modification of ink is necessary for printing glue-bound papers, and that the adhesive quality of the glue is satisfactory. It is planned to make more extensive printing tests after the coating process has been further improved.

Ten additional machine runs were made during the month in order to obtain more information concerning the selection of paperstock and clay as well as the elimination of foaming of the coating mixture, which causes pinholes. Some progress was made in connection with laboratory tests to determine the waterproof quality of the coating.

* * *

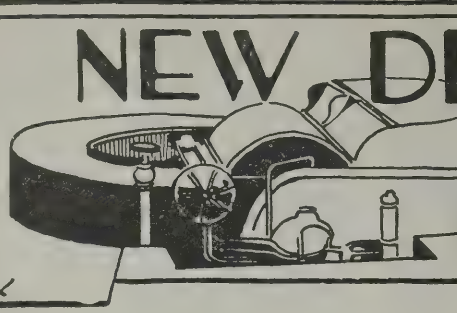
To Manufacture Paper

The Blake & Higgins Company, a new organization, has been issued a charter of incorporation in Vermont and will locate at Brattleboro, Vt., and operate in Windham County. The company will manufacture paper and kindred articles. The new company has a capitalization of $300,000, of which $100,000 will be preferred stock and $200,000 common. The incorporators are Herbert G. Barber, Frank E. Barber and C. Menzies Miller, all of Brattleboro.

* * *

New Firm Started

The Bay State Scrap Iron & Paper Company, recently organized to deal in paper stock, is located at 175 Marion Street, East Boston, Mass.



NEW DEVELOPMENTS IN PAPERMAKING

Determination of Lignin in Wood

In Cellulosechemie, volume 4, pages 109 to 113, there is contained a critical examination of the Schmidt and Graumann method of determining the percentage of lignin in wood. It is shown that this method in which chlorine dioxide is employed is inaccurate. It is shown that the aqueous solution of chlorine dioxide does not attack albuminous matters, so that in addition to mineral substances (about 0.2 percent.), the so-called "skeleton-substance" contains wood protein (about 0.8 percent.), an error of one percent. in the determination of carbohydrates being therefore possible. A more important error is also possible, since wood gum, containing xylose, mannose and chiefly dextrose, may be removed from the skeleton-substance by the treatment described by Schmidt and Graumann.

* * *

Beating Engine

An interesting improvement in the design of beaters, which consists essentially in the transverse sub-division of the bedplate into sections of one or more bars, is patented in British Patent No. 208,371, the details of which are seen in the accompanying illusrtations.

In the ordinary beater the pulp is circulated over the top of the bed plate and the beater roll in one continuous mass, to be ultimately discharged by the bars of the roller into the trough.

However in the improved design of beater the bedplate is divided into groups or sections of one or more bars each and the pulp is circulated through the spaces between the bars or groups of bars of the bed-plate. This arrangement ensures that each bar or group of bars in the bed-plate is supplied with pulp for beating, so that the pulp supply is efficiently and more uniformly distributed to the several bars of the bed-plate.

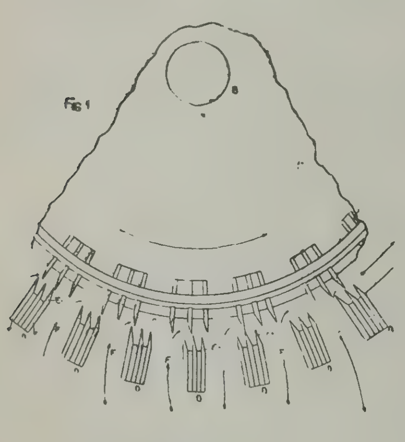


Fig 1

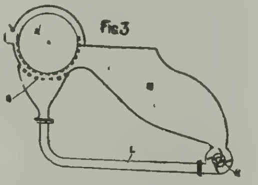

Fig 3

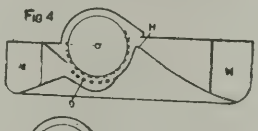

Fig 4

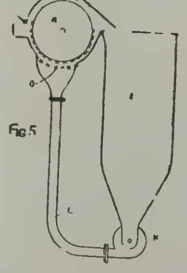

Fig 5

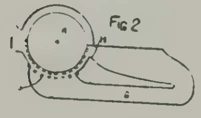

Fig 2

The beater roll may be fixed or adjusted to and from the bedplate in the known manner and the trough may be of any suitable shape. The beater roll preferably delivers the pulp over a curved guide to the trough which may have a slightly sloping bottom towards the back of the bed-plates, so as to facilitate the circulation of the pulp.

By the use of a pump system of circulation the bars or groups of bars may be situated in any position on the periphery of the roll, that is to say either below or above the roll or in any intermediate position.

Figure 1 shows the detail of a sub-divided beater bed-plate while the other figures 2, 3, 4 and 5 show the application of this type of beater roll to various styles of beaters.

In figures 1 A is the usual beater roll, B the shaft and C the bars of the beater roll which act in conjunction with the bed-plate. The bed-plate is divided itno seven sects of bars D, each consisting of three bars E. Any number of bars may be used in a group. There is a gap F between each set of bars. The bars are tapered at their inner edges at E. This system of bars extends all around the circumference of the beater roll. The flow of pulp is indicated by the arrows.

In figure 2 the beater roll is seen applied to a beater in which the pulp is contained in the trough G, circulated up through the bed-plate D and discharged by the bars of the beater roll A over a guide H which divides the trough G. In figure 3 the pulp is shown circulateh by the pump K through the pipe L and up through the bed-plate D, returning throuyh the trough M. Figure 4 shows a hollander with an annular trough N, the bed-plate D being disposed just below the level of the pulp in the trough N, to which the pulp after passing through the bed-plate D is returned, the pulp being discharged over the guide H by the oars of the heater roll A.

* * *

Drying Cylinders

In British Patent No. 208,732 there is described an improved arrangement of the draining bucket of drying machines that are internally heated by steam. The object is to provide a means for carrying off the water of condensation through one of the hollow trunnions of the cylinder. The improved bucket is cast integral with the end of the cylinder. In a modified construction of the bucket, the discharge ends of the pipes which collect the water do not cross the axial line of the trunnion as heretofore, but stop short of it to allow for a partition plate arranged longitudinally to the axial chamber and in line with the axis of the trunnion.

The water is picked up by each end of the bucket as the cylinder revolves and is directed into one of the pipes and discharged into the central chamber and then out through the hollow trunnion. The other discharge pipe is at this time in line with the upper part of the bore of the trunnion so that no water can return from it to the cylinder. The same conditions occur when the positions of both pipes are reversed. In a modified construction the pipe ends terminate a little distance short of the axis of the cylinder, and leave space to allow the water to escape on to the partition and out through the trunnion.

* * *

Making Copying Paper

Five parts by weight of a potash soap are neutralized with concentrated acetic acid. Then there are added two parts by weight of glycerine, 26 degrees Be, and to this there are also added one part by weight of melted grape sugar and a half a part by weight of potassium bichromate. When the surface of the paper is coated with a thin coating of this very difficulty volatile mass, a very effective copying paper is secured. The paper which may be made in any thickness suitable to the purpose to which it is going to be put can be manufactured in the translucent condition by varying the ingredients that are used in making it or else it may be rendered transparent with the aid of oil. The process is patented in German patent No. 388,103.

* * *

Improved Hair Felt

The improved hair felt, patented in British Patent No. 208,610, has a warp and a cotton weft. It is so woven that the hair is on the surface and carries the pulp. The felt is far more durable than one composed of cotton, which is soon destroyed by the deleterious matter in the pulp.

Substitutes for China Clay

Claims for Superiority of California Talc over Canadian Talc Considered by Author of Article on Uses of Canadian Talc in Papermaking—Question of Fineness of Product is One of Grinding, He Says

THE reproduction in Paper for January 31, 1924, of a dissertation by William C. Lodge on the use of Canadian talc for papermaking, which was presented by him at the annual convention of the Technical Section of the Canadian Pulp and Paper Association in Montreal, has attracted the interested attention of several producers of American clay and talcs.

From the foothills of the Sierra Nevada rangs of mountains, leading to far-famed Mt. Whitney, we have received a communication in which the writer asserts the superiority of the talcs mined there to those of Canadian origin. This was brought to the attention of Mr. Lodge, who has been good enough to comment as follows:

"At the time I wrote the paper published in Paper for January 31, I was interested in talc as a substitute for china clay, in view of the fact that we are producing talc in Canada, while all the china clay is imported.

"With reference to your correspondent's claim that the California talc is finer than the Canadian article, I think it is entirely a question of grinding. I believe that Canadian talc is produced in as fine grades as anywhere in the world. In fact, the bulk of it, as the present time, goes to the United States. I believe that reference to my paper will make this point sufficiently clear.

"For the purpose of our tests we used different grades of talc, using the coarest grade that was suitable for the purpose we had in hand. For instance, with blotters we used a talc giving a residue of 4% on a 200-mesh sieve. On the other hand, in newsprint and fine papers, the talc used carried less than 1% residue. In connection with the residue itself, this consists entirely of unground talc particles and not

"So far as the respective merits of Canadian and California talc is concerned I do not, at this writing, feel qualified to give any opinion. Naturally every manufacturer claims that the article he makes is the best on the market, bar none. Offhand I should say that there would be very little to choose between them. As I have stated above, Canadian talc can be ground, and is ground, to any degree of fineness desired.

"It would seem to me that it would help the talc producers generally if the advantage of talc *per se* were emphasized rather than emphasizing the relative merits and demerits of the different brands. Rightly or wrongly a great many of the paper manufacturers entertain strong prejudice against the use of talc at all and it would be well to get some line on the reasons behind these opinions and if possible, overcome their objections."

It will be of great interest to paper manufacturers generally to know that a talc is obtainable in California such as is adapted for use in papermaking. The talc mined in Eastern Canada and in Northern New York must be of quite a different geological formation. We have accordingly asked our California correspondent to send particulars of the varieties of talc that are mined in California, together with an account of their chracteristics, chemical constitution, grit, color, etc. It is hoped that this will reach us in time for publication in the Annual Convention Number of Paper, to which Mr. Lodge has promised to contribute an article on the talclays of Canada.

Notes of the New York Trade

Owen Sheperd, treasurer of the International Paper Company, has been elected treasurer, a director and a member of the finance committee of the Continental Paper and Bag Mills, succeeding Chester W. Lyman, who resigned.

* * *

L. B. Steward, formerly secretary and treasurer of the American Paper and Pulp Association, and widely known in the paper trade, has been appointed general manager of the Bayless Manufacturing Corporation, paper manufacturers with mills in Austin, Pa., and offices in New York City.

* * *

James Rosenberg, formerly president of the American Woodpulp Corporation, of 347 Madison avenue, New York, which firm recently filed schedules in bankruptcy, is now associated with M. Gottesman & Company, Inc., wood pulp importers of 18 East Forty-first street, New York.

* * *

Fred Enders, of Bulkey, Dunton & Company, wood pulp and paper importers and dealers of 75 Duane street, New York, sailed on the steamship Olympic March 22 for a several months' business trip to Europe. Mr. Enders will visit Scandinavia and other countries in Europe. During his absence V. R. Hann has charge of the wood pulp department of Bulkley, Dunton & Company.

* * *

The Bishop Paper Company, jobbers of 541 Pearl street, New York, has announced that J. W. Haraux, long known to the paper trade as an executive, is now associated with that company as an officer and director.

* * *

F. H. Luning, dealer in paper mill supplies of 436 Canal street, New York, will move on or about April 1 to new quarters at 592 Smith street, Brooklyn. The building Mr. Luning is now occupying is required for necessary construction work on the new vehicle tunnel connecting New York and Jersey City under the Hudson River. Mr. Luning's new location in Brooklyn will provide increased facilities for storing, grading and packing paper makers' supplies.

* * *

David Sternhardt, Burn Budd and Stuart Eaton have been appointed trustees of the American Corporation, of 347 Madison avenue, New York, under a joint bond of $10,000. The corporation has filed a schedule in bankruptcy, placing its liabilities at $221,774 and its assets at $321,587, the main items being notes $122,557, accounts $110,497, stocks $31,412, and insurance $39,512. There is a fairly large number of creditors named, most of whom are banks.

* * *

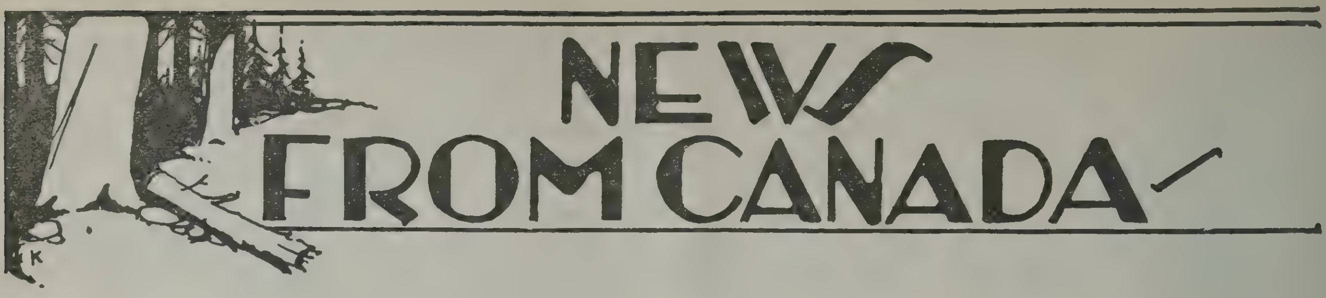
The partnership between George R. Kelsey, Raymond E. Risden and Robert S. Cooper, carrying on a paper jobbing business under the name of Kelsey, Risden & Cooper at 156 West Broadway, New York, has been dissolved by mutual consent. Mr. Cooper has sold his shares in the business to Messrs. Kelsey and Risden, who will continue same.

* * *

The Specialty Paper & Twine Corporation was incorporated several days ago under New York State laws to conduct a jobbing business in New York City in paper and twine with a capital of $10,000. The incorporators were I. H. Smith, C. J. Pintel and I. Schlanger.

* * *

The Wilson Paper Stock Company, one of the largest packers of waste paper in New York City with officers and warehouse at 452 West Nineteenth street, has taken over the five-story building at 228 West Houston street. The building adds about 16,000 square feet of floor space to the present facilities of the concern, which was obliged to secure more warehouse room because of its rapidly growing business.



NEWS FROM CANADA

CANADA TO STAND OUT IN BRITISH EMPIRE EXPOSITION

Model Groundwood Pulp Mill Will be One of the Features of the Exhibit This Year

CANADA'S pulp and paper exhibit at the British Empire Exhibition, which is to be held in London next summer will not only be unique, but one of the most striking features of a really great show. In the Natural Resources display there will be a model groundwood pulp mill with the forest background, a running river with a waterfall, a boom of logs, with the mill, townsite, railway sidings and wharfs. In the industrial exhibits of the Canadian pavilion the largest single exhibit will be that of the pulp and paper industry, which will occupy 1,000 square feet. It consists of five booths, each of which is divided into two showcases. The expenses in connection with the exhibit are being borne by 29 Canadian firms.

Those exhibiting or cooperating in it are: Howard Smith Paper Mills, Limited, Montreal; Barber Ellis, Limited, Toronto; Price Brothers & Co., Limited, Quebec; Laurentide Company, Limited, Grand Mere, Que.; Brompton Pulp and Paper Company, Limited, East Angus, Quebec; Abitibi Power & Paper Company, Limited, Montreal; J. R. Booth, Ottawa; Donnacona Paper Company, Donnacona, Que.; E. B. Eddy Company, Limited, Hull; St. Lawrence Paper Mills, Limited, Three Rivers; Spanish River Pulp and Paper Mills, Limited, Sault Ste Marie; Powell River Company, Limited; Belgo-Canadian Paper Company, Limited, Shawinigan Falls; Interlake Tissue Mills, Limited, Toronto; Provincial Paper Mills, Limited, Toronto; Canada Paper Company, Ltd., Windsor Mills, Que.; McLeod Pulp and Paper Company, Limited, Liverpool, N. S.; Gulf Pulp and Paper Company, Limited, Quebec; Riordon Company, Limited, Montreal; Spruce Falls Company, Limited, Kapiskasing, Ont.; Canadian Paper Board Company, Limited, Montreal; Dominion Envelope and Carton, Limited, Toronto; Wayagamack Pulp and Paper Company, Limited, Three Rivers; Industrial and Educational Publishing Company, Limited, Gardenvale, Quebec; Canadian Vegetable Parchment Company, Limited, St. Catherines; Garden City Paper Mills, St. Catherines, Ont.

The Newsprint department has received special attention. Among other things a collection has been made of papers printed on Canadian newsprint, which will be displayed in suitable form, together with a sign giving some information respecting the size and growth of the industry. The increase in production will be set forth by a row of rolls of standard newsprint of various heights and contributed by some of the exhibitors. There will also be a display of newsprint in the Natural Resources exhibit. This will consist of one roll of paper 18 feet long which will require a searchlight playing on the top of it in order to show its extreme length as it stands on end. Around this will be arranged three rolls 12 feet in length, these representing the widest and fastest machine in operation anywhere. There will also be other rolls showing the normal size of the newsprint roll as it reaches the publisher.

Tissue paper manufactured products will be attractively displayed. There will also be exhibits of towels, tablecloths, and other novelties. This branch is becoming an important one in the Canadian papermaking industry. A joint exhibit of pulp, paperboard and other wood fiber products will be another very fine feature. A series of graduated lengths of pulpwood sticks will show the increase in consumption of pulpwood by Canadian mills; a series of rolls of bleached sulphite will also show the increase in the production of sulphite fiber. Products of a new industry in Canada, that is from cellulose silk manufactured from pulp, will also be shown.

One of the exhibits representing the manufacture of envelopes and like products will show a distant mountain and lake scene with forests in the middle foreground, also a pulp and paper mill, a box factory and a line of automobiles carrying the products to the steamer.

A huge map of Canada six by nine feet will show with numbered buttons each of a color representing the kind of pulp and paper made, the location of Canada's pulp and paper mills, also the location of projected enterprises. Photographs of a number of plants will be shown. There will be fine exhibits of Canada's high grade papers, and a number of very excellent views of the Forest Products Laboratories of Canada.

* * *

Increase Water Storage

The Powell River Lumber Company, Powell River, B. C., preparatory to increasing their manufacturing facilities and turning out more newsprint, have completed plans for increasing the height of the water storage dam at the outlet of Powell River to give more extensive water storage in Powell Lake and make possible a consequent increase in the amount of electrical energy that will be required when additional papermaking machines are installed. The dam will be raised about another fifteen feet and the work is to cost in the neighborhood of $200,000. The project has been passed by the board of directors and arrangements are now being made to award the contract. It is expected that work will start early in April.

ORGANIZER DISAPPEARED WITH FUNDS

This Is What Is Alleged to Have Happened in Canada, According to Story Getting Through

CONSIDERABLE excitement has been aroused by the demand of the labor officials headed by Tom Moore, president of the Canadian Trades and Labor Congress, that an investigation be made of the statements that an organizer of the International Pulp and Sulphite Workers, decamped with nearly a thousand dollars belonging to pulp and paper workers. Some of the labor men have taken offense at the charge made by P. J. Veniet, premier of New Brunswick, that such an organizer disappeared with the funds collected from the employes of pulp and paper mills. He stated he was at one of the meetings and knew of this matter personally. He said the organizer came to Bathurst and attempted to organize employes of the Bathurst Company, pulp and paper manufacturers. A meeting was called for and about seventeen hundred attended. The organizer spoke for an hour and a half and collected a fee of fifteen dollars from each of the men desirous of joining the union. The organizer then went out a rear door of the theatre in which the meeting was held and vanished with the money.

The labor officials deny that any labor organizer disappeared with the funds. They claim the money was expended properly. Mr. Veniet insists that the men who paid the fees did not receive the value of their money. He also claimed that some of the subscribers paid less than others because the organizer reduced his fee from fifteen dollars to much less in order to secure all the money available. In order to combat the charge made against the official organization of pulp and paper workers a representative of the organization is at present in eastern Canada demanding an inquiry into the charges. He has made a categorical denial to all the charges and emphatically denies that money was collected by an organizer who subsequently disappeared with the money. He declares the charges have been made with the intention of injuring the union, and expresses his intention of bringing suit if necessary. The statements were made in hearings on the request of pulp and paper companies for reductions in compensation rates, it being stated that outside labor organizers mostly from the United States, were creating most of the trouble between labor and capital in the pulp and paper industry insofar as Canada was concerned.

* * *

New Paper Box Factory

The new paper box factory for Kilgour Brothers at Windsor Mills, Que., has started operations. This is a branch of a well known Toronto firm, but in future will be operated independently.

Discuss A Merger

At the annual meeting of the Provincial Paper Mills, Limited, in Toronto last week, the subject of the proposed merger between that company and the Howard Smith Paper Company was not up for discussion so it is presumed that the deal is off for the meanwhile at least. Following the meeting S. F. Duncan, secretary, stated that the matter of the purchase and installation of a second machine at the Port Arthur plant of the company had been endorsed by the directors who have left the matter in the hands of the executive of the concerns, but it was hardly considered likely that the new machine would be put in this year. The Board of directors was re-elected with the exception that R. S. Waldie, of Toronto, succeeds to the vacancy created by the death of C. A. Peck of Kalamazoo, Mich. I. H. Weldon is the president; T. A. Weldon, vice-president, S. F. Duncan, treasurer and W. S. Barber, secretary. Manufacturing profits for the year amounted to $493,333, as compared with $729,261 in 1922. Sundry revenue of $9,989 brought total income to $503,322, which, added to the surplus brought forward of $833,468, made $1,336,790 available. There is an increase of $80,000 in reserve for depreciation on buildings and plant and a reduction of $35,000 in dividend disbursements, accounted for by the fact that no bonus was paid during 1923. The balance sheet shows assets of about $500,000. Decrease in profits is attributed by President Weldon to the first six months of operation, in which profits from all the mills were low, due chiefly to manufacturing costs. During that period the new mill at Port Arthur, Ont., was completed and put in operation. Regarding the outlook President Weldon says: "I do not anticipate much change in the market for paper this year, but do believe that manufacturing conditions will be better."

* * *

Cut Up 11,000 Cords

The Porcupine Pulp & Lumber Co., Ltd., Hoyle, Ont., have cut up to date 11,400 cords of pulpwood, which has all been hauled, 3,500 cords direct to the mill at Hoyle, and the balance to various points along the Porcupine River. The company's total cut will be from 12,500 to 13,000 cords whereas last season they took out only 4,300 cords. The Cliff Paper Company of Niagara Falls, N. Y., to whom the company ships its wood after it is rossed, have provided storage space for 7,000 cords. Hence the company will load this amount, with chutes from the conveyor, as it is rossed directly onto cars for shipment to the T. & N. O. According to M. E. Crouch, the manager, the company will go ahead with the construction of a sawmill in the early fall, at the end of the rossing season. This will be a sawmill to start with of about 15,000 feet capacity per day. The company anticipates no difficulty in getting all the men they want for the coming drive and for rossing operations through the spring and summer.

* * *

Lumber Camps Break Up

The lumber camps in the Sault Ste Marie district, and in fact all over Algoma, are breaking up, causing a steady influx of men into the city of Sault Ste Marie, Ont. Most of the companies have finished most of their winter cutting and no fear is felt for low water preventing driving. The camp of the Spanish River Pulp and Paper Mills, Limited, however, is still going strong and will not break up for some time yet.

NO EARLY ACTION ON EMBARGO NOW

Nothing to Show That Canadian Government Will Act Hastily

THERE is nothing in the Canadian Government's legislative programme announced at the opening of Parliament to suggest early action on the proposed embargo of exports of pulp wood. For one thing, the Pulp Wood Commission has not completed its work, and until it does so and makes its report it will be impossible for the Government to announce any change in policy. The character of the programme inclines one strongly to the view that, in face of the strenuous opposition of settlers to the proposed embargo, the present Government will not introduce it. The Government is dependent on the support of the farmers and is quite unlikely to do anything to offend them. On the other hand the Ontario Government is about to introduce legislation providing for the placing of an export duty on exports of hard wood cut on Crown lands within the province. It is indicated that this will be tantamount to an embargo. The extent to which American interests have lately been drawing on these resources is one reason for such action, serious inroads having it is said, been made into available supplies. The success that has followed the placing of an embargo on exports of pulpwood cut on Crown lands in Ontario encourages the Government in its new policy. In doing what it is, the Government is not running up against settlers as it would be were the embargo placed on pulpwood exports.

* * *

To Get Together

Coincident with the announcement of the appointment of W. H. Kilby as Chief of Forest Protection of the Canadian National Railways is the extending by the railways of an invitation to Dominion and Provincial forestry officers and officers of forest protection associations to a meeting to be held in Montreal next week for the purpose of discussing and determining upon co-operative methods of forest protection and fire control between the National Railways and the forest organizations. The meeting, which is unique in transportation annals, since the invitation is issued by the railways to the forest officers, will bring together a large number of Canadian experts in silvaculture.

* * *

To Extend Property

The tendency for American pulp and paper companies to launch out in Canada is to be seen in the announcement that the Brown Corporation which operates an important sulphite pulp mill at La Tuque, Que., with a daily capacity of 320 tons, is contemplating extensions to its property that will permit of it turning out quite a much larger range of by-products. At present turpentine is being manufactured at La Tuque, and with the addition of other machinery it will be possible not only to manufacture it, but also chloroform, industrial alcohol, bi-sulphite of carbonate, caustic soda and bi-carbonate of soda. Most of these are made from the waste liquor drained out of the digester after the sulphite pulp is manufactured. There is also a possibility that fiber tubing may be manufactured. This is made by pressing groundwood pulp, mixed with waste liquor and tar, and provides a material that is not only insulated but waterproof. At present the Brown Corporation manufactures no paper in Canada, confines its efforts entirely to sulphite that is taken by its mills in the United States.

Improvements Completed

Within the next two or three weeks a number of extensive improvements that have been in progress at the Cornwall, Ont., plant of the Howard Smith Paper Company will have been completed. An addition to No. 3 and 4 machine room was put on which allow of the lengthening of the machines. A new machine shop has also been erected which is 120 feet long by 50 feet wide. The new finishing room is one of the most attractive and best arranged of any in Canada. It is 133 feet by 189 feet, three stories high and built of concrete cased with brick. This provides for taking the cars into the shipping room, the railway siding going right into the interior. At Gaspe the company will soon have completed their wood plant and will handle about 25,000 cords per year of wood from there and about 6,000,000 feet of lumber. All the conveyors and loaders are finished and a new wharf has been built. A new breakwater is also included in the work which is being carried out. The transportation of the wood will be done by boats which have been chartered for the coming season.

* * *

Mill Starts Again

The King Coating Division of the Allied Paper Mills, which has been down for several months has started up. Edward Coughlin former superintendent of the coating division at the Monarch Division of the Allied, is now superintendent at the King Division. Jacob Polderdyke formerly employed on the Coating machines at this division will be finishing room boss. Kelly Ingraham, who has been working at the Monarch Division, will go back to Kings as Coating room boss.

* * *

Snow Interferes

The recent heavy falls of snow have interfered seriously with the operations of logging and pulpwood companies in the bush and will add considerably to the cost of production. Thin ice has been a great inconvenience and a number of concerns have lost horses breaking through the ice and being drowned. There is a good demand for poplar pulpwood and large quantities are being moved along the C. N. R. from Renfrew west to various points in the United States.

* * *

Differences on River

Serious differences which have existed between the Abitibi Power and Paper Company and the Hollinger Mines regarding conflicting interests on the river, have been practically settled in Toronto at a conference attended by Noah Timmins and A. F. Brigham and the Minister of Lands and Forests. The Abitibi Company feared that the construction plans of the mining company would cause the site of their power lease to be flooded.

* * *

Change Name

It has been decided to change the name of the Thames Paper Company, Limited, of Purfleet, Essex, England, to Thames Board Mills, Limited.

This change is one of name only, and does not involve any alteration whatever in the constitution of the Company.

* * *

Northcliffe Shuts Down

The Northcliffe Paper Mill, Grand Falls, N. F., has been shut down as a result of a wage dispute. Workers in the mill claim they have been locked out by the management of the mill Some 800 men are affected.

All Aboard for Big Convention

Rush of Applications For Tickets For Annual Banquet of Paper and Pulp Association

JUDGING by the rush of applications for tickets for the annual banquet of the American Paper and Pulp Association, Thursday, April 10, the closing feature of the Forty-Seventh Annual Convention, the Paper Week slogan of "Business—not Politics," has struck a sympathetic note among the country's paper mills. Every indication is that the 1924 convention will strike a new high peak in association history.

Applications so far received are in excess of those received at the same time last year, and many of those asking for tickets are providing for a larger number of guests than they entertained a year ago.

Now that the banquet program is completed, the work of the Association staff is being devoted to the completion of the program for the forenoon session of Thursday. The discussion will be devoted to business conditions in the four great groups of the industry, the pulp, coarse and fine groups, and the situation among the paper board manufacturers. This latter is a new feature of the convention program for the board manufacturers, through their newly organized associations are working closely with the American Paper and Pulp Associations, and cooperating particularly in the gathering of production statistics.

In addition to these business reviews, there will be reports from the two companies which have been quietly spending several months of study upon affairs of the American Paper and Pulp Association, the committee on finance, and the committee which has been discussing the Association's program of activities for the coming year. Both of these reports will involve recommendations for important developments in Associations affairs, it is expected. Final meetings of the committees will be held before the convention date to formulate their recommendations.

There is every reason to believe that the Association's convention will mark an epoch in the affairs of the United States Paper Industry as represented in its association activities, and the appreciation of this is already evident in the volume of the demand for banquet reservations. It is possible that the high record of attendance at an Association banquet, of 1,200 reached in 1923 will be equalled.

Several conferences outside the ordinary program of convention week are being arranged. Not the least important of these is a special conference to be held Tuesday, forenoon, April 8, for the discussion by a group of leading manufacturers and merchants of the problem of simplification of paper sites. This is arranged by request of the Department of Commerce authorities who are working on this question, and follows a recent conference on the same subject at Washington, chiefly attended by the users of paper. The results of the Tuesday conference will be announced at the Thursday business session of the American Paper and Pulp Association.

Another interesting event of the week will be the meeting of waxed paper manufacturers Tuesday morning at which there will be discussed the need of a waxed paper manufacturers association to back up trade customs, handle complaints and improve credits, and the general development of the trade association work in the waxed paper industry. There has been strong sentiment expressed in favor of the reorganization of the waxed paper manufacturers, whose old association was dissolved several months ago.

The Association has just sen out a special announcement of the manner in which reduced railroad rates may be secured by those attending the various conventions being held during the week of April 7, and the rate has been secured also for those attending the Paper Industries Exposition.

An innovation in the banquet arrangements is being announced at the same time, in the issuance of complimentary tickets to families of those attending the banquet. These tickets will be for admission to the balconies after 9 P. M., for the evening's speaking program.

In general, the three days of convention will have as their main features the following in addition to the large number of meetings of the affiliated associations scheduled for 'Paper Week."

Tuesday April 8—Salesmen's Association annual meeting in the forenoon, dinner and smoker in the evening; meetings and annual banquet of the Technical Association of Pulp and Paper Industry; meetings of the National Paper Trade Association.

Wednesday, April 9—Woodlands Section Convention; Technical Association meetings; meetings of the National Paper Trade Association, with its annual dinner in the evening.

Thursday, April 10—American Paper and Pulp Association annual meeting in the forenoon, and the annual banquet in the evening meeting of Technical Association in afternoon at the Paper Industries Exposition.

As part of its general service to the industry the American Paper and Pulp Association is assisting in the holding of meetings of various groups not officially affiliated with it, such as the papermaker's advertising club, the bristol board manufacturers and other gorups.

A review of the program of Paper Week would not be complete without reference to the Second Paper Industries Exposition, held under the endorsement of the American Paper and Pulp Association at the Grand Central Palace. The Exposition opens Monday, and continues through Saturday, and its chief features are so arranged that the paper manufacturers will be able to attend without interference with the convention program, and the general public will be told of paper and how to buy the right paper for right uses during the entire week.

* * *

Tentative Outline of Program

Monday, April 7: Registration opens at the Waldorf-Astoria; committee meetings as arranged by the chairmen; smoker in the evening for junior members principally, at the Canadian Club.

Tuesday, April 8: 9:30 A. M., first business session, Waldorf-Astoria; 2:00 P. M., general technical session, Waldorf-Astoria; 7:00 P. M., annual dinner, Commodore Hotel.

Wednesday, April 9: 9:30 A. M., business session, election of officers, Waldorf-Astoria; 2:00 P. M., Sectional meetings.

Thursday, April 10: 9:30 A. M., technical sessions, Waldorf-Astoria; 11:00 A. M., American Paper and Pulp Association annual meeting; 2:00 P. M., Sessions at Grand Central Palace.

Friday, April 11: 9:30 A. M., meetings for unfinished business, Waldorf-Astoria.

* * *

Half Million Assets

The Newton Paper Co., of Holyoke, in its recent report filed with the state, shows total assets of $692,997. The company shows a capital of $72,000, accounts payable of $13,243; reserved for depreciation $233,523 and surplus of $374,231. Its real estate is listed at $224,584 and machinery at $292,587 and cash on hand of $91,627.

* * *

Announce New Paper

The West Virginia Pulp and Paper Company takes special pride in announcing Clear Spring Book Papers, because the company believes their use will usher in a new era for printers and publishers. Made in Super, English Finish and Text, these uncoated papers enable the printer to produce printed matter for illustrated and decorated work, and plain typography.

Supremely great human beings have al-had one quality in common—faith in themselves.

Through the Middle West

NEW MILL IS NEARING COMPLETION

Exterior Work of Riverside Fibre and Paper Company Progressing Well

EXTERIOR work for the new paper mill of the Riverside Fibre and Paper Company of Appleton has been practically completed, the last cement having been poured for what will be the stock building by C. R. Meyer and Sons' Company, the contractors.

The buildings are to be heated by the Ross system which utilizes the waste steam from the paper machines. The steam passes through "economizers" near the roof where it comes in contact with fresh air which it heats and is then conveyed to all parts of the buildings.

The new paper machine, manufactured by the Beloit Iron Works, has arrived and is being set up. It is 116 inches wide and is 200 feet in length. At least sixty days will be required to set up the machine and get it in operation. As soon as it is in operation the machine in the present mill on the canal bank on the West side of Lake street will be moved to the new structure.

Electric power will be used and two crews of electricians are installing the motors and switchboards. One of the elevators is in place and the other will be installed in about two weeks.

The finishing building and the machine building are two stories high and the stock building is of five stories. All of them are constructed of re-inforced concrete.

The gravity process will be used in handling the wet pulp from the pulp mill which means the pulp will be elevated to the upper story of the stock building and from there will find its way to the proper machine, doing away with the present laborious method of handling.

The new filtering plant on Lake street is completed and the filters, pumps, and piping are being installed. The plant is 30x240 feet in size and a 16 inch pipe connects it with the new mill. The plant has a capacity of three and one half million gallons.

The same contracting firm has just been awarded a contract for a new office building for the Riverside Company, to cost approximately $15,000. It will be located across the street from the new mill and work on it already has been started. It will be 32x55 feet in size, two stories high, and will be completed in sixty days. It will be of stucco and white cement. Only the first floor will be occupied at first. There will be a directors' room and six private offices, the latest office equipment being installed.

* * *

Short Newsy Items

The Tennessee Paper Co., of Chattanooga, Tenn., of which John Stagmaier is president, is installing two new 500 h. p. Heine boilers, equipped with Erie City coal pulverizing machinery, and has erected a self supporting steel smokestack, 8 feet by 185 feet and has put in two 500 k. w. direct connected generators.

The New Orleans Corrugated Box Co., Inc., New Orleans, La., has let contract for erection of $11,500 warehouse, in square of Oleander, Burdette and Lowerline streets.

C. Marshall Gravatt, Biltmore, N. C., is in the market for equipment for the manufacture of cardboard boxes.

Wisconsin Mill Notes

Joseph E. Hill, engineer of the plant of the Gilbert Paper Company of Menasha, and former Menasha mayor, suffered painful injuries in an accident, one of his feet being crushed.

The Knickerbocker Paper Company of Milwaukee, has been incorporated with capital stock of $25,000. Incorporators are A. Webster McGann, Joseph J. Gross and Guido J. Hansen.

Last week 185 cars of pulpwood were handled through the yards at Appleton Junction and it was estimated by railroad officials that nearly 500 additional cars arrived in the Fox River valley consigned to mills at Kimberly, Combined Locks, Little Chute and Kaukauna.

Foremen and superintendents of Appleton were interested auditors when members of the Lawrence college teams debated the Huber Unemployment Insurance plan at the Kimberly-Clark clubhouse.

S. F. Shattuck of the Kimberly-Clark Company explained "Industrial Relationship" to the Noon Lunch Club at Neenah. He discussed the operation and results obtained by the "shop committee" plan.

E. W. Young, formerly with the Kimberly-Clark Company at its Kimberly plant, has been promoted to general manager of the company's warehouses and will have his headquarters at Neenah. His activities in connection with the safety movement at Kimberly have been taken over by M. J. Ritten.

The Riverside Fibre and Paper Company had to use its hoist to fish a truck out of the canal where it lay completely under water. The motor truck, without a pilot, ran wild down the hill and into the canal.

* * *

A Booster Booklet

A neat little booklet recently was issued by the Kimberly-Clark Company entitled, "Niagara, Wisconsin—a Good Place to Live." In the booklet, which is of twenty-eight pages, there are pictures of the Niagara Club, the paper mills, foremen, views of public buildings, typical homes of workmen, camping scenes, the athletic club and the hospital. Under the direction of the Kimberly-Clark Company, Niagara is recognized as a model town in which to live and work and the booklet gives one a most favorable impression of the company's enterprise.

* * *

St. Patrick's Day Event

The green division of the Kimberly-Clark Company safety contest took advantage of St. Patrick's day to hold a safety rally at the Kimberly mill. Irish songs were sung and M. Carrigan gave a talk on Ireland. Six young women workers from the finishing room, clad in white middies, skirts trimmed with shamrocks and white hats, sang "My Irish Rose" and other Irish songs.

NORTHERN PAPER MILLS HAS WHITE RAPIDS

Rosebush Makes Statement Regarding the Change

SOMETHING of the vision of officials of the Northern Paper Mills, and perhaps just a glimpse of what the future holds for Green Bay as a paper manufacturing center, is contained in the announcement that the Northern has acquired the White Rapids power site on the Menominee river and will develop it and transmit the power to Green Bay for use in the manufacture of paper.

The site has been owned by the Northern Paper Mills for about three years since the purchase of the White Rapids company, of Oshkosh, at that time, and the transfer which brings it to the attention of the public is not news, but the plane for development have caused no little speculation, especially of late.

It is estimated that the White Rapids site will develop about 10,000 horsepower, and with the site there is included several miles of river front and a large acreage of flowage lands.

Judson G. Rosebush. treasurer and general manager of the company, confirmed the announcement from Menominee that the transfer had been recorded there.

"There is no plan to develop this property this year," he said. "Just what use will be made of the power has not yet been decided. However, it is planned to build a hydro-electric plant and to transmit the power to Green Bay."

The Northern PaperMills now use about 6,000 horsepower in their plant and whether the White Rapids power will be used exclusively for the Green Bay plant and others in the Fox River valley will probably be determined by conditions when the plans for the development are further along. The additional grinders installed at Green Bay could use the entire output, and while this was suggested as a possibility, Mr. Rosebush did not announce it as a certainty.

Surveys now being made of the property and figures on the cost of development are being prepared, but no definite announcement could be given except that it would not be made this year.

* * *

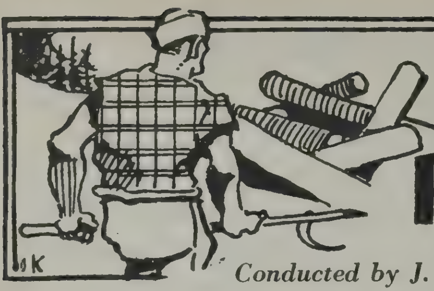
Shows Various Stages

Step by step the manufacture of paper is shown in a cabinet display received by the mechanical department of Marquette university college of journalism from the S. D. Warren Paper Company, Boston, and now on exhibit in the laboratory. Ingredients used in making paper are contained in labeled bottles which show every element needed, from the shipped bark and spruce to the chemicals. A representative of the Warren company recently appeared before the Marquette Press club and explained the papermaking industry in detail.

* * *

Injured in Mill

James Johnstone, a Peshtigo man employed in the Hoskins-Morainville paper mill at Menominee, Mich., was injured when his clothing caught in a set screw and he was drawn onto a revolving shaft. His injuries will not be fatal.



FORESTRY in the PAPER INDUSTRY

Conducted by J. R. Simmons, Secretary Forester, the New York State Forestry Association

FORMAL APPROVAL FOR McNARY-CLARKE FORESTRY BILL

National Chamber Backs Legislation As Step In Direction of Accomplishment

IN a letter to President Coolidge the Chamber of Commerce of the United States has given formal approval to the McNary-Clarke Forestry bill as a step in the direction of the adoption of a national forestry policy.

The measure, although much more limited in scope, is found to be in accord with the comprehensive policy, formulated by the National Chamber in a referendum submitted to its constituent members last November, which was strongly supported by the lumber interests throughout the country and which received a favorable vote.

The McNary-Clarke Forestry bill would provide that the Secretary of Agriculture, in cooperation with state officials or other agencies devise forest fire prevention systems the expense of which would be borne equally by state and the federal governments. The bill also would authorize the Secretary of Agriculture to make a study of tax laws applying to timber lands, methods and practices of forest perpetuation, and to investigate and promote protection of forests against fire, pests and tornadoes. Provision is also made for the encouragement of the development of wood lots and other forest growth by individual farmers, the distribution of seeds and the enlargement of National Forest areas by the inclusion of public lands best adapted to timber growing.

The forestry policy approved by the National Chamber calls for the acquiring by the federal and state governments of lands necessary for the protection of navigable headwaters, and replanting where necessary; the creation of competent agencies or commissions for forestry protection and development within the states; tax reform, improved practice in forest perpetuation; extension of fire prevention measures; a national survey and inventory of forest resources, and the extension of federal research in forest products.

The steps proposed in the Mc-Nary-Clarke bill are in line with these recommendations and it is believed that the investigation to be carried on by the Government, provision for which would be made under the terms of the bill would hasten the adoption of a national policy.

In his letter to the President, Elliot H. Goodwin, Resident Vice President of the National Chamber, calls attention to the referendum and the report of the committee upon which it was based,—composed of lumber manufacturers, users and foresters,—formulating principles for a national policy for meeting the nation's forest problem. It is pointed out that the McNary-Clarke bill is a step in the direction of its accomplishment.

The action of the Chamber is the result of the long investigation by its forestry committee of which Dr. Hugh P. Baker of the American Paper and Pulp Association was vice-chairman, so the action of the Chamber is in part result of the activity of the paper industry along forestry lines.

* * *

Meetings in Bay State

The Bay state heard the story of forestry from a variety of angles at the convention of the retail lumber dealers, who were told that the state could easily raise a large part of its timber requirements under proper working plans. It was shown that the state uses 900,000,000 feet of lumber per year, of which one third is in the building industry, and the balance in some twenty large industries which use wood as their major product.

Another talk a few days later by Dr. Hugh P. Baker of the American Paper & Pulp Association, who spoke before the Kiwanis Club at Springfield, pointed this statement before the lumbermen's convention by saying that the state has 3,000,000 acres of forest land now idle but capable of growing a crop of trees to restore the state's vanishing wood using industries. On the basis of as small a yield as 300 feet per acre from artificially grown trees, the state could produce the amount of lumber now used by its industries, in addition to the amount that is now being used from its scattered forest lands.

Dr. Baker pointed out in his address before this audience in the most important fine paper producing region in the world that Massachusetts does not naturally grow the trees most valuable for pulpwood, but that if pine could be produced in quantity, much strain would be released from the forests of the northern New England states. The growth in these states is largely spruce and fir, the most valuable of the pulpwoods.

* * *

Poplar For Reforestation

Among the many uses for Carolina poplar, not the least important is paper pulp. Unlike most of the forest trees, the Carolina poplar can be propagated from cuttings six to twelve inches in length which will make large trees.

The Conservation Commission in New York state has recently completed experiments which show that the best rooted cuttings are obtained from one-year-old growth, and that it is not economically profitable to undertake propagation of cuttings taken from wood of older growth. The one year wood rooted nearly 100 per cent in six weeks, many of the cuttings shoking shoots eighteen inches in length.

A RESOLUTION WELL RECEIVED

Forestry Men's Resolution Reaches Welcoming Hands

THE Forestry Association in New York State adopted a resolution on the McNary-Clarke legislation at its present annual meeting, and the Secretary was instructed to mail copies to the New York delegation, to Senator McNary and Congressman Clarke, and to the Chairmen of the committees. By return mail came acknowledgments from several of the legislators, including Senator Wadsworth, and Congressman Snell whose forestry bill of a year ago marks a step in the progress of the movement leading up to the present favorable situation. Fully half of the delegation has responded up to date, and it is announced that each and every response is favorable to the legislation.

It may be of interest here to state just what the resolution contained, for if there is any set form by which our representatives in Washington can be made to appreciate our viewpoint, we like to have a record of it for future reference. We lack the space to set down the encouraging responses mailed back by the senators and congressmen, but here is the resolution:

WHEREAS, the New York Forestry Association holds that it is not only desirable but necessary that our National forest policy be enlarged and extended, and for that reason has watched with great interest the work of the United States Senate Committee on Reforestation which has resulted in the introduction before Congress of a bill that embodies the steps, that, at this time, the Association feels are most needed for the advancement of forestry in the United States, therefore be it

Resolved, that the New York State Forestry Association heartily approves the provisions of the McNary Bill (S. 1182) now before the Committee on Agriculture and Forestry of the United States Senate, and of the Clarke Bill (H.R. 4830) now before the Committee on Agriculture of the House of Representatives, and urges their speedy enactment into law as a means of bringing about continuous forest production on all land chiefly suitable therefor, and be it further

Resolved, that copies of this resolution be forwarded to Senator McNary, Representative Clarke, the members of the New York delegation in Congress, and the Chairmen of the Committees before which these bills are pending.

* * *

An Interesting Experiment

A fairly definite answer to the question of where new tree growth on burned-over lands comes from, will be the result of present experiments in the Coeur d'Alene National Forest by the Forest Service, according to a recent announcement of that bureau of the United States Department of Agriculture. Experts from the Priest River Forest Experiment Station in Montana are conducting elaborate studies of areas burned over in 1910 and some reburned in the great fires of 1919 to determine the source of reproduction on both types of burn. This work involves a careful analysis of age, species, quantity and distribution of the young growth, in relation to the remaining seed trees and the character of the pre-fire forest. The information thus obtained will be of assistance to foresters and timberland owners in reclamation work.

* * *

Approaches Final Stages

By the time this article is in print there will be under way hearings on important forestry legislation in Washington and in Albany. A bill calling for regulation of timber cutting in the Adirondack area will be up for consideration in the Empire State, as well as the plan submitted by the technical foresters pursuant to the suggestion made them by the chairman of the committee on conservation. At about the same time there will be a hearing at Washington by the House Agricultural committee on the Clarke Bill, the House duplicate of the Senator McNary measure. The committee on agriculture has agreed to hold a hearing on this measure, and a determined effort will be made to have it recommended out of committee for passage, despite the difficulty Congress is having in doing anything constructive in legislation while the various investigations are under way.

* * *

Proclamations in Season

President Coolidge has set aside by presidential proclamation the week of April 21 to 27 as Forest Protection Week, with the request that schools, civic and other organizations plan such observance as will bring home to the public the need for preventing the disastrous fires in the woods, and the need of collective effort for conservation.

Governor Smith of New York is expected to issue his annual proclamation setting aside Conservation Week during the coming few days. It has been determined in advance to select the week of March 31 to April 8 for the observance this year. Most organizations will celebrate the week by undertaking some definite piece of forestry work. It has just been learned that several of the larger paper and pulp corporations in the east have adopted the plan of raising their own seedlings and transplants for reforestation purposes, thereby releasing more of the state department trees, which are sold at cost of production, for industries, private individuals and institutions.

* * *

Airplane in Ontario

In order to conserve Ontario's forest wealth and to protect the lumbering and paper industry, in which $75,000,000 is invested, the Ontario Government has purchased an airplane fleet consisting of thirteen machines to patrol the timber areas and detect fires in their incipient stages.

The planes are also to be used to make a survey of Ontario's forest wealth, with a view to checking up on the timber concessions and seeing that the Government is securing sufficient return from them, and also with a view to determining the amount of reforestation necessary.

During the past year, Hon. Mr. Lyons pointed out, fire has burned over 2,120,000 acres within the province, 28 per cent being timberland, 15 per cent cutover timberland, and 36 per cent young second growth.

NEWS AMONG EXPERIMENT STATIONS

This Branch Increases Usefulness To Paper Industry

FORTY Forest Service research specialists are spending two weeks in intensive discussion of forestry research plans for the future, with Chief Forester W. B. Greeley and Assistant Forester Earle H. Clapp in charge of research, as the leaders. The directors of the eight experiment stations, forest fire fighting specialists and the six western district foresters are among those in attendance, and the conference is particularly notable in that it is the first such gathering since 1917.

Technical problems in fire control, and particularly in the fire-weather prediction were the subjects which have first demanded the attention of the experts. The measuring of the moisture in forest fuels as a means of indicating the danger of fire was one of the technical discussions of the first week. The second week will be devoted particularly to the measures necessary to keep forest lands continuously producing timber. A study of this question made by special agents in all parts of the country will be reported, and may aid in the definition in specific terms of what is necessary in the way of forest fire prevention, and the methods of cutting needed to assure the natural regeneration of the forest.

* * *

Studying in Northern States

An interesting work on behalf of those interested in studying forestry work in the northeastern states is being done by S. T. Dana, director of the Northwestern Forest Experiment Station. He has begun the compilation of a list of places of interest for visiting foresters, and eventually hopes to prepare a map indicating the location of the places recommended for study. An interesting list of points of interest has been prepared for Maine, and the New York State Foresters are being asked to list the points which they believe would be of interest.

The Maine points of interest give surprising evidence of forestry work under way by paper companies, in the suggestion that visitors see the nursery of the Brown Company at Cupsuptic, the Orono Pulp and Paper plant at Mason Mills, the thirty acre plantation of the same company at Mt. Chase, Penobscot county, the hardwood utilization of the Oxford Paper Company at Rumford Falls, the nursery of the Lincoln Pulp Company at Trout Brook, as well as plantations and woods operations of various big paper and pulp companies.

Altogether there are twenty-one points of interest already listed in Maine alone.

* * *

Looking in the Future

Facts for the pulp and paper industry regarding red spruce in the Northeast will be secured from studies now being undertaken in Maine, and later to be extended to New Hampshire, New York, and possibly Vermont, by the United States Forest Service. This work, started last summer by the Northeastern Forest Experiment Station at Amherst, Mass., will be sufficiently comprehensive to make it possible to state the cut of spruce to be expected from a given tract 20, 30, and 40 years from now, or the exact amount of land necessary to supply any given mill with pulpwood permanently.

An obstacle to the work has appeared in the ravages of the spruce bud worm, which not only accounts for widespread destruction of timber but also has reduced growth rate through partial defoliation of the trees almost universally within the areas where it is found. A distortion of yield figures results which, although not by any means nullifying the present investigations, will make it necessary to establish at a later date permanent sample plots on which growth rates can be studied continuously from one cutting until the next harvest.

* * *

ENROLL FOR COURSE IN PULPMAKING

Operatives, Managers, Etc., Enroll for Government Course

EIGHTY-NINE pulp mill operatives, managers, foremen, and technical men from all over the United States have enrolled in the extension course in pulpmaking conducted by the U. S. Forest Products Laboratory in cooperation with the University of Wisconsin Extension Division. Dr. C. E. Curran of the pulp and paper section of the Forest Products Laboratory has charge of the course.

The students have a wide geographical distribution. Although 52 of them are from Wisconsin there are representatives from New York, Maine, Illinois, Mississippi, Minnesota, North Carolina, Michigan, Ohio, Washington, Indiana, Pennsylvania, Maryland, Oregon, Tennessee, and Mexico. Among the students enrolled are mill managers, superintendents, chemists, plant engineers and assistants, foremen, cooks, liquor makers, machine tenders, clerks and salesmen, and other representing practically every department in the pulp and paper mill.

The course is the outgrowth of an effort made some time ago by the Technical Association of the Pulp and Paper Industry and the Technical Section of the Canadian Pulp and Paper Association to improve American paper mill practice by the education of mill operatives. To this end a fund was raised for the writing of a standard textbook on American mill practice. Hitherto the majority of all textbooks available were based on European practice and problems. This new work is used as a text in the correspondence course.

* * *

The ninth annual convention of the Technical Association of the Pulp and Paper Industry will be held in New York at the Waldorf-Astoria and the Grand Central Palace, April 7 to 11, 1924. In an announcement mailed to members, W. G. MacNaughton, secretary, urges them make plans now to be in attendance at this convention at which there will be much of interest to everyone engaged in pulp and paper manufacture.

Besides the general sessions, at which papers on general subjects will be presented, there will be arranged sectional meetings on Paper Drying, Mechanical, Soda, and Sulphite Pulp, Paper Testing, Standard Methods of Testing Materials, and Cellulose. There will also be a joint meeting of the Technical Association and Woodlands Section at which a progress report on the utilization of decayed pulpwood will be presented by J. D. Rue and other members of the Forest Products Laboratory.

The management of the Paper Industries Exposition wishes to know if there is any special line of exhibit desired by the technical men in the industry. If members can suggest any they should let Mr. MacNaughton know at once or write to C. F. Roth, manager , Paper Industries Exposition, Grand Central Palace, New York, and efforts will be made to arrange for it.

Youth has exuberant vitality uncontrolled by wisdom, and therefore unappreciated. Age has wisdom unsupported by vitality, and therefore unappreciated.

The Editorial Page

Support the Wise Plan

AT the annual convention of the Salesman's Association of the American Paper and Pulp Association, Attorney Henry A. Wise will present his plan for an organized defense of the American paper industry from European competition. This defense will have as its principal weapon a strong, energetic, well-considered offense.

Because it is obviously impossible for the individual paper manufacturer of America to fight the business that is eating out the heart of the American paper industry at the present, the plan calls for the formal organization of a bureau or a committee to fight this battle. This committee would be forfeited with expert knowledge and expert legal advice. It would have for its business the gathering of facts and figures in all foreign countries regarding the cost of production, the cost of raw materials, labor, and everything that enters into the business of paper making. The price situation in those countries would also be examined into.

With this knowledge it would then watch imports as a hawk watches a chicken yard. It would see that there was no dumping violations, no misclassification or anything illegal.

At this time, the Wise plan appears to be the most practical solution of the problem of imports. Mr. Wise will explain this plan in an address at the Salesmen's Convention, on April 8. Action is expected to follow shortly, but this action will probably have to be the result of the entire American Paper and Pulp Association.

As it does not seem the most practical solution, the plan deserves the support of the members of the association. It will cost a little money to put it through, but the benefits derived will more than make up for the cost.

Unanimous support should be forthcoming when the time arrives.

The Need of Mergers

THE recent activity in almost all branches of paper manufacturing in amalgamating companies is only a result of the times. It is inevitable that there should be mergers.

When two companies making almost identically the same product find their market slipping from under them, when costs are mounting higher and the price of the finished product melting away, the natural tendency is to get together and see if there is not some way to conquer the situation.

It is found that money can be saved by a merger. The overhead is cut down, logging operations are combined, machines are kept more steadily on the same product. The financial arrangements are placed on a more solid foundation. And the market does not look so formidable with a combined company. So the two companies get together and a merger is the result.

In this land of the more or less free, there is a certain antipathy to mergers that smack of monoply. But there is no getting away from them from an economic and business standpoint. It is only by doing things on a big scale that a country can progress.

But, on the other hand, the larger and more powerful company must look upon the situation with a broader and more liberal mind. It should aim to benefit not injure its industry and its patrons. It must sometimes sacrifice profit for good will. It cannot make a god of Mammon. And therein lies the obstacle.

There is nothing so fine in a country as a beneficent trust, watching out for the interests of its country and its customers, with its costs cut to the bone, with its economic possibilities for service. When the beneficent monoply becomes a reality America will advance still more rapidly.

Until then it must look kindly on mergers.

Courtesy

SALESMEN frequently exclaim: "I prefer to do business with large companies. I am received more courteously. I see my man more promptly. I am treated more fairly."

Almost every business was once small.

Are courtesy, fairness, and promptness the ornaments of large businesses, like the polished door handles and bronze nameplates? Can't the small business man afford to be courteous, fair, and considerate? Or, is it possible that the proprietors of small businesses, who have these qualities, grow into big business men?

I am amused by the pictures Fontaine Fox draws of the Toonerville trolley. All of us are familiar with "Toonerville trolleys"—little businesses that are so slip-shod in their methods that only a sense of humor keeps the customers from murdering the proprietors, writes William Feather.

Rubber Latex in Papermaking

New Developments Point to Use of Rubber in the Making of Boards and Leather and Linoleum Substitutes

By T. J. KEENAN

Papermakers in all countries are following with keen interest the new developments in the use of rubber latex as a strengthening ingredient for paper. The accompanying account of the nature of the substance and its possibilities as an addition to the furnish in the beater presents a summary of the subject in its scientific and practical aspects that will be of suggestive value. The idea of vulcanizing the rubber while it is incorporated with the paper offers striking possibilities.

IT is little more than a year since it was first proposed to make use of the fresh milky sap of the rubber tree (*Hevea Braziliensis*) in the manufacture of certain kinds of paper. One of the journals of the rubber trade made its appearance in a cover containing about 1 percent of the sap or latex in the finished paper, and both the folding and tearing strengths of the paper were perceptibly increased, while water-repellent properties were at the same time imparted to the paper. It is now proposed to use rubber latex in the making of boards, leather substitutes, linoleum substitutes, etc., though much larger percentages of the latex must be introduced into the last named products than is necessary with paper. In the latter case, the object aimed at is to improve the quality of the paper by the addition of comparatively small percentages of rubber, without seriously changing or affecting the paper qualities.

Rubber latex consists of colloidal solution of rubber in water, which varies in rubber content from 20 percent in young trees to 40 percent in old trees.

By introducing rubber latex as an ingredient of paper boards, leather and linoleum substitutes it was sought to emphasize the rubber qualities of the product, whereby the strength, hardness, flexibility, elasticity, texture, etc., of the goods could be made capable of illimitable variation and development.

It is said that insects which destroy paper, wood and other cellulosic materials with rapidity and ease in tropical countries will not eat rubber. A latex board heavily loaded with talc or china clay should therefore have a usefulness in the tropics and in such countries as China and Japan. Boards made from waste paper and loaded heavily with talc or clay are much increased in strength by the use of latex. The strength of boards may be increased 50 or 100 percent, while the finish and folding properties are greatly improved. Thin boards containing latex may be obtainable in the not distant future, and the advantages of these for the making of containers would consist of light-weight and waterproof packages and boxes.

Perhaps the most important aspect of the utilization of rubber latex in the papermaking and allied industries is the ease with which rubber may be vulcanized when incorporated with paper. Small proportions of sodium sulphide are said to be capable of effecting a self-vulcanization process—say, half of 1 percent on the weight of the total material in the beater. This imparts to the paper board an increase of strength calculated at 20 percent or over. Thus a board, breaking with a load of 500 lb., would when subjected to the vulcanization process, break with a load of 600 lb. or an increase of 1 lb. for each square millimeter of cross-sectional area. These are the claims put forward for rubber latex as an ingredient of paper by Frederick Kaye, an English engineer, who was the first to propose its use as a strengthener of paper. Chemists are sceptical about the properties of sodium sulphide as a vulcanizer. Mr. Kaye appears to use it in an acid solution in extreme dilution.

Meanwhile the United States Rubber Company has developed a disk spray process, for producing rubber from the latex. In this process the latex is allowed to flow on to a rapidly revolving, horizontally mounted disk, from which it is thrown in an umbrella-shaped spray or mist into a heated current of air or inert gas. The process resembles that used in making powdered milk.

Until recently rubber was precipitated directly in the plantations, the latex being too unstable to be transported. A direct vulcanization and utilization of latex was also considered impossible of accomplishment, though several processes for the manufacture of rubber goods directly from it have since been developed. Some of these processes are still in the experimental stage, but as in the case of paper products there are a few fields in which latex appears to have decided advantages over rubber manufactured in the usual way. The latex has, for example, been applied successfully in the manufacture of tire treads, carcass compounds, inner tubes, soles, heels, belt covers, cements and rubber goods generally.

The kind and degree of subdivision and emulsification of the rubber globules in the latex differ from that in india rubber to which in physical properties it is superior. The so called "nerve" of the rubber, its strength and elasticity, which is greatly reduced by the process of precipitation, rolling, heating and treatment with solvents, is preserved in products derived directly from latex. Besides that the price of latex products is in all cases, where spraying or dipping is considered, lower than that of rubber solutions since it is used directly without the addition of expensive organic solvents.

Two interesting and important applications have been described recently by one inventor, Dr. Rudolf Ditmar, of Graz (Austria).

(1) Manufacture of a perfectly elastic, mothproof, airy, hygenic pillow filler which can be washed and sterilized. Fillers like kapok, horsehair, feathers, etc., are dipped in latex or sprayed with it. They can then be vulcanized.

(2) Use as a cement and adhesive for all kinds of materials. Latex is said to dry completely in four hours; to adhere to various materials much better than most adhesives known and used until the present time. It is also said to exhibit an exceptional mechanical strength and to be perfectly water-repellent. It naturally cannot be used for purposes where it may come into contact with rubber solvents.

Patents have been taken out covering the use of latex for paper sizing; but it has been demonstrated in American mills that latex has no advantages over resin sizing with regard to some essential properties of the paper.

Good Year's Report

The annual meeting of Ritchie and Ramsay, Limited, coated paper manufacturers, Toronto, was held recently when a report of the past year's operations was presented showing that a fair business had been done. The company has been incorporated twenty years and, for several years previous, the business was conducted under a partnership arrangement. C. N. Ramsay was elected President, George W. Pauline, Vice President and Managing Director and John M. Finlay, Secy.-Treas. J. D. Montgomery and A. V. Ritchie, Toronto, were elected members of the Board of Directors.

Waste in the Pulp & Paper Industry

Farmers Can Teach Manufacturers

By **B. T. McBAIN**

A FEW days ago a group of well known Pulp and Paper Manufacturers were gathered together to do all within their power to aid in perpetuating the timber supply of the Lake States not alone that their business might continue but that the next generation might not be forced to import lumber for every known purpose as well as for pulp and paper manufacturing.

During the arguments brought up someone mentioned the Legislature of a particular State, which probably can be taken for most all States and wondered where the public had looked to select the membership thereof. Without any further comment that might in someway get me in bad and leaving that part to be told in private, one paper man asked the last speaker, "Would you be willing to put your business aside to run for the Legislature and if you won give six months of your time to consider all the fool questions that are brought up each session." "Indeed I wouldn't" answered Bill. The question was then asked of all ten present and the same kind of a reply received from each one. "Well, then quit your kickin'." I don't blame you. I wouldn't do it either if I thought I could be elected.

So it goes in every line of endeavor. We are all too busy to attend to the biggest work there is in the land. We all take care of our business from day to day working under the Laws forced on to us by men who know nothing about our business but who are elected to do the work we should do for ourselves, if we want it done differently than it is being done.

These men vote taxes on to the Public, which includes you and me; they vote restrictions against your business and mine; they vote licenses here and special privileges there all of which have a bearing on our future, but we sit aside complainingly to be sure, but instead of offering ourselves on the Altar of Public Sacrifice that the Ship of State may be properly guided through the troublesome waters of the present day seas of Political privilege we go about our business with the idea that we are too busy and haven't the time, trusting to luck that maybe the next bunch will show a gleam of human kindness or common horse sense and correct the errors of those preceding them.

Who among the Pulp and Paper Industry of the various States will step forward and offer to help? Will You?

Farmers Can Teach Manufacturers

By **B. T. McBAIN**

THE farmer has learned from experience that he cannot market his fruit or grain all at one time and get the best results for his year's efforts.

He has found from experience that he cannot regulate the supply to the demand by planting more one year than another.

He has organized his efforts with those of his fellow in business and formed co-operative warehousing and selling organizations, to the betterment of his industry, the public and himself.

The manufacturer is still trying to get by under the old practices of the farmer. He manufactures when there is a demand and finds it a difficult matter to produce enough. He shuts down his plant during the dull season at great loss to himself and his whole organization.

The manufacturer is not allowed under the Law to form co-operative selling organizations but as I am told by those who should know, there is nothing to prevent manufacturers from having enough confidence in each other to organize co-operative warehousing associations where their product can be stored during the slow periods and marketed when the demand warrants, each one for himself, of course, but shipped for him by the Warehousing Association's Department of Shipping on a co-operative basis of cost.

This would greatly relieve many manufacturers of shut down costs which are the causes of many losses in the wrapping game today.

Each day's shut down causes 4 to 5 percent increase in conversion costs and such an increase today is greater than the profit on many grades with many mills.

The farmer has learned from experience and to his sorrow that the way the manufacturer carries on his business is destructive **and impossible.** Why doesn't the manufacturer profit by the experience of the farmer?

This is one of the great Wastes in the Pulp and Paper Industry today.

Hurlburt Plant Closed

The Hurlburt Paper Manufacturing Company's plant in South Lee, Mass., owned by the American Writing Paper Company, will be closed for an indefinite period, according to notices posted at the plant. Practically all of the business which has recently been handled at South Lee will be transferred to the plants of the company at Holyoke, Mass. The Hurlburt mill is built on the site of the first paper mill ever built in Massachusetts and until the General Electric Co. plant was built at Pittsfield, was the chief support of the population of South Lee.

* * *

Warehouse Burned

The three story paper stock warehouse of Jacob Bargar & Sons at 240 Second Street, Chelsea, Mass., was gutted by fire Mar. 12 with a loss of $40,000 of which $10,000 is on the stock and the balance on the building. There was insurance on the building but none on the stock. Fire departments of both Chelsea and Everett, Mass. battled the flames for three hours.

* * *

Shows Good Report

The Perfect Paper Co., of Holyoke, Mass., a West Virginia corporation, in its recent balance sheet report to the state, shows total assets of $315,000 of which $99,286 is listed as surplus. The company is capitalized at $160,000.

Annual Report Good

The annual report of the F. N. Burt Company, one of whose activities is the manufacture of paper boxes, has been mailed to the shareholders and it shows a splendid increase in business, although decreased profits, owing to special expenditures made during the year in developing new lines of merchandise which are expected to be big producers in the future. An increase in profits during the year is also shown by the annual report of the American Sales Book Company, Limited. During 1924 the company is celebrating the fortieth anniversary of the founding of the sales book industry by S. J. Moore, of Toronto, who is president of both the F. N. Burt Company and the American Sales Book Company. Mr. Moore established the world's first sales book factory at Niagara Falls, N. Y., from which the first shipment of books was made in January, 1884. This anniversary is being featured in a national advertising campaign which the company is conducting, and which is expected to bring a further extension of business.

* * *

May Install New Machine

At the postponed annual meeting of the Provincial Paper Mills, Limited, which is to be held in Toronto on March 20 the question of installing a second book paper machine in the company's plant at Port Arthur, Ont., will be considered. The mill is now running at capacity with orders booked ahead until April 1st but whether or not the company will decide to make the proposed expansion this year will depend upon marked conditions later. Secretary S. F. Duncan stated that he was inclined to the belief that the new machine would not be installed this year although the matter would be definitely settled at the annual meeting.

* * *

Stops Inquiry

After six months' inquiry, extending from Sault Ste. Marie, Ont., through the Province of Quebec and the Maritime Provinces, the eastern branch of the Commission on Pulpwood, concluded its collection of evidence in the City of Quebec when Quebec forestry experts were heard in camera to supply the commissioners with technical and statistical reports concerning the pulpwood situation in the province. Joseph Picard, chairman of the Commission, stated that he expected the report of the commissioners would be presented to the Federal Government in May, as the western section of the Commission would complete its inquiry within three weeks time.

* * *

Lincoln Mills Fail

The Lincoln Mills, Limited, manufacturers of book, writing, wrapping paper and paper flour bags at Merritton, Ont., passed into the hands of a receiver by an order of the Ontario courts on Feb. 21. In a circular issued to the trade, R. Home Smith, of Toronto, the receiver and manager, states that the operations of the company will in no way be interfered with and that the action taken was wholly connected with the securities of the company. The receivership will only continue for such period of time as may be necessary in order to readjust the securities situation. The company is capitalized at $1,500,000 under the presidency of J. J. Warren. The mills superintendent is K. S. Maclachlan.

OPEN TOP CARS FOR PULPWOOD SHIPMENTS

These Cars Will Be Provided In Near Future

OPEN top cars for the shipment of pulpwood to New York State paper mills will be provided, and the feared withdrawal of this type of railroad equipment will not be carried into effect. This was the announcement made at the meeting at Philadelphia of the Middle Atlantic States Regional Advisory Board by A. H. Campbell of the International Paper Company, chairman of the paper and pulp commodity committee.

It is interesting to note that this problem of the paper manufacturers was the first to be settled through the organization during the last few weeks of the Advisory Board for this region. The Board is composed of shippers and railroad representatives, working together in an effort to solve the problem of adequate car supply to meet the shipping requirements of the region.

In making his report, Mr. Campbell merely called attention to the fact that the question of the supply of open top cars, which has been before the paper mills for eight months, without solution, has been readily solved through the agency of the Regional Advisory Board in five weeks.

After Mr. Campbell had reported, however, W. J. L. Banham, general chairman of the Board, commented that the chairman of the Paper and Pulp Committee had been altogether too modest, for through his aggressive work the first specific question to arise since the formation of the Advisory Board had been settled satisfactorily to all parties, and added that the question involved complications which made it not only the first such problem to be solved, but one more than ordinarily difficult to adjust.

The question of open top cars was submitted to the Paper and Pulp Committee by other paper mills than those of the company Mr. Campbell himself is connected with.

* * *

Increase Capacity

Abitibi Power and Paper Company is applying to the Ontario Legislature for a change in the corporate status of its subsidiary, the Abitibi Transportation and Navigation Company. The change is merely to give the company the power of a railway company and involves changing the name to the Abitibi Railway and Navigation Company. It does not imply any immediate change in extension of the company's activities. The company now operates a railway line from the mill at Iroquois Falls, northwards to the Canadian National Railway line, east of Cochrane. The railway is used for hauling wood to the Abitibi properties. Abitibi's annual statement will be issued in a few days and will indicate, it is anticipated, a very satisfactory year's record. Profits are likely to show some increase, for the corporation produced 4,000 tons more newsprint in 1923 than in 1922, its total production being around 145,000 tons. There will not be the same important deduction for depreciation of the "wood pile" that characterized the 1921 and 1922 reports. It is fully expected that Abitibi will increase its production this year by more than 4,000 tons. New records of daily production are being set up from week to week and there have been many days when the mill has gone over the 500-ton mark. The mill was originally built with a rated capacity of 425 tons a day, but bids fair to establish a normal output of 500 tons a day.

Make Good Report

In its annual financial report covering the year ended December 31, 1923, Howard Smith Paper Mills, Limited, shows considerably higher earnings than in either of the two preceding years. Operating profit was $767,377, as compared with $691,370 a year ago. Sundry revenue of $6,429, comparing with $2,169, brought total revenue to $772,807, as compared with $693,540. Bond interest required $220,466 and general interest $49,494. The sum of $60,287 was allowed for depreciation as compared with $95,491 the preceding year. These deductions left a balance of $442,560 as compared with $400,108 last year. Payment of deferred dividends amounting to $120,000, and common dividends amounting to $221,622 left a balance of $100,938, but this, together with the previous balance of $16,065, was completely wiped out by the appropriation of $78,180 to sinking fund and $38,823 to reserve and contingent funds. It might be that the sinking fund requirement will be considered by some a prior charge to dividends. Leaving this item out of consideration, however, the company shows 8.7 per cent on the common stock after depreciation.

* * *

Favors An Embargo

The first commercial organization to place itself on record as heartily in favor of the embargo on pulpwood exportation to the United States is the Chatham, N. B., Board of Trade. This body, at a special meeting, endorsed the campaign now being waged to introduce the embargo, on the ground that the measure would result in the building of additional pulp and paper mills in Canada, and also aid in the conservation of pulpwood. Chatham is one of the most important pulp centres of the Maritime provinces and is located in the pulpwood territory on the north shore of New Brunswick. A pulp mill controlled by the Fraser companies is located there, together with the offices of many pulpwood buying and operating concerns and individuals.

* * *

For Big Pulp and Paper Mill

The largest sales of timber in the history of Quebec occurred when 2,500 square miles of timber in the basin of the Manicouagan River were purchased recently, it is reported, by the Rothemere interests, for the sum of $1,000,000, payable in three installments, and an additional charge of $16,250 a year ground rental. The terms of the contract further provide that the purchasers are to erect a pulp and paper mill, with a daily capacity of 200 tons of pulp and 100 tons of paper, within five years, and to increase their output of paper to 200 tons within seven years.

* * *

Production Is Advanced

The International Paper Co., New York, is continuing the increased production schedule at its newsprint mills at Three Rivers, Que., and has not advanced the basis to 310 tons per day, as compared with a previous output of 240 tons per day. Another increase is expected to be made at an early date. The company has recently discontinued operations at two of its minor mills at Watertown, N. Y., due, it is stated, to over-production. One of the mills has been running on regular newsprint, and the other on a higher grade of special print stock.

A Warning

Against Buying Foreign Paper From Samples Submitted and on Promises of Early Delivery

Do not be misled into buying foreign paper from samples submitted and with promises of very early delivery.

Information has reached PAPER that paper is now being sold under false pretenses that closely border on absolute swindling. A test case was recently followed through to test the theory of American paper manufacturers that such was the case.

Samples of high grade vegetable parchment were shown in America, purporting to be the product of a big Belgian mill. Shipment was promised in two weeks. Some five months or more later the paper arrived. It was no more like the samples than good rag bond is cheap paper board. It was so far under the sample that it could not be utilized for the purpose it was intended at all.

And here is the poignant agony of the thing: The paper was paid for at shipment time and with international complications involved there was no practical redress to be found.

Of course the paper was sold cheap, comparatively speaking. But no paper is cheap if it is not as represented to be.

SECOND ANNUAL
PAPER
INDUSTRIES EXPOSITION

PEOPLE connected with the Paper industry in different parts of the country far and near, are in a state of expectation. The time is drawing close when the great annual interchange of ideas, news and information will take place, at the Paper Exposition.

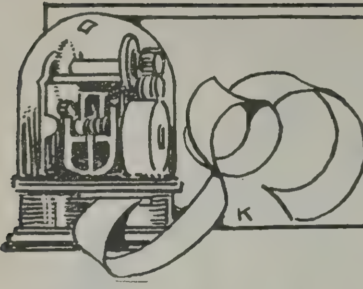
There will be men there who have studied the subject of PAPER from every viewpoint—men who will tell and show how they have solved vital problems—the same problems that come up in your organization.

Besides getting helpful ideas regarding essential materials, methods, equipment, etc., the light of information is thrown on such things as the manufacture of chlorine gas, control instruments, coagulants and causticizing apparatus, pumps of all kinds, stokers and furnace equipment, castings, tubes, silica iron apparatus, acid condensers, rolls and beaters, paper felts—in short, the entire line of paper mill supplies.

The Exposition will tell the complete story of paper—starting from the forest and the measures used to prevent waste and insure the supply of paper raw material for the future. It will cover everything in paper making up to the finished products among which will be shown the latest products of the paper maker and converter.

Come to the Paper Exposition. Send your assistants and employees. Results will show in the months to come.

PAPER INDUSTRIES EXPOSITION Grand Central Palace, New York City



LATEST MARKET REVIEW

OUTLOOK ONLY FAIR FOR PAPER PRODUCERS SAYS, REPORT

Output Moving Into Consumers' Hands Practically at Rate of Manufacture

WHILE the demand for paper products is not progressing on an even scale, conditions in the industry are described as about normal and seasonal expansion is being experienced in various grades, Increasing demand for raw materials and advancing prices for certain of these materials have been the first reflection of this expansion. Some strengthening of quotations on finished paper has been noted, without, however, any general tendency toward a higher level of prices.

Conspicuous absence of speculative interest in paper gives evidence of the increasing stability in the paper markets of the country, according to a review of the industry published by The Standard Daily Trade Service. Buying, it is added, is mainly on a basis of current needs, consumers anticipating neither a scarcity of leading grades nor any substantial advance in prices over prevailing levels. While consumption will be relatively high this Spring, an easy supply situation is now indicated, according to the review.

"The feature of the past month has been the marked scarcity and the steady upward price trend of rags and waste paper, an advance of 5 to 25 per cent. having been recorded for both domestic and foreign materials," says the review. "Despite reports of a possible embargo on French and Belgian papermaking rags, current prices are about as high as can be sustained, and further marked advances are improbable.

"Quotations on standard newsprint have held unchanged since August, 1923. Notwithstanding some recent slackening in forward business they probably will be maintained during the near-term at current levels. Spot demand is in sufficient volume to insure a steady movement of newsprint from the mills, even though consumers are not likely to anticipate their needs for an advance. Quotations on ground wood, however, have declined since January—a decline which has reacted to the advantage of the mills.

"Book, writing and wrapping papers have been in steady demand since the first of the year, with prices substantially unchanged. Buying of these grades is increasing in line with the general industrial trend, although sharp competition is acting to keep quotations at recent levels. Seasonal requirements of the clothing and millinery trades account for the slightly higher quotations of tissues, with prospects of further strength this month as buying from these trades promises to be well sustained.

"Production of paper, as reported by the American Pulp and Paper Association, increased 13 per cent in January over the seasonally low December total. Aggregated production was estimated in January at 419,615 tons, as compared with 370,605 tons in December and 409,139 tons in November. With the exception of book papers and wall papers, January outputs of leading grades showed an increase over the latter months of 1923. Much of the increasing output, however, went toward expanding stocks rather than into consuming channels in January. Book and wall paper stocks alone were smaller on February 1 than at the beginning of the year.

"Paper is now moving into consumers' hands practically at the rate of manufacture. With stocks of only about normal proportions, with demand promising to show further expansion during the Spring months, and with prices fairly well stabilized, the near-term outlook is at least moderately favorable to the paper producers."

* * *

Badly Damaged by Fire

The Old Mill Paper Products Company of 106-114 Lincoln Street, Boston, was badly damaged by fire February 27. The company occupies the third floor of the structure while the fire was on the sixth floor but considerable damage resulted from water and smoke.

Deficit Announced

A deficit of $254,021.23 after all deductions for depreciation, bond interest, and taxes, is shown by the Eddy Paper Corporation, of Illinois, in its condensed statement for the year ending December 31, 1923. Geo. N. Seaman, president of the company, announces that $122,932.02 of the amount is accounted for by decrease in the value of the inventory to conform to present market prices. During the last year the general efficiency of the Three Rivers and White Pigeon mills were largely increased by the installation of new equipment.

* * *

Merger Progressing

It is stated that those desirous of consummating a merger between the Spanish River and Abitibi companies are said to be making rapid progress with their plans and are likely to be in a position to submit them to the companies concerned very shortly. The present plant consists of the formation of an entirely new company which will offer its stock to the two companies on the ratio of six sheets of new company for every five Abitibi held and two shares of new company for each one of Spanish common, in addition to provision for bonds and preferred stock.

* * *

A Busy Month

February was a busy month for Canadian paper mills according to the production figures which gave an output of 111,664 tons, which compares with 91,935 tons for February of the last year. January production was 109,875 tons, bringing the total for the two months up to 221,539 tons.

Paper and Board

New York, March 25—There have been several fairly important developments in the paper market within the last few days. Probably the most important is the report that one of the largest manufacturers in the country of wrapping papers, if not the largest, has advanced prices of kraft wrapping a quarter of a cent per pound, with some special lines of kraft paper priced at half a cent per pound above previously ruling levels. The reaction upward in kraft paper prices appears to be the culmination of numerous conditions in the market rerecently which have been creating a firmer situation in this class of paper. From all accounts, importations of kraft wrapping from German and Scandinavian sources have shown a decline, and with foreign competition less keen, domestic manufacturers of wrapping paper are in a more favorable position and apparently are trying to get market levels for their product back to where they can realize a fair rate of return in their manufacturing operations.

Another development is the reported firmer situation in tissue papers. The spring usually is an active period for this kind of paper especially the high grades of tissue which are used in the clothing trades and by retail establishments and some mills are reported to have jumped quotations 5 and 10 cents a ream No. 1 white tissue being quoted at 80 cents and higher, and No. 2 white and No. 1 manila tissue at about 75 cents a ream. Demand for tissue has improved quite perceptibly of late, according to reports. Merchants are laying in stocks for the Easter trade, and there has been a better call for supplies from converters. Tissue mills are said to be running at greater capacity than since last fall, with prospects of continued good business during the next several months.

The market for newsprint continues. Another large daily newspaper in New York City has gone out of existence, having been merged with one of the other morning dailies in this city. Newspapers have been disappearing so frequently in the metropolis in the past year or so that some concern has been felt in the paper trade regarding the likely effect on the newsprint market situation. It is stated, and statistics would seem to bear out the contentions, however, that the loss in print paper consumption in this city has been slight. When two papers are merged the decrease in circulation has been more or less negilible, so that very nearly as much newsprint is used as when the papers are printed separately.

It would appear as if newsprint is running neck and neck with the high level reached in the last year. One of the afternoon dailies printed a regular issue of 40 pages one day last week, which was something of a record for the newspaper in question. The morning dailies are running unusually large in size, while in the Sunday issues contain equally as many pages as during any period for a year or longer.

Newsprint production in the United States in February totaled 117,322 tons, compared with 128,772 tons in January, according to figures just issued. Shipments from mills were 115,427 tons in February, against 123,253 tons in January. Output of Canadian mills in February totaled 111,664 tons, contrasted with 109,875 tons in January, while shipments amounted to 109,901 tons, compared with 107,966 tons in January.

All records of newsprint consumption in the United States were exceeded in 1923, according to a report made public by the Government. The figures for 1920 were exceeded by about 28 per cent. and those of 1922 by about 15 per cent. Total net consumption, according to the Department of Commerce, amounted to approximately 2,800,000 tons, of which mills in the United States produced 1,506,204 tons. This production was practically all consumed in the United States, the exports during the year being approximately 16,360 tons. Production in this country for 1923 was about 1.8 per cent. less than that for 1920 and only about 2.55 per cent. above that in 1922. Canadian production increased largely, however, and increased imports took care of the heavier consumption in 1923.

Book paper is quotably steady and meeting with fair demand.

INTERNATIONAL
Wire Works

"The Fourdrinier that took the
Ire out of Wire"

INTERNATIONAL WIRE WORKS
MENASHA, WISCONSIN

A consistently good movement of fine papers is in progress, and there is a better than average demand for specialties.

Box boards are still somewhat unsettled in price but the market is improving in point of activity as the spring demand becomes more pronounced. Most mills in the East quote chip board at around $40 a ton f. o. b. New York, and news board at $45 per ton.

Mechanical Pulp

Ground wood prices seem to be holding at maintained levels following the recent downward movement, and while plentiful supplies are apparently afforded consumers, there are no signs that any unusual surplus of mechanical pulp is held unsold at present. Buyers are operating in the market on a most conservative scale. Few are ordering except to cover direct requirements and there is consequently a rather quiet market condition, yet business is of at least normal volume with both contract and transient buyers taking pulp in a steady way. Domestic producers quote around $32—as an average price—for spruce ground wood for prompt shipment, quotations of course depending on the air dry test and the haul from grinding to consuming points. Foreign ground wood is selling at about $32 to $33 a ton ex dock New York.

Foreign and Domestic Chemical Pulp

Probably the outstanding turn in the chemical pulp market is the firmer tone developing in bleached sulphite. This is due, from all appearances, to the strike situation in Norway, which, it is felt, may result in a curtailment of shipments of bleached sulphite from that country to the United States, and which would be an important factor since American paper mills secure a good part of the bleached sulphite they use from Norwegian manufacturers. Prices have not changed but the tendency is toward a stronger position. Kraft pulp also exhibits a firming tendency though buyers as a rule are covering their wants at the same prices obtaining recently, Scandinavian kraft being quoted at from 2.50 cents a pound upward ex dock New York, and No. 1 domestic kraft at from 2.60 cents upward at pulp mills. Demand for chemical pulp is at best spotty though some members of the trade aver that the aggregate volume of buying is not so small. Quotations ex dock New York and f. o. b. pulp mills are as follows:

Domestic Rags

There is a good deal of irregularity in the demand for papermaking rags, and while no further broad changes in prices have occurred, the market tone is on the soft side and buyers in frequent instances are securing the supplies wanted at concessions. It is the usual thing for rag prices to ease as the spring comes around, and it is probable that the prevailing easiness is due to the season, accompanied as it is by a decrease in demand from consuming quarters. On the other hand, there are some grades of rags holding quite firm in price. New cuttings show little disposition to sag in value, and the better qualities of old rags are holding their own in price. Roofing stock is selling on a basis of about 2.40 cents a pound f. o. b. New York for No. 1 packing and 2.25 to 2.30 cents for No. 2 grade. Old thirds and blues are quotably steady at 3.50

A ROLLING STONE GATHERS NO MOSS

PULPWOOD AND WOOD PULP IN NORTH AMERICA

By Royal S. Kellogg

Author of "Lumber and Its Uses," "The Cost of Growing Timber," "The Timber of the United States"

270 Pages 87 Illustrations

A graphic presentation of one of the vital economic problems of the day—the securing of an adequate supply of paper.

This book is of special interest to everyone connected with the pulp and paper industry and equally so to all users of print paper. It points out clearly what must be done to develop sufficiently our supply of pulpwoods.

GREEN-BAY WIRE WORKS

Use
Green Bay
Wires
FOR
Larger Tonnage

With over 20 years of practical experience in the wire business, we started our present plant six years ago and in spite of the adverse conditions of the paper industry, we have brought our production up to over half million sq. ft. per year. We are constantly adding to our list of satisfied customers. We are making special weaves, seams and edges for all paper making purposes.

Roofing Rags, No. 1	2.40	@	2.50
Roofing Rags, No. 2	2.25	@	2.35

Imported Rags

There is fair buying interest in foreign rag stock but papermakers are seeking to get the supplies desired at reduced prices, and indications are they are succeeding in a majority of cases. Dark colored cottons are selling at 2.25 cents a pound ex dock New York for spot lots, and these rags are said to have been bought down to 2 cents for forward shipment from Europe. Old blues are steady in price, and new cuttings show little or no change. Quotations ex dock New York are as follows:

Lins., White, No. 1	15.00	@	16.00
Ger. Blue Cottons	3.75	@	4.00
French Light Blues	4.00	@	4.50

German S. P. F.'s	6.00	@	9.00
German Light Prints	4.00	@	4.50
Dk. Colored Cottons	2.25	@	2.35

Bagging, Rope, Etc.

Old rope prices are well maintained under a fairly steady movement of this commodity to paper mills. Domestic No. 1 manila rope is fetching 6.50 to 6.75 cents a pound f. o. b. New York, and foreign manila rope is quoted by local importers at 6.25 cents or higher ex dock at this port. Most of the buying of bagging is being done by roofing paper manufacturers, who are paying in the vicinity of 1.40 cents a pound New York. F. o. b. New York prices follow:

Gunny No. 1	1.50	@	1.60
Foreign	1.40	@	1.50
Wool Tares, light	1.40	@	1.50
Roofing Bagging	1.35	@	1.50

The Pickles Drying Regulator

Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to

Old Paper

The trend of old paper values continues downward. Demand apparently does not measure up to available supplies of this material, and, as is invariably the case when the movement to mills slackens, prices pursue a downward slide. Shavings are quoted at 3.75 cents a pound f. o. b. New York for No. 1 hard white and 2.75 cents for No. 1 soft white shavings, and it is more than likely that purchases have been made at lower figures. Folded newspapers are selling at 75 to 85 cents a hundred pounds New York, and No. 1 mixed papers at about 65 cents, with sales at cheaper figures also reported in these grades. Old magazines are quoted at 1.40 cents a pound New York for heavy flat stock, and ledgers at 1.85 cents. Quotations named by New York dealers f. o. b. this city are:

No. 1 Hard White Shavings	3.65	@	3.85	Ledger Stock	1.80	@	2.00
No. 2 Hard White Shavings	3.00	@	3.25	Kraft, No. 1	2.25	@	2.25
No. 1 Soft White Shavings	2.70	@	2.90	New Manila Cuttings	2.00	@	2.25
Box Board Chips	.70	@	.80	New Manila Env. Cuttings	2.75	@	3.00
No. 1 Colored Shavings	1.60	@	1.80	Bogus & Mill Wrappers	1.00	@	1.10
Magazine flat stock	1.40	@	1.60	News, strictly overissue	1.00	@	1.10
No. 1 Crumpled	1.20	@	1.35	Folded News	.75	@	.85
Solid Ledger Books	2.00	@	2.15	No. 1 Mixed Papers	.60	@	.65
				White Blank News	2.15	@	2.25
				Common Paper	.45	@	.55

Twines

The twine market is fairly active insofar as routine business is concerned. There is, however, a lack of new buying of importance. Consumers are merely filling their needs as they develop, and dealers in turn are ordering from mills in restricted fashion. Prices are quotably steady, the strength in raw material being a sustaining factor. Quotations are as follows:

Sisal Hay, pure	14.25	@	15.25	Jute Wrapping twine, A grade	20.00	@	
Manila Hay, pure	16.25	@	17.25	Papermakers Twine	11.50	@	
Sisal Lath yarn	13.25	@	14.25	B. C. Hemp, 18	.39	@	.40
Manila Rope, pure, ¾ inch diameter	16.25	@	17.25	B. C. Hemp, 24	.38	@	.39
Hardware Rope	14.25	@	15.25	B. C. Hemp, 36	.37	@	.38
Jute rope, ¼ diam. nnd over, coils	13.00	@	15.00	America Light India—No. 6	14.50	@	
Sail twine, A grade	20.00	@		No. 7	13.50	@	

Chemicals

There is no change of consequence reported in papermaking chemicals. Quoted prices are on about last reported levels, and demand is of strictly routine character.

IMPORTS AT NEW YORK

Week of March 17-22

Paper

Str. Montauk, Antwerp—C. W. Williams & Co., 24 cs.; Gevaert Company of America, 46 cs. photo; Steffens, Johns & Co., 9 cs. printing; from Hamburg—Baldwin Shipping Company, 6 cs.; Chemical National Bank, 134 rolls newsprint.

DRYER FELTS
STANDARD and MULTIPLE PLY

ENGLISH WEAVE

In Two, Three, Four, Five and Six Ply, 60 inches to 176 inches in width.

BY ACTUAL TEST this felt will dry 33 per cent more paper, with ABSOLUTELY NO FELT MARKS IN THE PAPER

TRIUNE
THREE PLY FELT for other paper

FITCHBURG DUCK MILLS
FITCHBURG MASSACHUSETTS

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not only by what you put into the equipment but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged anywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

THE ORR
FELT & BLANKET CO.
PIQUA, OHIO

Paper Testing Methods
(1922)

A large edition of this handbook for paper mill laboratories was exhausted shortly after the type had been distributed. In view of the insistent demand the Technical Association has arranged for a republication and *Paper Testing Methods* is again available at $3 per copy.

The work covers detailed procedure for microscopical analysis, physical testing and chemical analysis of the paper with descriptions of the apparatus employed.

It is the only complete and up-to-date handbook on paper testing published in the English language.

It should be in the hands of every paper manufacturer and paper dealer as well as concerns who are large users of paper.

Lands for plants, fronting **deep water for deep sea** loading. Millions more cords of wood available very cheap. A clear stream of fresh water free for washing pulp. Address Box 245, care of PAPER, 1478 Broadway, New York City.

FOR SALE

Beaters—One N & W 48x48 rolls, 21"-6" Two iron tub rolls 52"x40".

Bed Plates—Large lot, all sizes. New.

Calenders—One 7 roll 72"; one 9 roll 72" one 5 roll 78"; one 7 roll open side 84" One 7 roll 124".

Calender Rolls—Large assortment, all sizes one 14x86"; one 18x84"; one 18x100" and many others.

Coaters—One 45" Waldron, double coater and others.

Cutters—One 38" Guillotine.

Cylinder Moulds—One 36"72"; one 30"x52" one 12"x22".

Drives—One No. 1 Reeves Class E; two No 3 Reeves Class E, 4 to 1; one No. 3 Class E; one No. 6 Large Reeves; one No. 10 Reeves, F-3 to 1 with extra disc.

Dryers—48x116.

Exhausters—One Sturtevant.

Fans—3 Hunberry; 2 Perkins.

Jordans—One N & W Monarch, with new shell two Horne; two Emerson, large size, one base; one N & W Pony, with extra plug.

Pulleys—One 98"x34" face, double arm, modern, Iron pulleys; Cone pulleys for Marshall Drives.

Pumps—One dry suction Knowles 12x22x18; one 1000 gal. Blake Tank pump; two Lawrence Mch. Co.'s Class A 8" high duty; two 6" Emerson make; one 4" Centrifugal; one Type 4 Gould 5" triplex, self contained. Two Lawrence Machine Co.'s Class A, No. 4, double suction pump for high elevation or for low speed. Thoroughly rebuilt and ready for shipment.

Press Rolls—One pair new, one RC 18x80"; one Gun metal 18x81"; one 16x75"; one RC 15½x73½".

Rag Cutters—Two No. 2 Daniels; one Perkins.

Screens—4-8 pl. New Success.

Slitters—One 86" P & J.

Winders—One 86" P & J; one 100" P & J; one 112" M & W.

Wet Machines—One N & W with cut offs, mould 30x52"; two spare moulds.

One set Dillion Doctors for 80" calender rolls.

MILLS MACHINE COMPANY
Lawrence, Mass., U. S. A.

THE CLEARING HOUSE—Continued

MISCELLANEOUS

Representation is solicited of responsible mill which seeks to sell paper or pulp in this country. Considerable experience and success enjoyed in the industry. Age 34; university training and well connected. Will share expense of a trip to home office of mill interested in interview. Address Box 1289, care of PAPER.

Experienced publicity and advertising man who can make paper carry any desired message of interest to the promoter, for any legitimate business or its expansion for greater profit, is open for engagement. Address H. C. Beatty, Box 58, Wilkinsburg, Penn.

GOVERNMENT BIDS

Treasury Department,, Bureau of Engraving and Printing, Washington, D. C., March 1, 1924. Sealed proposals are invited to furnish Dextrine, Oils, Textiles, Dry Colors, Paper Boxes, Paper and Check Paper, during the fiscal year beginning July 1, 1924. The right is reserved to reject any or all bids or parts of bids. Samples of Dextrine, Oils, Textiles and Dry Colors must be received at the Bureau of Engraving and Printing not later than 2 P.M., Wednesday April 9, 1924. Samples of Paper Box Blanks, Paper and Check Paper, must be received not later than 2 P.M. Monday, April 7, 1924. Blank forms with specifications for proposals, giving dates on which the bids for the several schedules will be opened, and further information will be furnished on application to Paul E. Twyman, Assistant Director.

TREASURY DEPARTMENT, Office of the Secretary, Washington, D. C., March 15, 1924. Sealed proposals will be received at this office until 11 o'clock a. m., Wednesday, April 16, 1924, from manufacturers of bond, bank-note and other fine papers for furnishing bank-note paper of the highest quality containing the distinctive feature now in use by the Department, for the printing or United States currency and public debt securities, national and Federal reserve bank-notes, Federal reserve notes, etc., for the fiscal year beginning July 1, 1924. Blank forms for submitting proposals, with specifications and further information will be furnished manufacturers who intend to bid upon application to this office, where samples of the paper required may be examined. A. W. MELLON, Secretary of the Treasury.

PULP AND PAPER MILL ENGINEER—Technical graduate, married, aged 35; fourteen years' experience in applied structural and mechanical engineering of pulp and paper mills. Capable of assuming the technical responsibility of your plant from the drawing board to the erected job. Thoroughly familiar with all process. Correspondence solicited. Address Box 1261, care of PAPER.

WILL SHIP WOOD AND PULP FROM NORTH

To Transport Big Volume of Groundwood and Pulpwood To Consolidated Mills

THE consolidated Water Power and Paper Company, of Wisconsin Rapids, Wisconsin, is making preparations to raft about 40,000 cords of Canadian pulpwood across Lake Superior next summer. The wood will be transferred to railroad cars at Ashland, Wisconsin, and from there be shipped to the Wisconsin Rapids, Biron and other Wisconsin mills of the Company. Geo. C. Schneider, manager of the company's timber interests, was in Ashland last week preparing for the summer's business. In addition to the pulpwood it is expected that about 3,000 tons of groundwood from the Port Arthur, Canada mill will be shipped in scows or freighters. The during the summer.

The company is building a new dock at Port Arthur, from which its groundwood will be shipped in scows on freighters. The pulpwood is brought to Port Arthur from the forests and is ground. Heretofore this product has gone by rail from Port Arthur to Duluth, via Fort Francis and from thence to the paper mills in the central part of Wisconsin. To avoid this long haul, the Consolidated Water Power and Paper Company will fit out the old Commercial dock at Ashland and use it for storage purposes, for the groundwood brought across the lake by scows.

The winter's output of groundwood at Port Arthur will be shipped by rail as usual if needed, but if not absolutely needed at that time, it will be taken across the lake in scows during the summer months. The company will probably bring a half million dollars worth of pulpwood across the lake this season, not including the ground pulpwood which will be scowed across the lake.

The tugs Butterfield and Erna, of Green Bay, will tow a half a dozen or more rafts across the lake, but the groundwood will be handled by other vessels.

* * *

Production Good Again

Heavy shipments are being made by the recently organized Reliance Paper Company, according to Harry E. Munson, formerly production manager of the Victory Bag and Paper Company, now president of the Reliance Company. The Reliance Company deals in paper specialties doing job work for dealers over a wide area. An active sales force has been organized and put on the road since January. While at present only job work is being done it is possible that the company may begin manufacture in the future, according to Mr. Muson.

* * *

Supers To Meet

There will be a meeting in Marinette on May 2 and 3 of the paper mill superintendents of the northwestern district. This district consists of the mills in the upper peninsula of Michigan, the Fox River valley, the Wisconsin River valley and the Menominee and Peshtigo Rivers. This convention is expected to bring together about 200 executives. Thirty or forty mills will be represented. The association is a section of the American Paper and Pulp Association and trade matters will be discussed at the meeting.

To Build Addition

Contract for a $100,000 addition to the Sutherland Paper Company of Kalamazoo, Mich., was let at a special meeting of the board of directors during the week. The new building will be erected at once by the Oscar F. Miller Company. It will be one story high, except for a small portion which will be two stories high, and will have 58,000 square feet of floor space. The offices of the company will be located on the restricted floor of the second story. The structure will be built of reinforced steel and concrete.

With the completion of the new structure, the present pressroom will be extended to be one of the largest in the Middle West. It was only last summer that the Sutherland Paper Company completed the task of reclaiming and filling a large area of low land lying just to the east and south of the main buildings . The plot was seeded to beautify the mill surroundings, but the expansion of the firm's business compelled the company to use the site for the proposed new building.

* * *

To Build Addition

As a result of a satisfactory agreement reached with the city of Marinette, the Marinette and Menominee Paper Company will soon erect a large addition to its present plant, costing in the vicinity of $200,000. The city council authorized purchase of land required for a better approach to the Erdlitz bridge, agreeing to pay $1,000 and the paper mill company made an offer of $1,000 to the city for that part of the present street to be vacated. Part of this land will be needed for the addition to the mill. The company is given the right to go ahead using as much of the land as needed as soon as it desires.

C. S. Cooke Dies

C. S. Cooke, of the Dells Paper Company, of Eau Claire, Wis., who died last week in the Mayo Brothers' hospital at Rochester, Minn., was buried on Wednesday at Eau Claire. Mr. Cooke was 67 years old and came of a pioneer family interested in the paper manufacturing business. His twin brother is H. S. Cooke of Kaukauna. Besides the widow and two sons there is another brother, W. D. Cooke, of Green Bay and two sisters, Mrs. Jessie Oaks and Miss Jennie Cooke, both of Oaks Corners, N. Y.

HOMAS J. KEENAN, F.C.S., Editor

ISMAR GINSBERG, B.S., Contributing Editor

A Few Stray Thoughts

Next week is the big week. It is the gala week of the year, the annual Mardi Gras of the paper industry. It is the one time of the year when the paper manufacturer and his aids leave home to talk business and enjoy the experience. It is the time when troubles are forgotten, when joy is unconfined, when business is injected into the system in equal parts with happiness.

It will be the gay convention week. It will be reminiscence week. It will be education week. And above all it will be good-fellowship week. The annual convention is—and it should be—the clearing house of ideas. It is the time when everyone should pass on the good things learned in the last year, when the lessons, bitter or sweet, should become common property for the benefit of the whole.

Convention time is inventory time considering the industry as a whole. Upon the results of the last year as reported at the convention the plans for the coming year should be laid, the budgets made up and the course plotted so that the mistakes of the last year are eliminated.

* * *

Thomas J. Keenan can now be found at the office of Paper every day in the week, giving the best that he has in him to the paper industry. He wants to know personally every man in the industry and in coming to New York, drop in and talk things over. If papermaking troubles are causing gray hairs to grow in your head, see Mr. Keenan. He may be able to help—and he certainly will cheer you up.

* * *

Paper cordially invites you to its headquarters at the Paper Industries Exposition at the Grand Central Palace. Booth 83 will always have a pleasant word waiting for everyone. A neat exhibit has been prepared and you will be welcome the entire week.

If there were many more Frank Munseys amalgamating about the country, the newsprint industry could curl up and die. Every time one shuts his eyes and opens them again another newspaper has been killed off. The time may come when newspapers in New York will be as rare as eggs of the dodo—if the dodo has eggs.

* * *

Go East, young man—is the call to the manufacturers of the stuff called pulp and paper just now.

* * *

There are so many things to be considered in a serious way at the convention that some forethought should be given to them. The Wise plan to battle with the huge wave of imports is one of these things, which should be dwelt upon at leisure and not in the excitement of convention.

* * *

Some of the most important matters are being taken up on the editorial pages of this issue. Far-reaching changes are in prospect. This year's convention week has more significance than in many years past. As such it should be closely watched.

* * *

The last call to get your advertisement in the big Convention Number of Paper is now out. Don't let that big, joyous number go to press without your advertisement. Every page is going to have valuable facts and interesting reading for the industry. It will be printed on fine coated stock, will be profusely illustrated and will be a number you will be proud to have around for the entire year. See that your copy is sent in at once.

Kellogg on National Forestry Program

Secretary of News Print Service Bureau Puts a Few Facts Before the Committee on Agriculture at a Hearing on Bill to Make the Program Effective

THE proposed National Forestry Program, provided in House of Representatives Bill 4830, was discussed at a hearing on the bill before the Committee on Agriculture at Washington, Wednesday, March 26. R. S. Kellogg, secretary of the News Print Service Bureau, who is also chairman of the National Forestry Program Committee, made a strong effort to secure action on the bill. In a statement to the Committee on Agriculture he spoke in part as follows:

Legislation Sought—Will Conserve Forest Resources

Nothing new or revolutionary is proposed in the pending legislation. It is the logical outcome and culmination of fifty years of consecutive effort to conserve our forest resources.

There is now substantial agreement upon facts and principles and it is clearly demonstrated by overwhelming weight of evidence that any adequate plan for the maintenance of our timber supply must inlude.

Effective fire prevention on both pubic and private forest land.

Scientific utilization of forest products.

Forest planting upon large areas of denuded land.

A substantial proportion of well distributed forest land in public ownership upon which there may be grown the older lasses and larger sizes of timber which we cannot expect in sufficient quantity rom private initiative.

Must Grow More Timber

It is futile to think of depending upon oreign sources for any considerable fuure supply of wood products. We must grow more timber at home or alter the ntire plan of American life and industry.

It is helpful to state a few truths as to he methods of forestry:

Forestry is not a law compelling the planting of a new tree for every one cut.

Foresty is not a law limiting the cut to ertain sizes and kinds of trees.

Forestry is not arbitrary control by any public body over the operations of private nterprise.

Forestry is not fire prevention—though his is everywhere necessary.

Forestry is the application of definite scienific principles to the growing and using of mber crops.

Forestry is and will be practised by the private owner when he can see that it ays him to do so.

Forestry is and must be practised by Government upon public property in order o insure some supply of forest products or the people. Because of the long time nvestment and comparatively small return hereon, together with hazards of fire, insect, fungus and storm, a considerable area of publicly owned forests will always be needed although public ownership of the entire forest area of any country is neither necessary nor desirable.

The proportion of total forest area in public ownership of some form in the leading European countries in the practice of forestry is 35 per cent in France, 53 per cent in Germany and 24 per cent in Sweden. Private capital engages in the growing of timber and cooperates with the public authorities in so doing in those countries, because capital gets a fair return therefor. Private capital will do so elsewhere with a market for forest products and the same assurance of safety of return.

Federal Leadership Needed

Any practical solution of the problem of continuous forest production must be based upon the principle of Federal leadership and cooperation with the States and timberland owners.

1. A survey of forest resources and land classification to determine what timber we have, how much we need, and how much can be grown.
2. The determination for each forest region of the essential requirements for the maintenance of forest productivity.
3. Sufficient National appropriations to be expended in cooperation with State and other agencies to make such requirements effective.
4. Provision for extensive research into problems of timber growth and utilization.
5. Forest planting upon a large scale, by both Federal and State agencies.
6. The devising of better methods of forest taxation and their adoption by the States.
7. The continual building up of publicly administered forests through purchase, exchange, transfer from the public domain and the several forms of public reservation until 40 per cent of the ultimate forest area of the United States is permanently devoted to timber growing or watershed protection under public control.

At present 20 per cent of the forest area of the United States is publicly owned, but the situation is badly unbalanced. From the Rocky Mountains West, 70 per cent is in public ownership and from the Rockies East but 3 per cent.

The Program

The immediate National program should include:

1. An appropriation of not less than $1,000,000 yearly for cooperation with the States in fire prevention, the National Government to spend no more for this purpose in any State than the State itself spends therefor, including the expenditures of forest owners required by State law.
2. A definite authorization of yearly expenditure for the purchase of forest land upon the watersheds of navigable streams according to the recommendations of the National Forest Reservation Commission.
3. An appropriation of $1,000,000 yearly for forest research and investigation, including studies in forest taxation and forest insurance.
4. An initial appropriation of $100,000 yearly for forest planting in cooperation with the States and otherwise with provision for increases up to a total of $1,000,000 yearly within ten years as planting facilities and forest protective measures are improved.
5. Authorization for determination by the Secretary of Agriculture of what lands, owned by the United States and not now embraced in National Forests or National Parks, are valuable chifly for the production of timber or the protection of watersheds and provision for their ultimate inclusion within the National Forests or such other protection and administration as will promote their best use in the public interest.

These items represent the minimum of measures that are immediately practicable, have the widest application and are not of controversial character.

None of these items can be rightly charged to the National expense account. They are investments in the future and permanent welfare of the country—an insurance of our greatest and most necessary natural resources. Their permanent inclusion in the National budget will be an act of constructive statesmanship which will be heartily supported by the people regardless of party affiliation.

PAPER AND PULP MEN BEHIND BILL

Association in Hearty Accord With McNary-Clarke Bill

THAT the paper industry, as represented by the American Paper and Pulp Association is in hearty accord with the principles of the McNary-Clarke forestry bills was the statement made by Warren B. Bullock, on behalf of that Association, before the House Committee on Agriculture. He presented this statement, signed by Henry W. Stokes, and Dr. Hugh P. Baker, president and secretary of the Association.

"The Paper industry is a wood-using industry. Its premanency in this country depends upon a continuous and adequate supply of pulpwood. Of this approximately 7,200,000 tons of paper produced in the United

(Continued on page 47)

Acidity and Papermaking

A Practical, Technical Discussion

By **JESSIE E. MINOR**
*The Collins Manufacturing Company,
North Wilbraham, Mass.*

OF recent years, as a result of chemical research, men are learning more and more about the part played by the presence or absence of a slight amount of acidity in controlling chemical reactions. By applying this knowledge of acidity requirements to industrial processes, men are finding that by giving more attention to controlling acidity variations they are eliminating much of the variation and difficulty encountered in making the finished articles.

Acidity Control Is Important

In the process of papermaking, due to the complexity of the reactions involved and the extreme sensitivity to disturbance of the materials used, the matter of acidity control plays a very important role at a number of stages. The corrosion of iron pipes, causing rust particles and brown stains to be carried into the pulp and on to the paper is a well known acidity difficulty, but the relation of acidity and such problems as the purification of water, the accumulation and elimination of grease and beater gum, the pitch lumps in some basic colors, the fading of colored pulp, the loss of rosin sizing, the excess wear of machine wires and the age deterioration of finished papers is not so well known. Many a practical difficulty of a serious nature could be solved by a scientific analysis of the acidity requirement at some particular stage of the process and, where necessary, the use of indicators in controlling acidity. For this reason, the following review and discussion of the acidity conditions which, so far as our present knowledge is concerned, are found at the various stages of the papermaking process, is given in the hope that it may be of interest to some practical papermakers.

Definition of Terms

Perhaps the first requisite for such a review would be a clear definition of the terms used in discussing acidity and of the practical methods for detecting acidity. By the term FREE ACIDITY is meant that amount of acidity which is available for reaction in a solution at any one instant and in scientific literature the variations of free acidity over the narrow range which can be detected by the ordinary indicator solutions is referred to in terms of the pH of that substance. This pH is more properly a measure of alkalinity since it is expressed in numbers which increase as the acidity decreases; thus, the slightest measurable acidity is called a pH of about 12 and the largest amount measurable is about 3. By the term TOTAL ACIDITY is meant that amount of acidity which can be obtained from a compound for reaction and it includes the free acidity and the combined acidity. For instance, the free acidity of a solution of alum is very slight, but if that alum is in contact with a compound which slowly uses up that acidity, the alum is capable of progressively generating more acid from the neutral molecules until all of the combined as well as free acidity has been destroyed. This distinction of free, combined and total quantity applies to alkalinity as well as acidity. For instance, a caustic soda solution has a very high free alkalinity and a very low combined alkalinity. A lime solution may have a total alkalinity equal to that of the caustic soda solution but its free alkalinity is slight and it cannot be used instead of caustic where a drastic alkalinity is required. Lime has, however, a marked advantage over the caustic solution where a slight alkalinity to be maintained for some time is required. In any liquid of very high free alkalinity or acidity the distinction between free and combined vanishes, since under those conditions the greater portion of the alkalinity or acidity is free. Perhaps it would make it clearer to say that total acidity or alkalinity differs from the free quantity much as the voltage of an electric current differs from the amperage.

Determining Acidity or Alkalinity

Total acidity determinations can be made for any amount present, but free acidities are only determined over a narrow range on each side of the neutral point. The method commonly used for determining this free acidity or pH is to find that indicator which, when a drop is added to a small portion of the liquid to be tested, colors the solution a color which is part way between the acid and alkaline colors for that indicator. Thus, an indicator which changes from yellow in an acid solution to blue in an alkaline solution would show at neutrality some shade of green; one which changes from red to yellow would show some shade of orange, etc. The exact pH indicated by the shade of color in the neutral zone of each of the common indicators can be found from tables of values. For very exact work the pH determinations are made by a determination of the amount of electric current which the solution will conduct under definite conditions but the manipulation is too complex for mill control work. In speaking of free acidity or alkalinity, the terms can be made quite definite by merely giving the pH number, but in speaking of total alkalinity or acidity, the term indicating the amount of acid or alkali added for neutralization is not definite unless the indicator used is also mentioned as some substances in solution will generate acid or alkali so slowly that to one indicator considerable is present, to another none at all.

Classification of Indicators

For convenience, those indicators which may be serviceable in papermaking may be classified in their order of sensitivity as follows, the first mentioned being the least sensitive to acids and the most sensitive to alkalies:

Indicator	pH Indicated by the Neutral Field	Color Change. Acid to Alkali
Methyl Orange	3.1 to 4.4	Red to Orange
Congo Red	3.0 to 5.0	Blue to Red
Methyl Red	4.4 to 6.0	Red to Yellow
Litmus	4.5 to 8.3	Red to Blue
Brom Thymol Blue	6.0 to 7.6	Yellow to Blue
Cresol Red	7.0 to 8.8	Yellow to Purple
Phenolphthalein	8.3 to 10.0	Colorless to Red

A glance at this table will show that it is possible to have a substance like alum which can be both acid and alkaline at the same time and in dilute solution it is acid to phenolphthalein and alkaline to methyl orange. In speaking of acidity or alkalinity, unless care is taken to mention the indicator or the pH, it should be understood to have reference to the free acidity indicator Brom-thymol-blue, since that indicator is neutral to pure distilled water which has a pH of about 7.2.

Water Requirements

In papermaking there is used such a relatively large amount of water that a knowledge of the acidity and alkalinity requirements of water is of paramount importance to papermakers. A very alkaline water will deposit lime salts on the fibers, thus interfering with rosin sizing, will coagulate the rosin milk and thus further reduce the sizing ffect, will gather traces of pitch, grease and dirt into asses which will stick to beater and machinery, and will ause endless trouble. A very acid water, on the other and, will harden the fibers, making it more difficult to eat them to slowness and in numerous ways will injure e process. If the water before using is to be decolorized y alum treatment, then the acidity requirement is of utost importance for there is only a very narrow range of cidity through which alum can be made to form flocks. f the total alkalinity to such an indicator as Methyl range lies between 4 and 10 or the pH between 6 and 8, en the alumina of the alum will form large flocks which ill slowly settle to the bottom of the settling tank carry- g with them all of the coloring matter of the water. Vider deviations in the total alkalinity or acidity may or ay not mean unfavorable conditions dependent upon the ature of the impurities in the water. It is quite pos- ble to obtain satisfactory results from alum treatment hen the water after treatment has a total alkalinity of 20 25 provided such alkalinity is due to the presence of e slightly soluble bicarbonates.

Brom-Thymol-Blue Test

A very satisfactory technical control of the process is to st the treated water continuously with the indicator Brom- ymol-blue. If the water turns this indicator some shade f green, indicating that the pH is somewhere between the vo limits for that indicator, then the acidity condition is ght for the utilization of the alum in forming large flocks. f the raw water is excessively alkaline, then alum must be dded until the pH lies between 6 and 8; otherwise, the lum will form soluble aluminates and sulphates with the lkaline elements in the water and will not form the alumina ocks which are needed to take care of the colored im- urities in the water. In such a case there is every chance at the alumina which goes through the filter in the form f aluminates will be precipitated on the fibers at some ter stage of the process and, in extreme cases, it may isturb the rosin sizing before it is properly disseminated roughout the pulp. If the original water is acid, the alum annot be made to flock or remove any dirt, no matter how uch is used, unless an alkaline medium like lime, soda ash r caustic soda is also added. The acidity of the alum eutralizes the alkalinity of the added alkali and brings the ree acidity of the water to a pH at which the alumina can orm flocks. Both lime and soda ash are largely used in ractice and the choice between the two is partly a matter f the nature of the impurities in the water and partly a atter of the personal opinion of the man in charge of the lant. In either case the amount of alkali must be so reg- lated that the combined effects of alkali and alum will ring the acidity within the limits required for flocculation nd also contain alum enough to give sufficient flocks to arry down all color. Excess alkali will do no harm rovided extra alum is also used to protect against the ex- ess alkalinity and this is sometimes necessary in case the mount of colored impurities to be removed varies widely ut for a uniformly colored raw water, excess alumina ocks involve an expensive waste. Excess alum beyond at needed to neutralize the alkali is carried through the lters in the filtered water and its disadvantage is slight. he purification of a water which varies from day to day its acidity calls for considerable attention but it is quite ossible for a workman to be taught to make daily acidity ests and to so regulate the feed of alum and alkali as to eet the actual requirements of the water, thus maintaining constant supply of colorless water for use. In more than ne mill daily water tests have shown a color maintained onth after month which does not vary from that of pure istilled water.

Bacteria That Are Harmful

Besides coloring matter, some natural waters have bac- eria infections which, especially in the warm weather, ause considerable trouble. For instance, if a colony of renothrix bacteria or other iron bearing bacteria which thrive only in acid media and which do not become entangled in the alumina flocks would be carried through the filters and would finally meet an acid medium, they could, in the course of a comparatively few hours multiply at such an enormous rate as to cause the accumulation of a mucilage, at first white, later turning to a dirty brown, which adheres so tenaciously to pulp as to be a cause of considerable trouble in various ways. Other types of bacteria will instigate oxidation reactions in the pulp starting the formation of the troublesome oxycellulose which will bring about color fading, lack of rosin retention, brittleness with age, etc. The best protection against bacteria infection lies in feeding to the water a product such as copper sulphate or chloride of lime which will poison the life of the bacteria and prevent its growth at any stage of the papermaking process. But here also excess is to be avoided since, especially with chloride of lime, it would be more harmful than the bacteria itself. Excess of copper sulphate colors the water blue and excess of chloride of lime can be detected by the starch-iodide indicator which will detect one part in a million parts of water.

The Washing of Rags

Rags which have been cooked in lime are very much more easily washed if the water is slightly acid than if it is alkaline. The surfaces of the fibers are somewhat softened by the alkaline cook and the lime and iron compounds, as well as certain other objectionable substances are largely embedded in the fibers and are difficult to wash out. The addition of a little acid to the wash or the use of a water which is slightly acid will harden the surfaces of the rags and at the same time dissolve out those objectionable adhering substances. If quite dirty rags have been drastically cooked and then considerable acid is used, there is a possibility of setting the dirt by a too complete hardening of the surfaces over the adhering colored impurities. Washing with a water which is slightly acid has been found to be advantageous but here care must be taken to insure that such acid water does not deposit on the fibers rust scales from iron pipes or valves.

Acid Bleach for Rags

A bleach solution may be alkaline or acid dependent upon the relative amounts of chlorine and lime or soda. In recent years there has been considerable interest in an acid bleach for rags. Such a bleach is made by introducing liquid chlorine into an alkaline pulp liquor beyond the requirement for neutralization, or into an insufficient amount of milk of lime. In either case the excess of chlorine reacting with the water gives a considerable acidity which hastens the bleaching action and also tends to hasten the softening of the rags. For woodpulp it is not advantageous to use liquid chlorine beyond the amount needed to neutralize the alkali as woodpulp is quite sensitive to the action of excess acid.

Action of Acid and Alkaline Bleaches

The more alkaline a bleach solution is, the less easily will it part with its active chlorine and the slower and less effective is the bleaching action. The more acid the bleach solution is, the more rapid and effective is the bleaching, but the more the danger to fiber structure. This is the reason for the common custom of storing a bleach solution in an alkaline form to keep it from wasting in the air, then adding a small amount of acid when using it to give it greater activity. The use of alum for acid in "brightening" bleach has the advantage of protection against the accidental contact of fiber and strong acid but has the disadvantage of setting on the fibers alumina flocks which interfere with the washing out of the lime. Acetic acid, which is not a very strong acid, would be a far better brigthener than alum.

A By-Product of Bleaching

While the act of bleaching is due to the presence in solution of free chlorine or of hypochlorous acid, there is formed as a by-product of the reaction the strong hydrochloric acid, commonly known as muriatic acid, and it is this acid which is responsible for the acidity and continued softening of rags in drainers after the last trace of bleach, as shown by the starch-iodide test, has evaporated. If either rag or wood fibers have been overbleached or have been subjected to an excess of such strong acid as hydrochloric acid, the cellulose of the fibers is partly changed to hydrocellulose and oxycellulose. Oxycellulose is a weakly acid product and its formation when once started continues in the finished paper causing an ever increasing discoloration and brittleness with age.

Testing for Oxycellulose

The bleaching process should be controlled by testing the bleached fibers before introducing them into the beater for the presence of oxycellulose, using a Fehling reduction solution, and the amount of bleach used and the conditions of bleaching should be so regulated as to give the minimum amount of Fehling reduction consistent with the desired whiteness of fibers. Many papermakers would be surprised to learn how closely this Fehling reduction in the raw materials regulates the physical properties of the finished papers. With rag stock intended for high grade papers for permanent keeping, only the slightest trace of Fehling reduction or preferably none at all should be permitted. In wood stock or in other furnishes intended for papers for immediate use or for immediate coating, a much wider tolerance of oxycellulose formation is permitted. For some papers a little oxycellulose is desirable since it seems to aid in the obtaining of the desired amount of mucilage formation in the furnish, while in bonds and ledgers oxycellulose causes endless difficulty in rosin sizing and in the keeping qualities of the papers.

Use of Antichlors

In many mills a certain amount of Antichlor is used to hasten the destruction of the last trace of bleach which again involves acidity changes. When sodium thiosulphate or sodium bisulphite, also called sodium acid sulphite, is used, the Antichlor reacts with the bleach residues in such a way that acidity formation is hastened and the free acidity of the pulp is markedly increased. Unless the pulp is very well washed before running on the machine, this acid can cause rapid destruction of machine wires. The writer has seen machine wires entirely eaten through in one week entirely due to the acidity of the furnish from the use of Antichlor. Normal sodium sulphite has the advantage over the two previously mentioned antichlors in that in its reaction with bleach it does not form acid residues although considerably more weight of the normal sulphite is required to destroy the same amount of bleach than is required for the thiosulphate. The by-product here is practically neutral and, in such small amounts, it is without effect on the pulp. Sodium sulphite is soluble in water and is easily washed out if not used by the bleach, but calcium sulphite, which is also free from acid formation, forms with water a white milk and the insoluble lime residues are probably held fast by the fibers although they are said to have no appreciable harmful effect on the process. In general, washing and draining are far more satisfactory methods of removing bleach than the use of Antichlor of any kind.

Control of Pitch Trouble

When unbleached sulphite pulp is used, the frequent occurring pitch troubles could be largely controlled by the use of a slight acidity in the beater water though not too much for the obtaining of the desired wetness of furnish. In rag mills there is often a similar difficulty from the accumulation of waxes and greases from the rag stock together with lime soaps of these greases formed in the boiler cooking. These masses are largely eliminated by the use of the soluble soda compounds instead of the insoluble lime ones in the boiler cook and more acidity in the washing. These small masses of pitch or grease are electrically attracted by the lime salts of alkaline waters and form sticky masses which, during constant agitation slowly gather into larger and larger masses which then settle on the pulp and on the sides of beater and apron. If acid is added directly, it must be with care else injury will be done to the stock and the pH of the solution should be controlled with indicators. Alum may be used more safely provided that it does not require so much that an objectionable amount of alumina is accumulated which may oppose the dissipation of the sticky masses. It is usually safer and satisfactory to eliminate beater greases by the addition of a glue solution which acts on the greases much as soap does on dirt by surrounding the tiny particles with films which keep them from gathering into masses or adhering to pulp or beater.

Best to Have Beater Liquor Slightly Acid

A perfectly clean furnish may be beaten in a liquor which is slightly alkaline as alkalinity hastens the slowing of a furnish, but the ordinary industrial furnish of pulp is much more safely beaten in a liquor which is very slightly acid, having a pH below 3. This would mean a liquor just alkaline to Methyl orange and acid to Brom-thymol-blue. This acidity does not interfere with the slowing of the stock but it does gradually dissolve lime soaps and prevent the gathering of sticky masses. When a pulp has been beaten to the desired consistency, the addition of the rosin size will make it quite alkaline and at this time any iron salts which have got into the furnish are precipitated as brown flocks on the fibers. The subsequent addition of alum to the furnish will again make the liquor acid but the alumina settles on the fibers and largely prevents the solution of the deposited iron stain. Since rosin and the cellulose of fibers are both electrically negatively charged, the positively charged alumina is essential as a binding agent to hold the rosin firmly attached to the fibers and prevent its being washed off in the back water. The function of the acidity of the alum is merely to neutralize the alkali of the size soap and release the free rosin for adherence to the fibers. An insufficiency of acidity leaves some rosin soap in the furnish which acts as does soap elsewhere in surrounding the particles and preventing their adherence to the fibers. These particles of free rosin which are held on to the fibers by the alumina are partly melted on the machine dryers and spread out to form a continuous waterproof film.

Use of Sodium Silicate

Sodium silicate is often recommended for its sizing effect but the difficulty in its use lies in the fact that for good results it should be added some time before the alum, thus necessitating beating the stock in an alkaline medium and taking a chance at accumulating pitch, grease, etc. If it is necessary to add some substance to aid in the beater sizing, a good grade of glue, free from sulphur dioxide or strong acid is far safer and more efficient.

Prepared Starch Products

When using prepared starch products such as Feculose, Hercules Gum, etc., care should be taken to see that no shipment contains acid residues from the chemical treatment of the starch, as a markedly acid coating, applied wet, will have a splendid opportunity to develop oxycellulose at the expense of the strength and color of the paper. Glues are less likely to have strong acidity although many glues are bleached with sulphur dioxide and the residues when not properly washed out form sulphurous acid which, besides having acid properties, is a strong oxidizing agent forming oxycellulose in the paper.

The addition of alum to a glue intended for tub sizing increases the acidity of the glue by an amount dependent upon the amount of lime or other alkali residues in the glue. There is little danger of excess acidity from this source since the density and jell strength of the glue is so rapidly destroyed by excess acid that it would be at once detected. Some glues will come up in strength with the addition of alum more than others and this is very largely due to the variation in the alkali salt content of the glue.

This outline of acidity requirements covers only the better known and more commonly occurring conditions but it may serve to emphasize the extent to which the work of technical control in the papermaking process may be a matter of controlling acidities at every point of the process.

How Napoleon Depended on Scientists

ascinating Story of Science and Scientists Under Napoleon I—Problems in Industrial Chemistry That Got His Attention—His Fondness for Science

AUVELET DE BOURRIENNE, who was Bonaparte's private secretary from 1797 to 1802, referring to the fact hat the class of sciences had been given recedence over that of literature in the *nstitut National,* says in his Memoirs: Considering the state of literature and cience at that period, the First Consul id not make a wrong estimate of their mportance. . . . Although the literature of France could boast many men of great talent, ... yet hey could not be compared with Lagrange, Laplace, Monge, Fourcroy, Berthollet and Cuvier, whose work has o prodigiously extended the bounds of uman knowledge." France, during he Napoleonic period, was indeed extremely rich in men whose names are writ in the history of science; Vauquelin, Proust, Guyton de Morveau, Gay-Lussac, Coulomb, Hauy, Biot, Arago, Lamarck, de Candolle may be dded to Bourrienne's list. The state f literary depression, which prevailed hroughout the Consulate and Empire, was partly due to the attitude of Naoleon himself. His practical mind was naturally attracted by science; but terature had not much appeal to him, nd in his later years he disliked and istrusted literary men. They were heorists, phrasemongers. "These peole," he said, "are good for nothing uner any government. I give them rewards because it is my duty as Chief f State; they occupy and amuse idle minds. But I will make Lagrange a enator; there is a brain."

A narrative of absorbing interest concerning the relations of Napoleon Bonaparte with the chemists and mathematicians of his time is contained in a contribution by A. R. Pearson, M. Sc., LL. B., to the March issue of Chemistry and Industry, the official organ of the Federal Council of Pure and Applied Chemistry and of the Institution of Chemical Engineers. Under Napoleon's leadership, industrial chemistry made great progress, partly under the stress of necessity, as after the defeat of the French navy at Trafalgar, the problem of making France independent of overseas products became an acute one. While there are no references to pulp and paper as commodities, the technical men among our readers will appreciate the dependence which Napoleon placed on the chemists and other scientists with whom he loved to associate.

Revival of Chemical Science

The period of the French Revolution was a time of revolution also in physical cience. Speculation and the construction of "systems" were giving place to quantitative experiment with balance, burette and colorimeter. The overhrow of the phlogiston hypothesis by he work of Lavoisier, Laplace's invesigations in celestial mechanics, and the liscovery of galvanism, had not only timulated the enthusiasm of the initiaed, but had aroused a more general inerest in science. This revivification or renascence was nowhere more evident than in France. The tragic fate of Lavoisier and Bailly during the Terror was quite unconnected with their status as scientific men. It was part of the result of a transient outburst of political fanaticism, and must not be construed as representing a general hostilty towards science. The famous dicum of a member of the revolutionary ribunal, that the Republic had no need of savants, was meant rather to silence a petitioner than to lay down a principle of Republican government. The Jacobins made much use of the services of scientific men in the national defence; and some of the latter, who would have been condemned on political grounds, were saved on account of their possible utility to the State. It was on this plea that Guyton de Morveau saved the great mathematician Lagrange from being exiled on account of his foreign birth.

First Polytechnic School

In the social reaction after the fall of Robespierre, it was fashionable to take an enlightened interest in science and literature. Thus Bonaparte writes from Paris to his brother Joseph in July, 1795: "Luxury, pleasure and the arts are reviving here in a wonderful manner . . . Libraries are formed, and we have lectures on history, chemistry, botany, astronomy. . . ." In the same year, the Convention founded the *Ecole Polytechnique* as a school of pure and applied science, to rank besides the colleges hitherto exclusively devoted to law, literature and medicine. (The last of these three subjects was rather an art than a science in those days.)

The old *Academie francaise* and the *Academie des Sciences* having gone the way of other royal institutions in 1793, the Convention created in 1795 a National Institute, composed of men distinguished in various branches of learning. The Institute was originally divided into three classes, devoted respectively to science mathematical and physical, to science moral and political, and to literature and the fine arts. It was reorganized in 1803 under the First Consul's direction in four classes, namely:—

(1) Physical and mathematical science.
(2) French language and literature.
(3) Ancient literature.
(4) Fine arts.

It was characteristic of Bonaparte to suppress the class of moral and political science. He would not encourage discussion, criticism and possible ridicule of his government by the *ideologues* whom he so despised.

Bonaparte a Member of the Institute

Bonaparte had, himself, been elected a member of the Institute in the classes of science and arts at the end of 1797, and he acknowledged his election in the following letter, which displays a clear perception of the value of research and the contribution which science can make to national prosperity:—

"CITIZEN PRESIDENT,—I am honored by the suffrage of the distinguished men who compose the Institute. I feel that before being their equal I shall long be their pupil. If I can convey in any more expressive manner my esteem for you, I shall be glad to do so.

"True conquests, the only ones which leave no regrets, are those which are gained over ignorance. The most honourable, as well as the most useful, occupation for nations, is to assist in extending human knowledge. The true strength of the French Republic should henceforth consist of not allowing a single new idea to exist without adopting it as part of its own property.

BONAPARTE."

Scientists with the Army

Acting on these opinions, he included in the Egyptian expedition of 1798 a band of scientific men—chemists, physicists, biologists—who were to assist in developing the resources of the country. The idea of adding a corps of savants to a military expedition was a novel one, and the party was an object of some suspicion to the rank and file during the hot and thirsty march up the Nile to Cairo. The men, having noticed that all vestiges of antiquity were carefully examined, vented their discontent in invectives against the savants; who, they said, had started the idea of the expedition in order to carry out antiquarian researches. And when, on any alarm, they were ordered to open the square and give the learned party, mounted on asses, with their instruments and baggage, safe footing within, they used to receive it with military jests: "Room for the asses. Stand back, here come the savants and the *demi-savants!*"

One of the General's first acts after subduing the country was to form an Institute of Science and Arts at Cairo, modelled on that of Paris. It consisted of the savants, staff officers and other interested in learning. The mathematician Monge was president, Bonaparte was vice-president, and the secretary was Fourier, afterwards famous for his work on the mathematical theory of heat-conduction. The papers read before the Institute show a great diversity of topics. Thus we find contributions by Berthollet on the occurrence of sal-ammoniac and on the production of indigo in Egypt; Fourier describes "a general method of extracting the roots of equations"; and one of the staff officers gives an account of a bust of Isis found near the Nile.

Scarcity of Fuel in Egypt

Bonaparte's intention was to plant a permanent colony in Egypt, and with this end in view he proposed a number of important practical matters for consideration by the Institute. Scarcity of fuel is a perennial problem in that country, and it is not surprising to find, among the first of these questions: What means are there of economizing fuel in the army ovens? Water supply naturally claimed attention; the relative advantages of windmills and water-mills were discussed, and Berthollet and his assistants carried out complete analyses of the dissolved solids of the Nile water. The resources of the country for manufacturing gunpowder, and the possibility of finding a substitute for hops in beer, were other problems dealt with.

Of all his scientific advisers at this time, Bonaparte seems to have placed most confidence in Berthollet. Their connection had begun in 1796, when Berthollet and Monge were sent to follow the victorious general in Italy, and to select the works of art which were to be sent from the captured towns to Paris, Berthollet was one of the small party which accompanied the General's sudden return from Egypt in 1799.

Beginning of Studies in Adsorbtion

During the Revolutionary wars against the First Coalition, Berthollet had been employed by the Committee of Public Safety to superintend the manufacture of nitre, and this work seems to have given rise to his first ideas on chemical statics and affinity. He observed that the earthy matter from which the nitre was extracted always retained a portion of it, in spite of the fact that the aqueous solution was far from saturated; and he attributed this to an equilibrium between the "affinity" of the nitre for the earthy matter and its tendency to pass into solution. The phenomenon is now called adsorbtion, and it is well known that the proportion of a substance adsorbed can vary continuously. Hence doubts arose in Berthollet's mind as to the validity of the Law of Constant Proportions. These ideas were further developed during his stay in Egypt by an investigation of the natron lakes in the desert southwest of the Delta. The action of brine on the calcareous rock has caused deposits of carbonate of soda, and these deposits were the subject of Berthollet's first paper on chemical affinity and mass action, read before the Cairo Institute. The complete theory was published in the famous *Essai de Statique chimique* in 1803.

Mamelukes not Impressed by French Science

Berthollet used to give frequent experimental demonstrations before the Institute in his laboratory, which was installed in the palace of one of the Beys. The Mamelukes had a great respect for prophets and magicians, and Bonaparte, with his usual readiness to draw advantage from circumstances, determined to oppose sorcerer to sorcerer. He therefore invited the principal sheiks to one of these demonstrations, expecting to enjoy their astonishment and to impress them with awe of the French conquerors. "But," says Bourrienne, "all the wonders of the transformations of liquids, electrical commotions, and galvanism occasioned in them no surprise. They watched our clever chemist with imperturable calm." And when the demonstration was concluded, the Sheik, El Bekri, informed the interpreter that it was very fine "but ask him," he said, "if he can make me be in Morocco and here at the same time." Berthollet shrugged his shoulders. "Then in that case," answered the Sheik, "he is but half a magician." The standard of professional competence for magicians has always been high in Egypt; he needs both courage and skill who will claim succession to Moses and Hermes Trismegistos, or maintain the traditions of Memphis and Alexandria.

Berthollett's services ultimately gained him the Cross of the Legion of Honour, and he became a Senator and Count under the Empire.

Bonaparte became First Consul towards the end of 1799, and in organizing his administration he chose Laplace as Minister of the Interior. Laplace's studies in mathematical astronomy, his nebular hypothesis, his theory of capillary and his proof that soundwaves are propagated under adiabatic conditions, form a sufficiently imposing monument in the temple of science; but as a minister he was a failure. Bourrienne says of him: "As to Laplace, Bonaparte always held a high opinion of his talents. His appointment to the Ministry of the Interior was a compliment paid to science, but it was not long before the First Council repented of his choice. Laplace, so well adapted for science, displayed the most inconceivable mediocrity in administration; as if his mind, constructed to grasp the system of the universe and to interpret the laws of Newton and Kepler, could not descend to the level of matters of detail nor apply itself to the duties of the department with which he was entrusted." Laplace was indeed wasted in the ephemeral details of administration. Of his ministerial colleagues, Carnot set a high example of integrity in public life; Talleyrand has left us a few epigrams and a reputation for political agility; while Cambaceres was famed for the excellence of his dinners. But what permanent fruits have their labors given to posterity? *Tenues recesserunt consumti in ventos.* Laplace has rendered humanity a more enduring service, and can say, with Horace, *Monumentum feci aere perennius.*

Laplace was superseded after a ministry of six weeks, and nominated to the Senate. He and the First Consul, each the most eminent living man in his *metier*, had a cordial regard for each other. The statesman gave the scientist the Cross of Honour, and the scientist dedicated his *Mecanique celeste* to the statesman.

After a short period under Lucien Bonaparte, the Ministry of the Interior was again offered to a man of science, Jean Antoine Chaptal, Comte de Chanteloup.

An Industrial Chemist's Work

Chaptal was primarily an industrial chemist. Although his name is still to be found in chemical textbooks, it is not associated with any fundamental discoveries such as those of his contemporaries, Berthollet, Gay-Lussac and Vauquelin. The value of his work lay in his applications of chemistry to agriculture and manufactures. Already in 1781, when professors of chemistry at the College of Montpellier, he had started a factory where he made mineral acids, alum, sal-ammoniac, white lead, copperas and other chemical products. He devised improved processes for the extraction l application of the dye in madder ot, and was the author of several rks on applied chemistry (*Teinture coton,* 1807; *Chimie appliquee aux s,* 1807; *L'industrie francaise,* 1816). rring the Terror, on the repeated itation of the Committee of Public fety, seconded by the entreaties of friend, Berthollet, Chaptal devoted nself to organizing the great pow- factory at Grenelle. This circum- nce saved him from sharing the e of Lavoisier, for he had been im- soned once as a leader of the South- Girondists, and would certainly ve been brought before Fouquier- nville as a political "suspect" had t his services been necessary to the obins.

Chaptal became a member of the stitute in 1799, and was called to Council of State in the following ar. Here he came in contact with First Consul, and in November, 00, succeeded Lucien as Minister of Interior. He was an active and ccessful administrator. It was he o was charged with the reorganiza- n of the Institute in 1803, and with formation of the Society for the couragement of National Industry. any useful reforms and projects in ucation, public works, and the im- ovement of agriculture and manu- cture were carried out under his nistry.

Chaptal Resigns and is Promoted

As Napoleon developed his system, no longer wanted men of independ- t mind. He wished everything to under his own immediate cogniz- ce. As Chaptal puts it: "He needed lets, not counselors. His ministers ere merely head clerks." Chaptal as by no means this kind of man, d in August, 1804, two monts after apoleon became Emperor, he ten- red his resignation, alleging the de- e to resume his scientific work. apoleon accepted the resignation, t nominated him to the Senate, here his scientific knowledge and perience continued to be of great e. Mineval the Emperor's *Secretaire Portefeuille,* says in his memoirs: have heard Napoleon complain at this minister did not seek oppor- nities to talk to him . . . and did t inform him often enough of the siness of his department. Perhaps e Emperor was yielding to certain ejudices inspired by the recollec- on of his unsuccessful experiment entrusting the same ministry to aplace . . . and he thought it was bad thing for savants to be distracted om their studies, and that they were ot able to devote themselves entirely the multifarious details of adminis- ation. . . . However, this was not in the case of M. Chaptal, who was practical savant. For the rest, he continued to be treated with great regard by Napoleon, who constantly gave this distinguished scientist the proofs of appreciation of his talents."

Chaptal rejoined the Emperor during the Hundred Days, being made made director-general of agriculture, commerce and industry. His declining years were spent in agricultural pursuits at Chanteloup, where he enjoyed the society of his friends Laplace, Berthollett and Monge.

Making France Industrially Independent

After Trafalgar, it became of the first importance to make France as nearly as possible independent of overseas products. A Council of Commerce and Manufactures, of which Chaptal was a member, was formed to advise on this problem. Strenuous efforts were made to find substitutes for indigo, cotton, cane-sugar, coffee, quinine and the like, and large rewards were offered to inventors. Chevreul, then assistant to Vauquelin at the Museum of Natural History, carried out one of the earliest researches of his long career on the coloring-matter of the woad plant (*Isatis tinctoria*), with a view to restoring it to the position in the dyeing industry from which Indian indigo had ousted it.

Coffee, so extensively used in France, was very difficult to replace. *Tisanes* of various herbs were an alternative rather than a substitute. The annual report of the Institute in 1814 mentions that an infusion of the roasted seeds of the yellow flag (*Iris pseudacorus*) is recommended, and is said to possess febrifuge properties which make it a possible substitute for quinine. Other roasted seeds and roots had been tried, but the report finally admits that "the drinks so obtained resemble coffee only in their dark color and bitter taste."

The scarcity of sugar was the most keenly felt of all privations. Proust, the famous defender of the Law of Constant Proportions against the attacks of Berthollet, had discovered grape-sugar while working in Madrid in 1799. As the overseas markets for wines were cut off, an alternative use for the grapes was welcome; and a member of the Institute named Parmentier published in 1811 directions for purifying grape-sugar and preparing a sweet syrup from it. Proust received the Cross of Honour and a considerable sum of money from the Emperor. The reward was clearly well deserved, but the public opinion at that time was unaccustomed to seeing honors conferred for any but military and political services, and the learned pharmacist seems to have incurred some ridicule in the press:

"Pour avoir compose
De sirop de raisin trois ou quatre topettes,
Mon vieil apothicaire est mis dans les gazettes!"

Beet Sugar Development

The existence of sugar in beetroot had long been known, and the first beet-sugar factory had been started in Silesia under the patronage of the King of Prussia in 1799. The Institute therefore appointed a committee to inquire into the production of sugar from beet and other vegetables. This committee, which included Chaptal, Fourcroy, Guyton de Morveau and Vauquelin, published in 1811 "Instructions pour extraire le sucre de betterave." The first successful French manufacturer was Baron Delessert, one of the leading industrialists of the day, and a member of the Council of Commerce. On hearing of the success of Delessert's process, the Emperor at once rode off with Chaptal to the factory at Passy. Having examined everything, he took off his own Cross of Honour and fastened it on Delessert's breast. Under the drastic protection of the Continental System the industry grew apace; but at the Restoration, the market suddenly flooded with West Indian product, many fctories were closed.

Encouragement for Technical Schools

Napoleon recalled with pride at St. Helena that he had established a system of technical education to supply the needs of industry. From his technical colleges, he said, "hundreds of able chemists went to the different manufactories. In each of them I caused a person well-skilled in chemistry to reside. In consequence, everything proceeded upon certain and established principles, and they had a reason to give for every part of their operations, instead of the old vague and uncertain mode." The provision of teachers for the technical colleges was the function of the Imperial University, which was created in 1806, and placed under the control of a council of eminent savants. These educational measures were drawn up and piloted through the *Corps Legislatif* by the Comte de Fourcroy, director of public education under the Ministry of the Interior. Fourcroy, like Chaptal, was not only a chemist but an efficient minister. Indeed, his work in organizing the educational system, successively under the Convention, the Consulate and the Empire, is a better title to fame than his chemical work; for, although he turned out a great bulk of research, chiefly in collaboration with his pupil and friend Vauquelin, much of it was superficial and hasty. He was an excellent teacher, however, and his lectures on chemistry at the Jardin des Plantes drew large audiences.

Scientists Honored

Professor Volta, of the University of Pavia, invented his electric pile in the year 1800, and the First Consul invited him to come to Paris and demonstrate some experiments before a committee of the Institute. In spite of his load of administrative work and the peace negotiations with England, Napoleon insisted on being present at the session when Biot presented the committee's report, and on his proposal a gold medal and a sum of money were awarded to the inventor. So struck was he with the importance of Volta's work, that he created an annual prize of 3000fr. for the encouragement of studies in the science of electricity and galvanism. This prize was awarded to Davy in 1808 for his work on electrolysis of solutions, and was divided in 1809 between Gay-Lussac and Thenard.

Napoleon was similarly interested by Chaldni's observation that sand spread on a metal plate forms regular figures when the plate is set in vibration. After seeing the experiment he desired the Institute to offer a prize, open to all the scientists of Europe, for a mathematical theory of the phenomenon. There appears to be no record that this prize was ever awarded.

Science in 1798

In the year 1802 the Institute was charged to present to the Council of State a report on the progress and condition of science, literature and art in 1879. Owing to the war, the report was not presented to the Emperor until 1808. The deputation of the class of science was admitted first into the Imperial presence, and after an introductory speech by the president Bougainville, the secretaries Delambre and Cuvier read the reports of their respective sections. These reports give a striking picture of the foundations of modern science in the making.

Delambre, for the mathematical section, dealt with the measurement of the arc of longitude on which the metric system is based. He was himself responsible for the northern half, from Dunkirk to Rodez, and his colleague Mechain for the rest as far at Montjouy, near Barcelona; a further extension to the Balearic Isles was carried out by Biot and Arago.

Covier then gave an account of the advances in physical science, of which may be briefly mentioned: Lavoisier's theory of combustion; the work of Dalton and Gay-Lussac on thermal expansion; Berthollet's theory of affinity and mass action; Hauy's proof of the uniformity of corresponding angles in crystals; the discoveries of Galvani and Volta, and Davy's applications of the voltaic pile; Jenner's discovery of vaccination; the application of chlorine to destroy "germs of contagion" by de Morveau; the analytical work of Fourcroy and Vauquelin on vital products.

The Emperor replied briefly to the deputation, assuring the Institute of his support. "The well-being of my peoples and the glory of my throne," said he, are alike interested in the progress of science."

Meneval, who was present on this occasion, says that "the Emperor remained struck by the eloquence and clearness of ideas of M. Cuvier, who spoke fluently for several hours. Suspending the rule which he had imposed on himself, of not distracting learned men from their studios, Napoleon made M. Cuvier Master of Requests in the Council of State, and gave him a high appointment in the Imperial University."

Cuvier, whose first paper on palaeontology had appeared at the opening of the Institute in April, 1796, was in fact made a Councilor of the University, and later Councilor of State.

Humboldt in Paris

It has been mentioned above that the Emperor became increasingly reluctant to hear any opinion but his own on administrative matters. His contempt for men in general, the habit of despotic power, and his confidence in his star, made it useless to offer advice directly, however good the arguments by which it was supported. But he was always more receptive towards scientific men. He welcomed their conversation; he was always alive to the possibilities of their work, and ready to encourage research. The following anecdote, recounted by Chaptal himself, shows the circumspection necessary in approaching him, and at the same time proves his real regard for scientific work. The celebrated Prussian scientist and traveler, Alexander von Humboldt, had settled in Paris in 1808, and the Emperor suspected him of being a spy. "One day he ordered Savary, Minister of Police, to have him removed from Paris within 24 hours. The order was communicated to Humboldt, who at once came to me and asked me to speak to the Emperor on his behalf. I went to the soiree at the Tuileries; as usual, the Emperor drew me aside to converse.

"What is there new in the scientific world?" he asked.

"Nothing," I answered, "and were not M. Humboldt publishing his travels in Central America, we should be in a state of complete stagnation."

"These works are very important, very important?"

"They could not be more so. M. Humboldt is master of all the sciences, and when he travels, it is as if all the Academy of Science went too. It is astonishing that he has been able to collect in three years all the material on which he is working in Paris. Moreover he has adopted our country; he publishes his work in our language, he employs our engravers, our artists, our printers."

"Does he not engage in politics?"

"His reputation brings him into contact with many foreigners, who come to see him; but I have never known him to concern himself with anything but science."

"You think he is necessary to France?"

"There would be general regret if he chanced to leave us."

Napoleon called Savary, and ordered him not to put into execution the order which he had received that morning. . . . If I had appeared to be aware of the step he had taken, and had spoken to him on the subject, I should have obtained nothing."

Napoleon's predilection for science was not entirely a white passion. It was made subservient to aggressive political designs. But whatever his ultimate motives were, we must ascribe to him this merit, that he was the first great monarch to give science its true place as a factor in human life. Others before him had indeed patronized science. The Academy of Sciences under Louis XIV. and XV. was an appendage of the Court, and the Court took an interest in the little tricks and wonders of science, just as it did in Madame du Barry's Indian dwarf or a new ballet. Frederick the Great liked to surround himself with learned men such as Voltaire and Lagrange, not so much because their knowledge was of value to the State, as because they gave an intellectual luster to his Court British monarchs would sign charters allowing a Society or an Institution to call itself Royal; but it is to be feared that their interest evaporated with the ink.

These rulers cannot, of course, be blamed for not seeing beyond their generations. They lived for the most part when physical science was as yet in its childhood. But Napoleon came at a time when it had begun to prove itself, and was prepared to play a fundamental part in civilization and progress. He encouraged it to do so. His Legion of Honour was open to scientific, as well as military and political achievements. His keen and enlightened interest in the advancement of science and his respect for scientific men are in refreshing contrast to the ruthless combativeness and self-will of the rest of his career: and under his rule science enjoyed a prestige which it had no known before.

The Issues of the Convention

WHETHER or not the attendance of representatives of the pulp and paper industry at the various meetings to be held in New York during the week of April 7 will surpass that of previous years, it is difficult to say. One thing does stand out clearly and that is, the matters to be discussed will exceed in importance those of any previous year. This is especially true as regards the American Paper and Pulp Association and its affiliated organizations, the Technical Association, the Woodlands Section, the Pulp Association and the Salesmen's Association.

Of the doings of the National Paper Trade Association which meets in convention at the Waldorf Astoria on Monday, April 7, and closes with a banquet on Wednesday night, it is unnecessary to say much. This organization of the paper merchants of the country have two main divisions which embrace fine paper dealers and wrapping or coarse paper dealers. The sessions of this association are continuous and the members stick closely to business. As usual, PAPER will present a full account of what takes place at the meetings of the divisions. The banquet of the National Paper Trade Association is always enlivened by a high class vaudeville performance. Unlike the banquet of the American Paper and Pulp Association formal speechmaking is not encouraged or even permitted. Enjoyment is the order of the evening which usually closes with dancing in the main ballroom of the Waldorf Astoria.

From all that can be learned this year's meeting of the American Paper and Pulp Association will be the most important in point of action that may be taken for the reorganization of the association that has been held since the old sections were abolished and group or individual associations formed subsidiary to the main association. It has long been known to those who are close to the officers of the association that the method of providing funds for its maintenance and the prosecution of important work has never been satisfactory. Notwithstanding the adoption of specific budgets calling for definite expenditures it has never been possible to collect the entire amount that may have been pledged by vote at the annual meeting. This has on more than one occasion caused serious embarrassment to the executives in New York. It explains the suspension of certain operations of the secretary's office, especially during the past year. First the Information Service Bureau had to be practically given up and it is understood that the Woodlands Section is marked for reorganization and consolidation with the Pulp Manufacturers Association. It is on the cards that some rather radical steps will be taken during the week of April 7 to put the Association on a more satisfactory financial basis.

Meanwhile the offspring of the parent association with the exceptions noted are manifesting unusual vigor. The big problem, or "paramount issue," that of overcoming European competition is to be made a special feature of the Salesmen's Meeting. At the informal dinner and smoker to be held at the Waldorf Astoria on Tuesday evening Henry A. Wise, the well known attorney and paper expert who has figured in the biggest fights in the courts as counsel for the American Paper and Pulp Association, will talk on the plan devised by him for reorganizing the American Paper and Pulp Association so as to protect American manufacturers of pulp and paper from undervaluation, improper classification and dumping of imported paper.

The activities of the new association advocated by Mr. Wise would be under the direct supervision of legal experts. The funds for its maintenance would be derived from assessments on individual manufacturers based on tonnage and value of product. It is a mighty imposing program that has been formulated by Mr. Wise. Among other things contemplated is that of placing the office under the direction of a paper expert, the organization to include the necessary office help and experts in the Customs Service. It is a revolutionary program, differing in all its details from anything previously attempted. All of us know that attempts to reorganize and revitalize the American Paper and Pulp Association have been made times without number, the subject being a stock one for discussion at nearly every annual meeting.

It does not seem possible that Mr. Wise and his supporters can carry through so daring and novel a program as the one outlined. But the announcement of it should insure a large and interested attendance of pulp and paper manufacturers from all parts of the country and it is quite likely, as predicted by Secretary Hugh P. Baker, that the attractions of this year's meeting will bring an overflow crowd to the general meeting and banquet scheduled for Thursday, April 10.

In talks with the secretary of the Technical Association it is evident that T.A.P.P.I. is going to break all records for attendance and general interest. Stress is laid on the importance of a joint meeting of the Technical Association and the Woodlands Section for the discussion of the use of decayed wood in the manufacture of sulphite pulp. A preliminary report by J. D. Rue and associates of the Forest Products Laboratory made at the annual meeting of the Technical Section of the Canadian Pulp and Paper Association in January at Montreal showed that it was perfectly feasible to use wood that had been attacked by insects and fungi in the manufacture of pulp. Some of the investigations of the Forest Products Laboratory men which have been continued since the Montreal meeting have developed the knowledge that after spruce timber is killed by attacks of the bud worm, the tree is ripe for the growth of fungi. A peculiarity of certain fungi is that they attack only the lignin of the wood, so that such wood instead of being rendered useless for pulp manufacture is actually improved in value, giving an apparently higher yield of cellulose owing to the destruction of lignin by the fungi.

The subject of meeting unfair competition from foreign paper manufacturers will be brought to the fore at a meeting of the Paper Testing Committee of T.A.P.P.I. It has been discovered that a certain grade of paper which reaches the port of New York from German and Swedish sources as wrapping paper, duty being paid on it as such, afterwards makes its appearance on the market as greaseproof or imitation parchment. We have handled specimens of this paper and the material bears few of the earmarks of a greaseproof or imitation parchment. It has a tinny rattle that might indicate a certain amount of parchmentizing in the beater—that quality which is variously designated by the terms hydrated cellulose and oxycellulose. The ordinary test for a greaseproof paper is to form a pool on the surface of it with an oil of turpentine to which has been added an oil-soluble dye. The paper to be tested rests on white blotting paper and it is withdrawn with a sliding motion at intervals of half a minute. Good greaseproof paper will resist the action of turpentine for ten minutes. This is considered a good diagnostic test. The flame test is also used. This is applied by holding a lighted match to the under surface of the sheet. Imitation parchment will show bubbles or blisters on the upper surface under this test. The wrapping paper of foreign origin which masquerades as imitation parchment or greaseproof paper stands the turpentine test but feebly, and may stand the flame test better, as is characteristic of some hydrated papers.

Another attractive feature of this year's meeting of T.A.P.P.I. will be a report by McBain's "Committee of Fifteen on Standards." This is a joint committee of members of the Technical Association and the Superintendents' Association organized to work up standards for mill practice. It will be their duty to say how many pounds of sulphur are permissible per ton of sulphite pulp; how many pounds of soda ash and lime per ton of soda pulp; how many pounds of salt cake per ton of kraft pulp; how many horsepower per ton of groundwood as well as how many pounds of steam to dry a pound of paper.

The foregoing will give the reader a taste of what is coming during paper week in New York but there will be much more to hold the interest of manufacturers, engineers, superintendents, technical men and merchants of paper. Nothing has been said about the Paper Industries Exposition which will occupy the Grand Central Palace while the conventions are in session.

If Northern manufacturers do not wake up in time they will find new sources of competition within the Nation's boundaries. Among recent additions to the exhibits in the Paper Industries Exposition is one of papers made from Southern woods by the kraft process. This will be exhibited by the Southern Kraft Manufacturers' Association. There is a strong movement on foot for the development of paper manufacture in the Southern States, one of the best evidences of which is supplied by a projected meeting of the superintendents, managers and engineers of Southern paper mills which is to be held at the St. Charles Hotel, New Orleans, April 17, 18 and 19, for the organization of a Southern Division of the American Pulp and Paper Mill Association.

New York Trade Notes

Atterbury & McKelvey, importers of and dealers in wood pulp and other papermakers' supplies, have moved from 145 Nassau Street to Rooms 501-2 at 11 Broadway, New York, where they occupy more commodious quarters. The new telephone numbers are Bowling Green 2148 and 2149.

* * *

S. W. Dunning, agent for several paper mills, who has been located at 132 Nassau Street, New York, for a good many years, will move within the next few days to 150 Nassau Street.

* * *

About the middle of this month Fred Cherrie, of Castle & Overton, Inc., importers of and dealers in paper mill supplies of 200 Fifth Avenue, New York, will leave for Chicago where he will open a branch office for his firm. Mr. Cherrie has leased office quarters in the new South Section of the Wrigley Building, Room 464, in Chicago, and from this office he will travel through the Middle West selling wood pulp, rags, waste paper and other materials for his firm. Mr. Cherrie has been in the paper stock trade for a quarter of a century and is widely and favorably known, particularly among paper manufacturers in the Middle West where he has traveled extensively in recent years.

* * *

Charles E. Robertson, for the last five years with the Whiting-Patterson Company, paper jobbers and importers of 265 Canal Street, New York, has joined the sales force of A. R. Melker, of 110 East Forty-second Street, who represents the Ajax Paper Mills, the Franklin Coated Paper Company, the J. P. Lewis Company and the Unity Paper Mills in the metropolitan area.

It is expected that quite a large number of paper mill men who will be in New York at the time for the paper convention will be present at the annual dinner of the Waste Merchants' Association of New York, whose membership includes virtually all of the large dealers in paper mill supplies in this city, at the Hotel Commodore on the evening of April 9 in the middle of Paper Convention Week. An elaborate vaudeville entertainment is always provided at this dinner to take the place of speechmakers, and reports are to the effect that a wonderful array of talented artists has been engaged for this year's affair. Walter H. Martens, of George W. Millar & Company, Inc., 284 Lafayette Street, has charge of the tickets and reservations.

* * *

At a conference held at the Hotel McAlpin on March 19 an organization of Greater New York salesmen of paper, paper bags and allied lines was formed to be known as the Allied Salesmen Association. Officers were elected as follows: President, Edward Landers, of the Federal Match Corporation; Treasurer, Ben Kohn, of the Continental Paper and Bag Mills, and Secretary, Samuel Hoffman, of Schorsch & Company, paper bag manufacturers.

* * *

The Scandinavian Export Paper Company, of New York City, was awarded articles of incorporation at Albany several days ago to do a commission business in paper. The corporation is capitalized at $30,000, and F. Lockwood and H. Svenson were the incorporators.

* * *

R. H. Macy & Company won before the General Appraisers in a decision reducing the tariff rate on box stationery, comprising writing paper and envelopes put up in individual boxes. Duty was levied thereon at the rate of 35 per cent ad valorem under Paragraph 1313, Act of 1922, as manufacturers of paper not especially provided for. Judge Fischer held that duty should have been assessed at the rate of 3 cents per pound and 15 per cent ad valorem under Paragraph 1307 on the writing paper, and on the envelopes at the same rates plus 10 per cent under the provision in Paragraph 1308 requiring that "paper envelopes not especially provided for shall pay the same rate of duty as the paper from which made, and, in addition thereto, if lined, 10 per centum ad valorem."

* * *

Objective For Tourists

The two large paper manufacturing plants at Oregon City are both of interest to motorists travelling over the Pacific highway.

The modern mills of the Crown-Willamette Paper Company, embracing some of the finest papermaking equipment in the country are situated on the west side of the Willamette River. Extensive improvement is being made in the mill's capacity. The average number of employees for the month of January in this plant was 1129 with a loss of only 59.50 days from accidents to the employees.

Across the river on the east side is located the Hawley Pulp & Paper Company's big plant which is capitalized at several million dollars.

Here a modern concrete and steel mill to house one paper machine is now under construction. It will replace the building recently destroyed by fire.

The management is contemplating the erection of a $2,500,000 mill unit in which will be placed two large paper machines.

The mills of Oregon City specialize in newsprint furnishing much of the newsprint for the Pacific coast dailies and shipping quantities of newsprint to foreign countries. The mills also manufacture paper towels, wrappings, fruit tissues, manilas and krafts.

* * *

Takes New Position

Charles Longenecker, formerly Sales Engineer with the Bonnot Company at Canton, Ohio, has become associated with the Combustion Engineering Corporation, 23 Broad Street, New York. Mr. Longenecker was one of the first men to specialize in pulverized fuel and he has been active in this field for many years past. His efforts have been directed particularly along the line of industrial application to both boilers and furnaces. In this new connection he will be identified with the recently created Industrial Department of the Combustion Engineering Corporation. This Department, in charge of Mr. H. D. Savage, will specialize in the application of pulverized fuel to industrial work of all kinds.

* * *

Mill Founder Dies

Frank O'Neill, one of the founders of the Lebanon paper mill which began the manufacture of paper in 1892, died at his home in Oakland, California, on March 4, 1924. He was about 65 years old and unmarried. The Crown-Willamette Paper Company purchased the Lebanon mill in 1906.

* * *

Talk of Decrease

At Tacoma, Washington, one hundred and fifty lumbermen from all the producing centers of Washington and Oregon recently met in secret conference to consider the decreased price of lumber in the light of threatened overproduction. Production is given as twenty percent more than the demand. A curtailment of production was discussed at this meeting. The Northwest mills have been operating about 25 percent above normal and if they only cut the normal amount it is expected to prevent a threatened overstock.

Wisconsin Mill Notes

A wage increase of 2 to 4 cents an hour for Kimberly-Clark employes of the mills at Niagara, Wis., has been announced by company executives.

Harry Goben and Frank Soper, employees of the Fort Howard Paper Company at Green Bay, received injuries last week which resulted in their confinement in a hospital. It was the first time accidents have marred the Fort Howard record in some time. Goben's arms were crushed between two rollers, but they were not close together and his injuries are reported not serious. Soper had three fingers caught between rolls, one finger being torn off and the others crushed.

Logging will end earlier in Wisconsin this year than usual, according to reports from the woods. While there is still plenty of snow to permit getting logs out of the woods it has practically disappeared in the cities. While the season has been short, it has been satisfactory for getting out pulpwood.

Considerable mystery surrounds the death of Robert Uckermann, an employee of the Interlake Pulp and Paper Mill at Appleton. He apparently fell off his bicycle on his way home from the mill, but there was no collision and when it was found he had left the plant hurriedly without punching the time clock it was decided he had been taken ill.

* * *

Announce Wedding

The marriage of Robert J. Kieckhefer, president of the American Lace Paper Company of Milwaukee, has just been announced. The bride was Miss Grace Norton of Milwaukee, a graduate of Milwaukee Downer college in the class of 1922. The marriage took place in New York City and the couple are now making a tour of the world, having sailed for the Orient from San Francisco.

Mr. and Mrs. Kieckhefer will be gone three or four months and on their return will occupy the Kieckhefer residence at 180 Thirty-first Street.

Mr. Kieckhefer is well known in Milwaukee business circles. Before entering the lace paper business seven years ago he was associated with others in the Kieckhefer Container Company.

* * *

Short News Items

The Belhaven Pulp & Lumber Co., has been incorporated in Belhaven, N. C., with a capital stock of $100,000, by J. A. Wilkinson, W. C. Allen, Jr., and others.

The Ken Williams Thrift Savings System, Inc., has been chartered in St. Louis, Mo., to manufacture wrappers, containers, etc., for ice cream. A. D. Davidson is president and Jules R. Field is secretary.

The Nashville Pulp & Paper Co., Nashville, Tenn., is reported to have begun construction of its $1,000,000 paper mill, to be operated in connection with its $1,000,000 pulp mill.

The Gibsonville Hosiery Mills Co., Gibsonville, N. C., of which A. B. Owen is secretary, is in the market for shipping containers.

Tolan, Tellez & Prieto, Manzana de Gomez 314, Habana, Cuba, is in the market for paper milk bottles, etc.

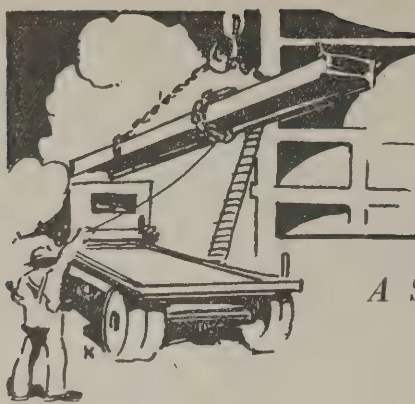
The Finance of It

In payment for the Rumford, Maine, plant the International Paper Company received $2,500,000 from the Continental Paper & Bag Mills Corporation. This amount will be used by the International company, it is expected, for the reduction of bank loans. Payable notes would thus be brought down to approximately $8,500,000. Under the terms of the sale the International Paper Company will receive about $2,500,000 additional over a period of 18 months for Rumford inventories.



CONSTRUCTION NEWS

A Summary of Vital Facts Regarding Construction, Finances and Operation of Paper Mills

Kalamazoo, Mich.—The Standard Paper Co., has acquired a tract of land and is said to have preliminary plans under way for the construction of a new mill, estimated to cost in excess of $300,000, including equipment. It will include a power house.

Waterbury, Conn.—The Waterbury Paper Box Co., Leonard Street, has filed plans for the construction of a new addition, estimated to cost about $45,000. Work will be commenced at once.

Ogdensburg, N. Y.—The Algonquin Paper Co., has preliminary plans for the construction of a new addition to its mill, to be one-story, steel and reinforced-concrete, 80x200 ft., estimated to cost $200,000, including equipment.

Franklin, Ohio—In connection with the proposed rebuilding of the portion of the plant of the Srere Pulp & Paper Co., recently destroyed by fire with loss of about $35,000, it is planned to locate the structure on a site adjoining the pulp mill on Anderson Street. Albert Srere heads the company.

Dallas, Tex.—E. C. Palmer & Co., have authorized plans for the construction of a new four-story and basement warehouse and distributing plant at 406-8 Lacy Street, South Dallas, to replace its building recently destroyed by fire. It will be 50x140 ft., and estimated to cost about $60,000. L. R. Whitson, Dallas, is architect. Headquarters of the company are at New Orleans, La.

Rumford Falls, Me.—The Oxford Paper Co., has completed plans for the construction of a new addition to its mill, and expects to commence work at an early date. It will be used for general increase in production, with reported cost placed at $175,000.

Poquonock, Conn.—The Poquonock Paper Co., recently organized to take over the local plant of the Hartford Paper Co., has plans under way for extensive operations at the mill, and is said to have preliminary plans under advisement for a number of improvements for greater efficiency in output. The new company will specialize in high grade magazine papers. It is capitalized at $300,000. George A. Leavitt is president; Edward J. Manning, vice-president and general manager; and Howard R. Manning, secretary and treasurer.

New York, N. Y.—The Columbia Corrugated Co., 50 West Twentieth Street, manufacturer of corrugated paper, etc., has leased the five-story building, 96x172 ft., on Eleventh Avenue, between Twenty-seventh and Twenty-eighth Streets, owned by the Terminal Warehouse Co., and will use for extensions in its works. The structure totals about 82,500 ft. of actual floor space, and has been known as the Keystone Building.

Cincinnati, Ohio—The Globe Folding Box Co., will commence the erection of a new addition to its plant at Mill Creek and the Baltimore & Ohio Railroad, 80x225 ft., for which a general contract recently was awarded to the Fisher-De Vore Construction Co. It will be equipped for increased production. Samuel Hannaford & Sons, Dixie Terminal Building, are architects.

New York, N. Y.—The Southern Pulp & Naval Stores Co., 42 Broadway, C. M. Thorsen, president, is reported to have plans under way for the construction of a new pulp mill on site selected in the vicinity of St. Andrews Bay, Florida, located in the northern part of the state. The initial plant will consist of a number of buildings, including power house, and is estimated to cost in excess of $500,000, including equipment. It is said that a bond issue of $1,000,000 will be sold, the proceeds to be used for this and other expansion.

Van Buren, Me.—The International Paper Co., 100 East Forty-second Street, New York, has closed down its local pulp mill for an indefinite period, and is reported to be considering plans for remodeling the plant for a paper mill, with the installation of considerable additional machinery. The plant has been running on a basis of 50 tons per day, giving employment to a working force of about 300 men. The company recently disposed of its plant at Rumford, Me., to the lately organized Continental Paper & Bag Mills Corporation, for a consideration of about $2,500,000.

Kansas City, Mo.—The Central Paper Box Co., has made enlargements in its local plant and installed considerable additional equipment, in connection with its improvement program. It is expected to double approximately the former capacity.

Detroit, Mich.—The Detroit Sulphite Pulp & Paper Co., West Jefferson Street, is reported to be planning for the installation of an additional machine at its local plant. The company is now operating a total of six machines.

Tonawanda, N. Y.—The Spaulding Fibre Co., Wheeler Street, has filed plans for the erection of an addition to its plant to cost about $125,000, including equipment. Work will be placed in progress at once.

Bridgeport, Pa.—The Diamond State Fibre Co., has completed plans and will soon begin the erection of an addition to its plant for increased output, making the fifty-eighth building at the works. It will be one-story, 60x250 ft., with reported cost placed at $50,000.

New Companies

Detroit, Mich.—The Corrugated Paper Box Co., 1230 Wilbor Avenue, has been incorporated with a capital of $50,000, to manufacture paper boxes and containers. The incorporators are Harry R. Marien, Redford, Mich.; and Charles G. Grey, 8100 East Jefferson Street, Detroit.

New York, N. Y.—The Fleming Paper Corporation has been incorporated with a capital of $11,000, to deal in paper products. The incorporators are P. B. and C. C. Fleming and J. B. Baylis. The company is represented by M. W. Beyers, 41 Park Row, New York.

Holyoke, Mass.—The Eastern Specialties Co., has been incorporated with a capital of $6,000, to deal in paper products. Charles E. Desmarais is president; and Paul N. Desmarais, 66 Beacon Street, Holyoke, treasurer.

Wilmington, Del.—The Thomas Paper Converting Co., care of the Corporation Service Co., Equitable Building, Wilmington, representative, has been incorporated with a capital of $100,000, to manufacture paper products.

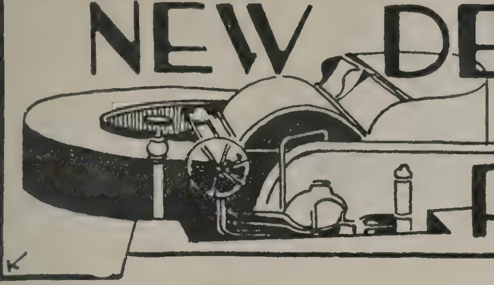
Cleveland, Ohio—The Reliable Paper Box Co., has been incorporated with a capital of $50,000, to manufacture paper boxes and containers. The incorporators are A. E. Barton and S. A. Smith, both of Cleveland.

New York, N. Y.—The Best Envelope & Paper Corporation has been incorporated with a capital of $20,000, to deal in paper products. The incorporators are S. Witte and J. Broudy. The company is represented by Shapiro & Witte, 1540 Broadway, New York.

Jersey City, N. J.—The Modern Paper Trading Co., 587 Summit Avenue, has filed notice of organization to deal in paper products. George Wallace, 110 West Ninety-fourth Street, New York, heads the company.

New York, N. Y.—The P. D. Wynne Co., has been incorporated with a capital of $20,000, to manufacture and deal in paper products. The incorporators are I. S. Wynne, M. J. Ramirez and E. C. Richards. The company is represented by Bell, Russell & McNulty, 375 Pearl Street, Brooklyn.

Huntington, Ind.—The Huntington Paper Box Co., has been incorporated with a capital of $25,000, to manufacture paper boxes and containers. The incorporators are Wilfred J. Whitelock, E. Rex and R. Eugene Lowey, all of Huntington.



NEW DEVELOPMENTS IN PAPERMAKING

Cloth Boards for Cardboard

Bolts of cloth are wound up on boards, which are known as cloth boards. A process for making an improved board from cardboard or kraft stock is described in British Patent No. 209,208. The improved form of board is more or less hollow or cellular in structure.

The board consists of a core formed of two or more separate and superimposed sheets of corrugated material, having one or more separate plain facing sheets interposed between and adhesively secured to each two adjacent sheets of corrugated material and a plain envelope or covering which is glued on to the core. The core is made of some cheap grade of fiber board and it also may be corrugated. The envelope may consist of one or more sheets which are glued together.

By using a core which consists largely of corrugated fibrous material a saving is effected in amount of cost of material. At the same time a strong structure is obtained, which it is strong enough to prevent breakage or bending beyond the proper limits, it is to a desirable degree flexible or resilient which is a decided advantage over the ordinary type of cloth board. An important feature of the process consists in the coating or impregnating some or all of the materials used in the manufacture of the cloth boards with sodium silicate (water-glass) or a suitable form of glue.

* * *

Paper and Other By-Products

Vegetable material containing pentosans, such as oat hulls, is heated with water in a digester. The first product that is obtained is furfural which is distilled off during this treatment. The residue comprises a liquid adhesive and cellulosic material which is suitable for the manufacture of paper in the place of woodpulp. In an example 200 to 225 pounds of oat hulls and 600 to 700 pounds of water are heated by steam under pressure until the temperature reaches 180 degrees C, when the blow-off valve is slightly opened so that about one pound of distillate a minute is collected. These conditions are maintained from thirty to forty-five minutes, after which the steam is cut off and the pressure in the digester is released. The residue is drained off and pressed. The extracted liquid is evaporated to adhesive viscosity in a still, and the first portion of the distillate is collected separately. The celluosic cake is washed, and the washings may be used in place of water in the initial treatment. The furfurol which is obtained both from the digestion and the evaporation is re-distilled. It is stated that the addition of small amounts of acids, acid salts, and other hydrolzing agents increases the yield of furfurol at the expense of the adhesive.

* * *

Lignin

When peat is treated with acetyl bromide the lignin and cellulose are dissolved, leaving the "peatified' portion unattacked. The process may serve as a means of studying the composition and genesis of peats. The residue from a number of different peats varies from 19 to 33 per cent, containing 1.3 to 3.5 per cent of methoxyl. Air-dried beech, oak, or fir sawdust dissolves completely in acetyl bromide, but the vacuum-dried material is more slowly and sometimes incompletely attacked. Distillation of lignin with zinc dust gives a viscous oil (120 grams from 700 grams of lignin) which when fractionated at two millimeters pressure gives fractions boiling between 66 and 280 degrees C. All the fractions contain methoxyl up to approximately three per cent, and other oxygen probably representing furan rings, up to 8.6 per cent. The highest boiling point fraction contains the least proportion of oxygen. From some of the fractions a small quantity of a new hydrocarbon $(C_6H_5)x$, which has a melting point of 210 to 212 degrees C, was obtained. For further details see *Helvetica Chimica Acta,* volume 6, pages 817 to 822.

* * *

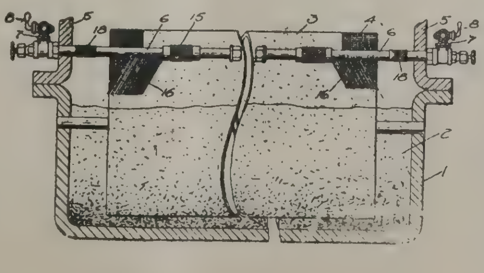
Manufacture of Self-Sizing Paper Stock

The process which is patented in German Patent No. 388,778 is concerned with a process for obtaining a paper stock which contains in addition to the regular fiber certain sizing materials which are necessary to the production of sized paper. The process depends on the knowledge that certain plants known as hydrophytes or helophytes afford a raw material for paper manufacture which contains both the fiber and the sizing agent. The process that is used for converting this material in condition ready for use on the papermaking machines precludes the digestion of the fiber but involves mechanical treatment only. The first step in the process consists in subjecting the raw material to the softening action of water and when the fiber has absorbed sufficient quantity of water to render it very soft and not liable to breaking when bent, the product is subjected to beating in the beater or treatment in an edge runner mill. It is claimed that the paper which is made from this kind of raw material is admirably well suited for making photographic films as the raw products have not been subjected to the action of chemicals and therefore there is nothing present in the paper which would react with the sensitive photographic emulsions.

* * *

Apparatus for Making Paper

The apparatus for making paper which is patented in United States Patent No. 1,485,256 consists of a combination of a cylinder, and a water pipe which is arranged parallel to the same. The water pipe, as may be seen from the diagram, has outlet openings extending at an angle and these openings are adapted to direct the water upon the cylinder and the pulp that is contained thereon in the form of a paper web. The pipe is so fixed that it can turn on its longitudinal axis.



* * *

RARE STAMPS IN WASTE PAPER

About to Be Pulped in Holyoke Mill When Traced by Ardent Stamp Collectors

A NUMBER of rare United States and foreign postage stamps which were salvaged a year ago from a mass of letters and papers carted away by a dealer in waste paper from one of the oldest firms in New York were sold at auction a few days ago and realized big prices. They formed part of what is known as the "Prosser Find," which ranks in philatelic annals as one of the most romantic finds ever recorded.

The discovery resulted from alterations made a year ago in the old building at 22 Platt Street, occupied since 1850 by Thomas Prosser & Sons, which is still there.

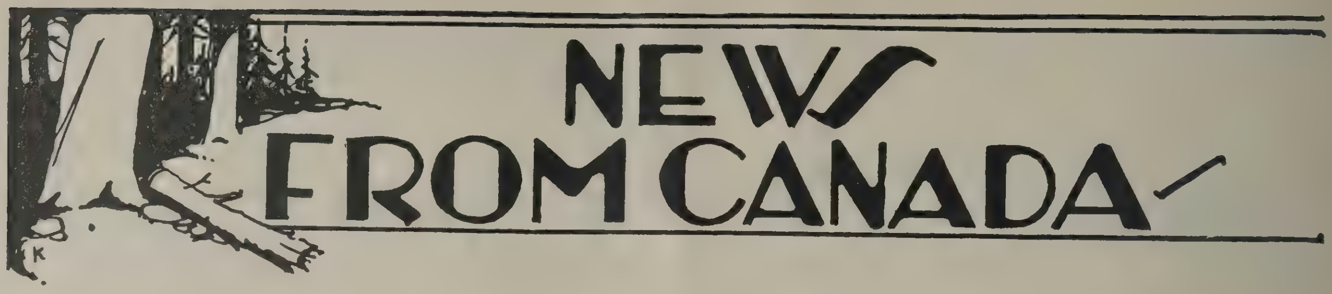
During alterations to the building, a mass of the old correspondence was carted away without investigation. Some of the musty envelopes had curious stamps on them and a few were abstracted before the junk dealer got them and sold to Nassau Street dealers who recognized their value, for the stamps were of the 5-cent and 10-cent 1847 issue, the first United States stamp issue, now worth many dollars apiece. In a few days several dealers were prospecting energetically for this philatelic mine.

One of these prospectors was Herman Toaspern. "With the aid of another dealer, who had obtained some of the stamps, he located the waste paper dealer after a long search, only to learn that the stock had been sold to a paper mill in New England.

"We went right up to the mill," said Mr. Toaspern. "The Prosser papers were mixed with a mass of other scrap paper, but we purchased six bales, and when we got them into a New York warehouse we spent several days in sorting them. The results were better than had been looked for.

"There was a splendid lot of the first and second United States issues, and among the rarities were several envelopes with Canadian and United States stamps on the cover. There were all sorts of rare railroad and steamboat cancellations and many letters had designs of early Krupp guns."

One of these rare combinations covers had a 3-cent stamp and a 12-cent of the United States 1851 issue with a 4-penny rose of Great Britain, the letter being mailed from the Bahamas on March 26, 1859, and sent via New York to Canada.



NEWS FROM CANADA

VIEWS DIFFER ABOUT WOOD EMBARGO

Commission Finds That Part of People Favor and Part Oppose

VIEWS regarding the advisability or otherwise of applying an embargo on log exports to the United States, as expressed to the royal commission collecting evidence in British Columbia and eastern Canada differ according to the particular interests of localities in which sittings are held.

On the coast where water transportation to the United States market encourages exportation of certain grades of timber the evidence was almost unanimously against an embargo. Hearings at Vancouver and in Prince Rupert brought forth vigorous testimony indicating that an embargo would be actually injurious to the timber industry of British Columbia.

But in the Interior districts where practically all logs cut are transported to adjacent lumber mills and where hopes for a thriving pulp and paper industry in the future are nurtured, testimony was quite as emphatically in favor of an embargo. It is a fact, however, that the central portions of the province stand to gain or lose little by the ultimate outcome of the present agitation for an embargo. They constitute, to a large extent, an independent unit in the timber industry of western Canada.

Two and a half hours sufficed to dispose of all testimony brought before the royal commission when it sat at Kamloops, B. C.

D. B. Johnstone, representing the Kamloops Board of Trade, submitted a resolution endorsing the principle of an embargo on raw timber. Neal Murray, a lumberman, referred to the tremendous available pulpwood resources of the district, placing these at 10,000,000 cords.

W. T. Anstie, chairman of the commission, while stating that some valuable data had been received, remarked that the district, considering its resources, had not shown an appreciative interest by offering help at the sitting.

The final meeting of the western sessions of the commission was held in Cranbrook, B. C., a lumbering and farming territory near the Alberta boundary.

Messrs. Moore and Stevens, district forester and his assistant, gave valuable information on the timber resources of the district. H. A. McKowan and S. G. Clarke spoke for the lumbermen of Cranbrook and district while W. H. Wilson and W. R. Grubb represented the board of trade. Practically all of the witnesses spoke in favor of an embargo.

As in Kamloops, evidence of timber resources and available water power were given to substantiate claims that the localities were admirably adapted to maintain pulp and paper industries.

J. F. Hutchcroft advocated embargo as a wise policy for Canada to adopt for all her natural resources. In Ontario, he said, an embargo on logs had been put into effect 20 years ago with the result that many mills had been established in the province. Formerly the logs had been shipped to the United States.

The commission has returned to eastern Canada and, it is understood, will join certain of its members who have been delegated to hear evidence in eastern districts to draw up a report for presentation to the government, possibly before the close of the present session of parliament.

BATHURST COMPANY LOSES CASE

Supreme Court of Canada Renders Decision Against It

THE Bathurst Company, pulp and paper manufacturers of Bathurst N. B., in which United States capital is largely interested, has lost its case against the New Brunswick Workman's Compensation Board, in the Supreme Court of Canada. The board appealed to the highest tribunal in Canada against a decision of the New Brunswick Supreme Court, which was in favor of the company. This litigation has been in the courts for the past three years. The company has refused to pay the assessments levied on the company by the compensation body, which total about sixty-two thousand dollars. The grounds submitted for the refusal of the company were; that the company deserved a special rate because of the operation of a compensation system of its own; that the board was extravagant, and that salaries and expenses of the board and staff consumed about forty per cent of the moneys received from levies. About six suits have been filed against the company by the board and in turn the company filed several suits against the board, so that the disputes have been continually in the courts of New Brunswick for the past three years. Indications are that an appeal to the Privy Council at London will be made by the Bathurst Company although no definite decision has yet been made according to Angus McLean, president and general manager, who is also president of the New Brunswick Lumbermen's Association, the official mouthpiece of the pulp and paper industry in New Brunswick.

The decision of the Canadian Court was somewhat unexpected as it was anticipated that this body would uphold the verdict of the New Brunswick Supreme Court. However, the court of final appeal in Canada ruled that contrary to the contention of the company it was assessable by the board. It is estimated that over $25,000 have been expended in the litigation since it was started between the company and the board.

The New Brunswick Workman's Compensation Board has been one of the heaviest burdens the pulp and paper industry has been called on to bear. Changes have been proposed by the pulp and paper interests, including the abolition of the unlimited liability clause in the law, and also the elimination of medical treatment.

POWELL RIVER PLANT TO EXTEND

Additions Valued at 4,000,000 Are To Be Made

EXTENSIONS to the plant of the Powell River Pulp & Paper Company at Powell River, B. C., having a value of more than $4,000,000, may be made this summer, it has been learned in Vancouver, and confirmed in part by Norman R. Lang, managing director of the company.

"To state definitely that we are going to undertake the work this season would not be quite correct," said Mr. Lang. "We have a large development programme under consideration and may reach a decision on it in the near future.

"We have been planning to make alterations and additions to our plant for more than a year but are not yet in a position to announce new construction work as a certainty."

The Powell River mills already are outstanding on the Pacific coast for their proportions and output.

Preparatory to increasing their manufacturing facilities the company has completed plans for increasing the height of the water storage dam at the outlet of Powell River to give more extensive water storage in Powell Lake and make possible a consequent increase in the amount of electrical energy that will be required when additional papermaking machines are installed. The dam will be raised about 16 feet.

The power project, which has been approved by the board of directors, will be started early in April and will cost in the neighborhood of $200,000.

* * *

New Sulphite Plant

Plans have been prepared and machinery ordered for a complete 90-ton sulphite pulp plant to be erected at Prince Rupert, B. C., by the Prince Rupert Sulphite Fibre Company, Limited.

It will take seven or eight months to procure the machinery, some of which has been ordered in Europe. In the meantime the site will be prepared and the buildings erected. The work on this is to be started in a short time.

* * *

Taken by Government

The Grand Falls, on the St. John River on New Brunswick, near the Main boundary, formerly held by the International Paper Company, has been taken over by the New Brunswick government which plans to develop a large hydro-electric plant there. The location was formerly under lease to the paper company, but in view of the proposed development, the lease was cancelled by the New Brunswick government.

News of Paper Week in New York

MOVIES OF HARDING TRIP

Last Trip of President to Be Depicted for First Time in New York

THE motion pictures of Alaska made by direction of President Harding while on his Alaskian Tour, will be shown for the first time in New York at the Second Paper Industries Exposition. This is one of the notable additions recorded the past week to the program for the big Paper Show at the Grand Central Palace the Week of April 7th, during the convention week of the various Paper Associations. A fine program of other motion pictures is being arranged, and among the films to be shown will be pictures portraying the manufacture of newsprint, fine papers, tissue paper, paper cups, and in fact nearly every picture extant showing paper manufacture in any of its phases will be seen during the week.

The detailed motion picture program has not yet been arranged, but it is certain that the "Romance of Paper" of the Butler Paper Corporation will be one of the features of the opening day's program.

Several additions have been made to the program previously announced for the Technical Association day at the Exposition, Thursday afternoon, April 10th. On this afternoon when the American Paper and Pulp Association leaves its program open for its members to see the Exposition without conflict with other programs of a busy week, the following among others will speak to the Technical Association members: Viggo Sahmel, of F. L. Smidth & Company on "Short Center Belt Drives" and D. E. Batesole of the Norma Company of America on "The Use of Hoffman Roller Bearings in Paper Mill Machinery."

Three notable group exhibits are among the latest to find place on the Exposition floor. The new American Association of Paper Specialty Manufacturers will have a booth as headquarters of the new organization, and during the week there will be a meeting to perfect the organization of this large group. Another group exhibit will be that of the New York Employing Printers, while the third will be a special showing by the kraft paper manufacturers.

A survey of the list of exhibitors shows that when the Exposition opens Monday, April 7th, there will be double last year's space devoted to the wide variety of exhibits. By that time all available space will have been taken, and the entire field of paper manufacture will be thoroughly covered, from the raw material situation to the use of paper in manufactured products.

The raw materials used in the paper industry will be completely covered by the various exhibits. Control apparatus for the development of increased efficiency in the mills will be particularly well shown, and specialty devices for use in unusual phases of paper manufacture.

In the field of machinery, every phase of paper manufacture will be shown with elaborate showings of every method of handling the raw material. No phase of the field will be neglected, and many of the exhibits will be of machinery in operation. Grinders, beaters, rolls, dryers and all such forms of heavy machinery will be seen.

In the displays of paper there will be some of the most notable exhibits, one big company having taken double its space of three booths used last year. A most artistic display of fine papers for social and business use will be shown, and the same will be true in the products of the paper converters, such as bags, boxes and bottles. The Greeting Card Association will have an elaborate display of its wares in this division of the big first floor of the Grand Central Palace.

Machinery for use in the conversion of paper will also feature this section, including cutters, slitters and coating machines.

All in all, the 1924 Paper Industries Exposition will be one full of interest throughout to the public, the papermaker, the printer, and every person interested in any way in this sixth among the great manufacturing industries of the United States.

* * *

SISSON TO SPEAK TO SALESMEN

Program of Unusual Interest Arranged for Salesmen's Association

WITH the securing of Francis H. Sisson, Vice-president of the Guaranty Trust Company of New York, as the speaker for its morning session, the Salesmen's Association of the Paper Industry has completed a program of the greatest interest to all paper salesmen and mill executives. The indication of a large attendance at the evening dinner and smoker are so promising that for the first time in its history the Salesmen's Association will make table reservations for the early applicants. F. N. Countiss, chairman of the convention committee, has notified the members of the Association that reservations for tables for eight or ten diners will be made no later than April 3, and smaller reservations must be in the hands of the committee not later than April 5.

The address by Mr. Sisson on "Business Conditions, Today and Tomorrow," will be the only formal address of the forenoon session, which will be devoted after his address to matters involving the future of the association, and the wider field of work which its leaders believe should be exploited.

Henry A. Wise, with an address on "The Import Problem," will be the first speaker at the evening dinner which is to be strictly informal, and he will be followed by H. V. Kaltenborn of the *Brooklyn Eagle,* who will elaborate in a more extended manner the radio broadcasting talk in "Current Events," which have made his weekly talks famous among the thousands of radio enthusiasts.

After the question box which will follow Mr. Kaltenborn's address, there will be a vaudeville entertainment, as the smoker side of the evening program, and the program of entertainers follows:

Madam Koslova—Famous Jazz toe dancer, a young beauty with beautiful costumes.

Ruth Clark—Comedienne giving the kidding songs featured at the Monte Carlo.

Maurice—Comedy Trixter.

Virginia Pearson—The Egyptian dancer who has been such a hit at the Moulin Rouge.

Ruth Wells—"The Pep Girl," with the songs and dances she has been doing all season at the Walton Roof, Philadelphia.

Sherman and Ryan—Best remembered as the features of the 1923 midwinter entertainment and supper of the New York Salesmen in honor of the paper mill executives.

* * *

AEROPLANES will soon put Boston "only forty-five minutes from Broadway."

* * *

The surest way to hold a soft job is to put a lot of hard work into it.

COMPOSER OF "K-K-KATY" TO BE AT CONVENTION

Will Lead Singing Between Courses at the Convention

AN innovation in the Forty-Seventh Annual Banquet of the American Paper and Pulp Association at the Waldorf-Astoria Thursday, April 10, will be the appearance of Geoffrey O'Hara, the famous composer of "K-K-Katy" and the pioneer among the army song leaders as the leader of community singing between the courses at the big dinner which will be the culminating feature of Paper Week.

The reservations for the banquet, are so much larger than a year ago, that tentative arrangements are already being made to prepare tables in the balcony of the Grand Ball Room, to take care of the banqueters for whom there will not be room on the main floor. Practically every reservation coming in from the big paper companies is for a larger number of seats than were taken a year ago.

That the Association's policy of making its banquet program one of "Business—Not Politics," is a factor in this increased reservation is probably largely responsible for this increased attendance. This is not entirely the cause, however, for among the meetings to be held during convention week are several of groups which have been inactive for some time past.

On Tuesday, there will be a meeting of waxed paper manufacturers to discuss a plan for reviving the old Waxed Paper Manufacturers Association, on a new basis of service to this group. The Converting Paper Mills Association will also hold a meeting on Tuesday of Convention Week. Another conference, called for the same day is that of the Simplification Committee, to discuss the simplification of paper sizes.

On Wednesday, the American Paper and Pulp Association has assisted the Bristol Board Manufacturers Association to secure a meeting room, and this group also has not ordinarily held its meetings in conjunction with the other activities of Paper Week. And still another added feature of the 1924 Convention is the meeting of the Waterproof Paper Manufacturers, who formerly had an association of their own, but which was discontinued some time ago. These various additional conferences will combine to make the 1924 convention one of the most important in the entire history of the American paper industry.

* * *

SHORT ADDRESSES TO FEATURE PROGRAM

Exposition Program of Technical Men to Be Held Thursday

ONE of the most important programs of the Technical Association of the Pulp and Paper Industry during the convention of the Association in Paper Week, will be held at the Paper Industries Exposition in the Grand Central Palace, the afternoon of Thursday, Apil 10th. The close relationship between the Exposition and the conventions of paper manufacturers being held during the week of April 7th is shown by this cooperation for the Thursday program. In addition, this afternoon is left open on the program of the American Paper & Pulp Association, so that the manufacturers who are in the city for the convention week will have one definite period in which they can visit the Exposition without interference with any of the convention sessions.

The Technical Association, known in the industry as Tappi, from its initials, will open its Exposition program at 2 P.M. with an address by Phillips Dennett of the Bird Machine Company on "The Vickery Felt Conditioner." All of the addresses will be brief, making the afternoon program one full of interest and variety. Other speakers on the afternoon program, with their addresses will be:

H. A. Linch, the Dorr Company, "The Dorr White Water Save-All."

L. M. Booth, Booth Chemical Company, "White Water Economy."

R. H. Whitney, B. F. Goodrich Rubber Company, "Special Soft Rubber Press Rolls for Paper Machines."

George H. Spencer, S. K. F. Industries, "Ball and Roller Bearings and Their Effect on the Paper Industry."

Charles A. McKeand, Seaboard Air Line, "Papermaking Opportunities in the South."

W. W. Spratt, Westinghouse Electric & Manufacturing Company, "Electricity and the Paper Industry."

Karl O. Kunde, The Electric Tachometer Co., "Tachometers."

C. S. Hardy, William A. Hardy & Sons Co. (Title not given).

A. M. Goodloe, Midwest Air Filters, "The Latest Development in Air Cleaning Equipment and Methods for testing its Efficiency."

A. E. Armstrong, Armstrong Machine Works, "Armstrong Steam Traps and Their Application to the Paper Industry; the Efficient Drainage of Paper Machine Dryers."

R. E. Wooley—General Electric Co., "Uses of Electric Flow Meters in the Pulp & Paper Mill."

Viggo Sahmel—F. L. Smidth & Co., "Short Center Belt Drives."

With the Exposition still a fortnight distant, most of the available space has been taken. Several groups are to exhibit cooperatively, and not the least interesting will be a cooperative exhibit of the Leather Belting Exchange which will operate a demonstration machine to show how belts transmit power, and the relative values of different types of belting. In addition there will be an exhibition of a leather belt running in water, and of leather belts being made endless on the pulleys. This exhibit will be purely educational, as the Exchange has nothing to sell, but will show in this manner the results of the work which has been done for several years at its Research Laboratory at Cornell University. The demonstrations will be from both the scientific and the practical standpoints.

Some exceptionally interesting motion picture films have been scheduled for exhibition during Paper Week at the Exposition, including pictures from the Forest Service, showing woods operations and problems in the getting out of raw material for the paper mills, and industrial pictures portraying the manufacture of various type of paper, from news print to the fine papers and the specialty products made from paper. As nearly as possible every motion picture showing paper mill operations will be included on the program.

A most interesting film will be that of the Snow Motor hauling huge logs through great snow drifts, making its own road as it travels, by means of an egg-shaped drum providing traction. This metal drum presses down the snow, and a spiral steel runner like an ice skate gives the traction. The motor was to have been given a public demonstration in Northern New York during the winter just ended, but there was not sufficient snow fall to make an adequate showing possible.

The manner in which the paper industry is cooperating to make the Second Industries Exposition a success is shown by the fact that arrangements have been made to include those attending the Exposition in the reduced railroad rate privileges extended to members of the paper industry attending the various conventions during Paper Week. To secure the reduced rate those coming to the convention should secure a certificate from the ticket agent on buying their tickets to New York, and these tickets will be certified in New York by Dr. Hugh P. Baker, executive secretary of the American Paper and Pulp Association, a member of the Advisory Commitee for the Exposition. Those whose tickets are so certified will be able to purchase their return tickets for half the usual railroad fare.

GIVES FACTS ON EARLY PAPER MILLS

Radsch Gives Interesting Facts Regarding History of Papermaking

PULP making from wood is a comparatively recent discovery although groundwood was used in the middle of the seventeenth century, R. M. Radsch of Kaukauna, superintendent of the sulphate mill of the Thilmany Pulp and Paper Company, said in discussing the sulphate process before the Industrial forum of the Y.M.C.A.

"The soda process was used in England as early as 1854," said Mr. Radsch, "but it was not until 1884 that Dahl, a Swedish chemical engineer, discovered the graft sulphate process. From the pulp produced by this process is made the tough fibrous wrapping paper ordinarily known as kraft paper.

"The first sulphate pulpmill on this continent was operated at East Angles, Quebec, in 1910 and in 1911 the building of the mill at Kaukauna was commenced and in 1913 it began a career of successful operation. There are now about 35 sulphate mills in America.

"Kraft can be made from any resinous wood, but the best fiber is found in our northern woods, such as spruce and fir. Many mills are being built in the south, because of the accessibility of great forests of pine and the cheaper, if less competent, negro labor. The general preparation of the wood for the sulphate process is the same as that for sulphite."

Mr. Radsch took up in detail the cooking and the intricate chemical reactions of the process, dwelling particularly on chemical reclamation. Upon the efficiency of this part of the process depends the success of the sulphate mill, he said.

* * *

Form Protective Association

The efforts of Connecticut State Forester Austin F. Hawes has brought about the organization of the Central Fairfield County Forest Protective Association. The association is the second of its kind to be formed in the state, the first being known as the Talcott Mountain Protective Association. Members of the association represent 20.000 acres of woodland in Fairfield, Monroe, Wilton, Easton, Trumbull, Weston, and Redding. Funds derived from membership fees are equalled by a like amount from the state and the whole will be used for the protection of the forests.

AMERICAN CHEMISTS TO MEET

Attendance of 1,000 Delegates Expected at Big Spring Meeting

HELIUM as an instrument of United States supremacy in aviation, progress of chemistry in this country since colonial days, development of the rubber industry, chemistry of cellulose, nationwide educational reform, and agriculture and the food supply will be stressed at the big spring meeting of the American Chemical Society, which, it is announced here by President Lea H. Baekeland, will be held in Washington, D. C., April 21 to 26.

Hundreds of papers dealing with chemistry, said to be now in its most fruitful era, will be read by distinguished scientists representing practically all the leading colleges, technical schools and universities, industrial enterprises and state and federal governments.

The papers and addresses, it is declared by leaders of the Society, will evidence amazing expansion of chemistry since pre-war days, great inroads having been made upon the supremacy formerly held by Germany in this field. Problems involving the maintenance of human life, of the petroleum industry, of enriching American farms, and of enhancing the nation's economic prosperity will be discussed at scores of sessions, to be attended by more than 1,000 delegates. The events will conclude with a spectacular field demonstration of material and equipment by the Chemical Warfare Service at Edgewood Arsenal.

* * *

Take Larger Quarters

The Gatti Paper Stock Company, Inc., large packers of rags, paper stock, etc., now located in the Fifth Avenue Building, 200 Fifth Avenue, will remove to much larger quarters in the Liggett Building, 41 East 42nd St., May 1st. The company will occupy rooms 805 and 806 and the new offices will be fully twice as large as the old quarters, thus giving the company much better facilities for conducting its rapidly growing business. Mr. Joseph Gatti, president of the company, is one of the oldest and best known men in the trade.

* * *

Gibbs-Brower at Show

The Gibbs-Brower Company will occupy Booth No. 61, at the Paper Industries Exposition, which will be in charge of Ogden Brower, Jr., assisted by Miss Vera Langfeldt. Service will be explained in connection with the buying and selling of mills in their Paper and Pulp Mill Brokerage Department, also, the "Go Between" Bulletin service to the paper and pulp mills in the disposal of, and locating of, used paper and pulp mill machinery.

* * *

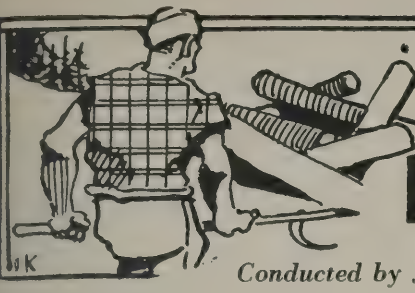
To Visit This Country

M. Dollfus, managing director of De Vains Process, Ltd., Paris, is planning a visit to the United States and will be in New York at the end of April to explain the workings of the De Vains process of pulping straw and grasses by chlorine. The process is said to be in actual use and working satisfactorily in several French mills.

* * *

Quoting New Prices

A prominent manufacturer is now quoting \$1.90 per hundred pounds on bleaching powder, carloads, f.o.b. works, on both contract and spot deliveries, and on liquid chlorine 4½c per pound in tank cars.



FORESTRY in the PAPER INDUSTRY

Conducted by J. R. Simmons, Secretary Fore ster, the New York State Forestry Association

PAPER AND PULP MEN BEFORE HOUSE COMMITTEE AT WASHINGTON

Endorse Clarke-McNary Bill and Present Statement Regarding Forestry Situation

HEARTY endorsement of the McNary-Clarke forestry bill was given before the House Committee on Agriculture, in a two day hearing, March 25 and 26, by two representatives of the paper industry, as well as others interested. R. S. Kellogg, secretary of the Newsprint Service Bureau, spoke on the opening day, as the chairman of the National Forestry Program Committee, and on the second day, Warren B. Bullock appeared with a brief statement in behalf of the American Paper and Pulp Association. This statement, brief but specific in its endorsement of the measure, was as follows:

"The Paper industry is a wood-using industry. Its permanency in this country depends upon a continuous and adequate supply of pulpwood. Of the approximately 7,200,000 tons of paper produced in the United States in 1923 over 95 per cent was made wholly or in part from wood.

"The paper industry, appreciating the great necessity for a Federal Forest Policy which will provide for adequate forest protection, management and reforestation, urges favorable action by Congress upon the Clarke bill because——

"1—The United States needs a definite and constructive forest program. This bill provides for such a program.

"2—No state of the Union has an adequate forest fire prevention system. This bill provides for a co-operative development of effective state and federal forest fire organization.

"3—The forests of the United States are being cut at least four times as rapidly as they are being replaced by natural growth or artificial reforestation. This bill would make possible commercial reforestation by the states, by the wood-using industries and by individuals.

"4—Excessive and confiscatory taxation of forest lands prevents the holding of forests or cut-over lands for successive growths of timber. This bill provides for a development on a rational system of forest taxation.

"5—The nation lacks adequate national forests to insure a perpetual supply of timber and other forest products. This bill provides for an extension of public forest ownership.

"While the Paper Industry in the United States is using only approximately 4 per cent of the annual cut of wood in the United States, yet, as a wood-using industry, it is facing the immediate and serious problem of its very existence through the present lack of adequate federal and state forest policies.

"The Paper Industry of the United States approves the Clarke bill and urges very early action upon the bill by Congress."

An important development in the national forestry legislation movement was the endorsement given the proposals of this bill by the director of the budget. The letter of the Secretary of Agriculture approving the bill, which, because of the authorization of appropriations involved was referred to the bureau of the budget, was returned with the following notation:

"Referred to the Bureau of the Budget, pursuant to Circular No. 49 of that Bureau, and returned to the Department of Agriculture with the advice that the foregoing report is not in conflict with the financial program of the president."

* * *

Speaks in New York

The New York Forest Club, composed of foresters in the paper and other industries who are located near New York, heard State Forester Wilbur of New Jersey tell of the work being done in his state, at the March monthly meeting of the club. An interesting phase of his talk was the description of plantation and other forestry work being conducted in northern New Jersey, in the hill region, and of the manner in which the fire fighting methods are being changed to make better results possible in fire fighting. He said that fires did tremendous damage each year because of existing inability to combat them in the incipient stages. Newly devised methods, if successful, will be recommended to state and private interests having forest conditions similar to New Jersey.

* * *

Timber Survey in Idaho

A survey of the forest situation in Idaho made by the state school of forestry shows that there is a total of over 84 billion feet of merchantable timber 12 inches or more in diameter in the state. The government and state own 93 per cent of the forest land, but only 30 per cent of timber, due to the fact that the best timberland is in the hands of private owners. The public timberlands include large areas in the higher altitudes where the quality is poor or the timber is in light stand.

* * *

Lumber Slowing Up

There has been a slowing up lately in the demand for lumber owing to the congested condition of the Japanese ports, and to the diminishing building activities of Southern California. Hence some of the lumber mills in Washington and Oregon are slacking up in production while others have closed down for a short time. Still others have resorted to a wage cut for the employees with in some cases resultant minor labor troubles. This condition is not expected to continue long. Most of the big lumber interests are looking forward to a 1924 large lumber production.

STATE APPROPRIATIONS FOR FORESTRY

How the Various States Are Meeting the Conservation Situation

THE men engaged in the paper and pulp industry throughout the United States have exercised more than ordinary patience in the face of often repeated warnings that the forests are vanishing and that the future of the paper industry is threatened. They have also faced indisputable facts, and unwelcome truths springing from their own and other people's investigations, with a great deal of courage and resourcefulness. They have shown a disposition to co-operate and to make sacrifices, and have many times taken the leadership in practical remedial measures.

Occasionally, individual corporations accused of undue negligence and lack of interest, have countered with the question, "What is the State itself doing to make the forests permanent, and to encourage us to carry out the kind of program advocated."

The answer is not always convincing. Even in the most progressive states forestry departments are comparatively young; practical demonstration in some states has not been in force long enough to provide adequate proof of economy; appropriations have been as difficult to wring from legislatures as special forestry budgets from private industries; taxation reform has come slowly; and the principle of free trees, or trees at cost of production, for use in reforesting unproductive areas is not yet in force in all of the states that have adopted a forestry policy.

The general situation, however, is rapidly improving, as evidenced by the report prepared by the state and private division of the forest management department of the United States Forest Service. Every odd year, corresponding with the year in which most of the state legislatures meet, it is the custom of the Forest Service to compile a statement of the appropriations made by the various states for forestry, exclusive of those for the educational work conducted by universities, colleges of forestry and schools. The report for 1923 is described by J. G. Peters of the Forest Service as a hopeful indication of the permanency of the forest movement. "Taken by and large, if the increase in the amounts appropriated is a practical measure of the progress of forestry in the states, the action of the legislatures of 1923, influenced as they were by programs of economy, may be considered as satisfactory."

Thirty-two states having forestry departments appropriated a total of $5,410,000, of which $2,441,000 was appropriated by 18 states for the purchase and maintenance of state forests, $1,727,000 by 28 states for fire prevention, $607,000 by 9 states for insect and disease prevention, $212,000 by 18 states for nurseries and planting, and the remainder chiefly for administration and publicity.

As compared with the appropriations for 1921, the net increase after deducting the item for protection against insects and diseases, which was included for the first time in the 1923 statement, was $738,000.

Two states make their initial appearance in the 1923 statement—New Mexico, with a small sum available for fire preventio,n and Alabama, with a special forestry fund of $50,000 derived, it is interesting to note, from privilege license taxes on lumbering, turpentining, and other forest industries.

* * *

Cuttings in Northeast Studied

Studies of reproduction and the behavior of trees left after cutting of the rest of the lumber are being conducted on recent pulpwood operations at Moosehead Lake, Maine, by the Northeastern Forest Experiment Station. Little windfall occurs among the trees, mostly white pine, left after logging, according to the Forest Service, United States Department of Agriculture. This is contrary to the general impression that there is a heavy loss from this cause among survivors. Of particular interest also in the course of these observations has been the striking increase in diameter growth among the remaining trees. On the plots studied a considerable amount of spruce is coming in, but nearly all of its seems to have started prior to logging. The observation at the Moosehead Lake tracts will be continued in the spring by Forest Assistant Walter Meyer, who will pay especial attention to the relation between reproduction and ground cover on these areas.

* * *

Direct Young Foresters

Two men of the paper industry will figure in some real forestry work to be done at a distance less than "forty-five minutes from Broadway," when R. S. Kellogg of the News Print Service Bureau and W. B. Bullock of the American Paper and Pulp Association, take charge of the Yonkers Boy Scouts on May 3rd in the planting of 5000 trees. New York's municipal forest movement started at Yonkers three years ago when the Scouts in a single day set five thousand trees on the cty's watershed. Today more than fifty cities have started forests. Special recognition in the way of medals and awards has been given of spruce is coming in, but nearly all of it under whose auspices the Yonkers projects and many others have been conducted. The boys who were directed by Messrs. Kellogg and Bullock last year captured considerably more than the average of prizes.

* * *

Reclaiming Forest Land

Comparison of the growth of white pine, Norway pine, and jack pine planted in the Lake States region is being made by experts of the Forest Service, United States Department of Agriculture, with the purpose of determining with which species the old cut-over forest lands of these States may be reclaimed for timber growing. On favorable soil white pine appears to be most suitable, followed by Norway pine and jack pine practically equal in value.

On the poorer, sandier sites, however, white pine must be preceded by the hardier though less productive pines. White pine plots showed an average annual production ranging from 74 to 101 cubic feet an acre at ages from 35 to 65 years, while Norway and jack pine range from 54 to 71 cubic feet. Hardwoods and aspen, though on better soils, grow much more slowly and produce at corresponding ages only from 27 to 56 cubic feet a year.

* * *

Planning New Mill

The Dunn Sulphite Paper Co., of Port Huron, Mich., is understood to be having plans prepared for a new mill consisting of a main unit with auxiliary structures equipped for an output of 15 to 18 tons per day. It is expected that the mill will cost approximately $275,000.

LEGISLATION PROPOSED IN NEW YORK

Contest Arises Regarding Preserving Forests of State

NEW YORK STATE'S constitutional prohibition, contained in section 7 of Article Seven, came in for a long and heated discussion last Tuesday before the Senate Committee on Conservation at the state capitol when the Association for Protection of the Adirondacks presented a most interesting substitute for Senator Rabenold's bill covering the rgulation of private cutting of timber within the Adirondack area.

The Rabenold bill is practically the same bill which the timberland owners opposed, and which failed of passage last year. It would prohibit the cutting and removal of timber on private land within the so called "blue line" without consent of the Conservation Commission. The new bill calls for the appointment of a special commission whose duty would be to make an investigation and report with recommendations to the legislature in 1925. The personnel of the commissin would be made up of representatives of nine interested groups, including the lumber interests, private land owners, the state colleges, the wood-using industries, the conservation commission and various associations throughout the state.

The bill does not provide that the proposed commission shall touch the question of amending the constitution in relation to use of the state forest preserve, and on this point a sharp controversy arose between the spokesmen of the Association for Protection of the Adirondacks and the spokesmen of the timberland interests. The sponsors of the bill admit that eventually the state-owned lands should be managed under forestry with a view to income, but hold that preservation must precede utilization and conservation, until the public at large has been so instructed that it can cast an intelligent vote. This, they hold, will require many years, and the public would at the present time decline any suggestion from a commission that contemplated an amendment to the constitution. On the other side of the table, it was contended that the proposed commission ought to be instructed to go the entire distance and bring in its recommendations, either one way or the other, covering section 7, Article Seven.

Those who occupied the middle ground, and the chairman of the Senate Committee, spoke for favorable consideration of the proposal, on the ground that it was a sincere effort toward co-operation, and would provide for a non-political commission to study and report on fair methods of handling the privately-owned forest lands of the state; that successful forestry practice on these lands would point the way to similar management of state lands and demonstrate to the public, in which ownership of the state land is vested, the true meaning of forestry and consideration.

Latrobe Paper Mills Resume Operations

The Barrett Paper mills, Kingston, Latrobe, Pa., have resumed operations at their local plant, following a curtailment for a number of months. During the shutdown a number of improvements and extensions have been made, and the mills are now in condition to develop maximum output under good efficiency. Employment will be given to about 60 operatives. The company is said to have orders on hand to insure production for a number of months ahead. F. M. Molson, heretofore of Peoria, Ill., will act as general superintendent at the plant; C. W. Bishop will be in charge of the papermaking department; and Paul Hilton will act as chief engineer.

Association

By J. E. WILLERT

Everybody in the world is in association with everybody else, man is a social animal and there is no one thing that affects one person that does not affect every other person somehow or sometime.

The nearer people's interests lie together the quicker they are affected by one another.

The Paper Specialty Manufacturers' interests lie very close together, they are mutual, and each manufacturer is quickly affected by the other.

When these interests are brought into close formation with a clear and certain code of action, not only will the industry be advantaged but every buyer and every user in the country benefited.

Articles of supreme need, such as paper specialties have become, should have over them a continuous watch care.

The American Association of Paper Specialty Manufacturers will give this. The first meeting will be on the afternoon of Tuesday, April 8th at the Waldorf Astoria, Room 151.

At booth No. 68 at the Paper Industries Exposition the aims and methods of the Association will be explained.

* * *

A Valuable Day

Somebody said, "Time is money," and the day you will spend at the Paper Industries Exposition will be time money well invested and pay big interest.

Stop at Booth No. 68—you'll be welcome and glad you came.

Dies Suddenly

While directing preparation of dinner Sunday evening, Mrs. Marjorie Bardeen McClellan, daughter of the late George E. Bardeen, was stricken with an attrack of Bright's disease. She was carried by attendants to her room, where she expired in a few minutes. Mrs. McClellan recently inherited a half million dollars left by her father, who expired during the winter at his winter home in St. Petersburg, Florida. Her father and husband were among the founders of the MacSimBar Paper Company here, which derived its name from a combination of the names of McClellan, Simpson and Bardeen, the organizers. The time of the funeral depends on the arrival of the second daughter, Dorothy, who was in Florida when news of her mother's death was sent to her.

Through the Middle West

SAFETY ACCOMPLISHMENTS OF WISCONSIN MILL

Kimberly-Clark Company Make the Proud Claim of Having the Safest Paper Mill Crew in the World

AN official of the Kimberly-Clark Company, Neenah, Wis., recently received a letter from a former employee, containing this paragraph:

"If there is such a thing as a safety complex, the Kimberly-Clark organization —and especially the Niagara Mill—sure has a severe case of it. I am as proud of the record Niagara has made as if I were still in the organization."

The above comment fairly reflects the spirit of safety which has taken possession of Kimberly-Clark under the direction of M. G. Hoyman, safety director.

The Niagara plant, employing 653 men, with an accident record only a few years ago of twelve to fifteen a month finished 1923 with but five accidents causing loss of time. To cap the climax, they made a straight run of 150 days (97,500 man-days) with no accidents whatever.

The management and men of the Niagara plant, in view of this record and being unable to discover a groundwood, sulphite and paper unit of like size with a safety record touching theirs, lay claim to "The Safest Paper Mill Crew in the World."

Safety Challenge Cup

About a year ago, a Safety Challenge Cup was put up by the management of the company for competition between the three major plants, namely, Kimberly, Niagara Falls, and Niagara, Wis. Niagara won the first sixty-day heat with a clean slate, then repeated the performance over a second sixty-day stretch. Niagara Falls, coming from behind, captured the third heat and followed in with a second win during the fourth sixty-day period. Permanent possession of the cup was to come with the third leg on the cup, and this Niagara, Wis., secured on the night of November 30, 1923, with a third sixty-day stretch free from the lost time injury. In recognition of this achievement, the accompanying photographs were made, and on December 9 a safety jubilee was held with a mass meeting in the auditorium of the Community House, addressed by F. J. Sensenbrenner, first vice president of the company, who made formal presentation of the Challenge Cup to the men of the Niagara plant.

Intelligent, Enthusiastic Safety Leadership

Results such as these require leadership —earnest, enthusiastic leadership. Every department of the Kimberly-Clark Company is thoroughly sold on safety. In addition to this, the foremen's organizations of the three major plants have majored on safety. The reason why Kimberly-Clark Company inter-mill contests have brought such outstanding results finds its answer in the sporting element introduced by challenges of one group of foremen to another. Too often safety contests have been superimposed by the management and, when so started, are uniformly disappointing in their results. On the other hand, when a foremen's organization, ot its own volition, issues a challenge to another foremen's organization, the matter takes on a different aspect. Pride in accomplishment asserts itself. The urge then comes from the inside out and safety becomes a vital issue.

In the olden days, a dozen accidents might occur in a month and nothing was thought of it. Today, a lost time accident in the Kimberly-Clark Company causes as much commotion as a fire.

Proper Records Help

Right psychology has more to do with accident prevention than guarded machinery. In the Kimberly-Clark Company, safety records rather than accident records are featured. The weekly chart magnifies, in terms of each foreman, the number of actual days his crew has run without injury, the total consecutive safe man-days to date, and his best previous record in safe man-days. At the top of each weekly plant safety sheet is the total days the whole plant has gone without accident.

Every red blooded foreman takes pride in seeing his safety total accumulate and by the same token has no desire to be the foreman responsible for bringing the total consecutive safe days for the plant back to zero.

By-Products of Safety

For years, the Kimberly-Clark Company has carried its own accident liability. The first result of their successful safety campaigning has been a substantial saving on this account.

Still more important, however, is the team work and morale which develops through an organization of 65 men which can run, say, 150 straight days without injury of any kind. Men take pride in their work, give more allegiance to their leadership and the reflection through the whole community life is beneficial. At Niagara, the entire community caught the safety spirit and, during the year 1923, there were fewer accidents of all kinds through the village than occurred in the mill. The two doctors would starve to death if they were dependent upon mill or community accidents for their livelihood.

Western Manufacturers Elect

The Western Paper Manufacturers' Association met in Chicago in executive session to discuss association policies and to elect officers for the ensuing year. About twenty were in attendance when the meeting was called to order at 11 a. m. in the English Room of the Congress Hotel. While no details of the matters under discussion were given out, Secretary J. L. Beck, of Chicago, stated that officers were elected for the ensuing year, as follows: President. D. C. Everest, New York City; vice president, John V. Smith, Holyoke, Mass.; secretary, J. L. Beck, Steger Building, Chicago.

McBAIN RESIGNS FROM NEKOOSA EDWARD

Will Return to Pacific Coast After July First

B. T. McBAIN, Director of Manufacturing and Assistant General Manager of Nekoosa-Edwards Paper Co., with mills at Nekoosa and Port Edwards, Wisconsin, has tendered his resignation to the President and Board of Directors, asking that it be made effective July 1st, 1924. It is understood that his three year contract is up on April 15th and that he has given the notice called for therein to be given in case either party should wish to terminate same.

Mr. McBain has taken an active interest in Association work since coming East from the Pacific Coast where he was Operating Manager of the Crown Williamette Paper Company's mills in Oregon and Washington, manufacturing over 600 tons per day of news wrapping and tissues.

He is now a member of the Executive Boards of the Technical Association. The Woodlands Section, the Pulp Section of the American Paper and Pulp Association. Third Vice-President and Member of the Executive Board of the Superintendents' Association, Chairman of the Kraft Bi-Products Association of Minnesota, Wisconsin and Michigan and Secretary of the Wisconsin Forest Products Association.

It is understood that he is going to return to the Pacific Coast, in connection with a new enterprise in his chosen line and that he will continue in the Pulp and Paper Manufacturing game, which has had his undivided attention for the past thirty years, though he has not yet positively stated what has now connection will be.

He has just recently returned from a three week's trip to the Pacific Coast where he went to investigate some matters for his present connections.

Improvements at Glatfelter Mill

Work has been nearly completed on the installation of motors in the Beater Room of the P. H. Glatfelter Co., at Spring Cove, Pa. The triple-expansion Fitchburg engine which has been in continuous service since 1887 will no longer be used. The Beaters will be driven by motors, transmitting power by means of Lennix Drives. Three new Jones Jordan engines have been installed.

Eight new dryers have been added to the 100 inch Paper Machine which has resulted in increased production.

In February a new 1000 H. P. Edgemoor Boiler was put into service. The boiler is equipped with Taylor stokers and Sturtevant economizer, the draft being induced.

A new 84" Seybold cutter has been added to the Finishing Department.

All five machines are now equipped with Bird Screens, the smallest machine having just been furnished with a Bird Screen and Suction Roll.

IMPOSSIBLE TO MAKE PROFIT

So Says Receiver for Carthage Sulphite Pulp & Paper Company

DECLARING a year's experience as receiver for the Carthage Sulphite Pulp & Paper Co. of Carthage has convinced him that it is absolutely impossible to conduct the company's business at a profit, and that losses last year amounted to $152,000 Charles E. Norris of Carthage, insisted in Federal Court at Albany Saturday, that it is to the best interests of the creditors to sell the company immediately and reiterated his request of two weeks ago to this end.

The company's output of sulphite, Mr. Norris declared, averages 45 tons a day, and the company is losing from $5.24 to $7.91 a ton. Sharp issue was taken with Mr. Norris by John S. Jackson of New York, who declared he was very optimistic as to the future of the company and believes it can be made to show a profit, provided the sum of $25,000 can be raised to finance the proposition temporarily while it is being put on its feet.

Thomas O'Connor and George E. O'Connor, of Watertown, representing the R. F. Hammond Co., Inc., declared that the Hammond Co has $100,000 worth of pulp in the Carthage Co. which, they said, is in danger of being declared personal property of the Carthage Co. and being included in the bill of foreclosure. They declared that in the interest of the company they represent, they are desirous of regaining possession of the pulp as soon as possible.

George O'Connor suggested that Mr. Jackson, who at one time was in charge of the Carthage Co., be appointed co-receiver with Mr. Norris, because of his optimistic view of the future of the concern.

Mr. Jackson said he could not agree with a statement of Mr. Norris to the effect that it cost $15,000 a month just to hold the plant. When questioned by Judge Cooper as to the reason for the poor financial condition the company finds itself in, as Mr. Jackson thinks it can be run at a profit, he replied:

"The big reason for the run down condition of the company now is the huge importation of cheap sulphite from Sweden and Norway. This condition is going to improve. Again, during the recent business slump, there have been only very small contracts. This hand to mouth method of buying made the running expenses very heavy. This situation, though is improving."

Mr. Norris further declared that operation at a profit seems impossible because of the very large mortgage. Judge Cooper advised all of the interested parties to appear in his court in two weeks. In the meantime they are all to determine their attitude on these three questions:

1. A new receivership.
2. Foreclosure.
3. Securing finances to continue operations for a time at least.

Judge Cooper indicated his opinion that it might be to the best interests of all concerned to try to secure finances to continue operations, even if a small loss was to be sustained, in the hope that eventually the property could be made to return a profit or could be sold at a better figure than now.

"Temporary financing," was the term used by Judge Cooper, rather than "new financing."

Francis F. Cullen of Watertown, appeared with Mr. Norris as his attorney.

Here Is Evidence

Evidence of the prosperity of paper mills of this section is contained in the fact that paper shipments from the St. Lawrence division of the New York Central have shown substantial increases in the last few months.

The daily paper train, which leaves the Watertown yards at 3:30 each morning, reaching Weehawken, N. J., at 4:30 the next morning, is carrying from 40 to 80 carloads of paper. During recent weeks the train has run more than 50 cars nearly every day, and at frequent intervals reaches the top figure of 80.

To provide better service to the paper manufacturers the Central established the through paper train over a year ago. It has proved its value and benefit to the paper trade. A big part of the daily shipment is newsprint made in newsprint mills surrounding Watertown and used by the big New York papers. In addition to this the train carries all other kinds of paper made in North Country mills as well as a heavy volume from Canada. At present a considerable amount of Canadian paper is being received on this division for forwarding to New York and other points.

The paper special is made up of some of the biggest and best freight cars available. Because of the nature of the product clean well-conditioned cars have to be used. Frequently the train goes out of Watertown as a double header and sometimes when the freight is heavy is run in two sections.

The train is made up in the Watertown yards, the cars being brought here from every direction in local freights during the day. Once the train is made up here it goes through without being broken until the New Jersey destination is reached.

Fuller New Super

Fred H. Fuller, of Watertown, N. Y., who was formerly superintendent of the Carthage Tissue Mills, is now superintendent of the new Columbia River Paper company's mill, which is being opened at Vancouver, Wash., a short distance from Portland, Ore. In connection with the new paper mill is a large saw mill which three weeks ago set a record by shipping 1,100,000 feet of lumber to New York City.

Before their coming to Watertown twelve years ago Mr. and Mrs. Fuller lived for four years at Camas, Wash., about 18 miles from their new home. After living here for five years, they went to Lancaster, N. H., for a year, after which they returned to Watertown, where Mrs. Fuller and her two daughters have since remained.

In the spring of 1918 Mr. Fuller left the Carthage Tissue mills and has held positions in various parts of the country in superintending and building new mills. He is also holder of a patent on Thompkins, Hawley, Fuller top felt attachment designed for making fine paper at high speed.

Last spring he returned to Watertown from Kalamazoo, Mich., where he had been acting as superintendent of the Kalamazoo Vegetable Parchment company and remained in Watertown until February 1, 1924, when he accepted a position with F. W. Leadbetter, president of the Columbia River Paper company. For a few weeks after going west, he was located at Mr. Leadbetter's Los Angeles, Cal. mill which is known as the California and Oregon Paper company.

In their travels about the country, Mr. and Mrs. Fuller have been from Maine to Japan, having spent two years in the orient setting up paper machines and instructing the natives in their use.

Mr. Fuller is a native of Massachusetts and his wife was born in California.

APPEAL FOR PAPER INDUSTRIES EXPOSITION

Advisory Committee Issues Statement Giving Facts Concerning the Exposition

IN a general letter to paper manufacturers and others interested, the advisory committee of the Paper Industries Exposition, has made the following statement:

Because of the very great importance of this exposition to the entire paper industry, the advisory committee at its meeting held several days ago recognized the necessity of paper manufacturers placing the weight of their moral and physical support behind the exposition and urge you to make an exhibit in it. Last year several manufacturers of paper placed exhibits and are again exhibiting, proving that this exposition was successful and a decided influence for them. Some of the basic and important facts which we should like you to know are:

1—The Paper Industries Exposition will do much to create business for the paper mills, the merchants and printers, and should be used to support any other campaign you are now conducting.

2—Manufacturers of paper have much to gain by talking direct to large consumers and educating them to the many different varieties and uses of their paper.

3—This personal contact will create a greater buying market for your paper; and this, of course, benefits your selling merchants.

4—It is equally as important that paper manufacturers the consuming public as for manufacturers of practically every other important commodity, the sales and distribution of which are made exclusively through jobbers. They are creating the market for the jobber.

5—The Paper Industries Exposition is a very important department of the paper industry and with your help can be made a most influential factor in educating the public to the size and importance of this industry and secure its confidence. It dignifies it in the eyes of those engaged in it and gives them an idea of its functions and methods that perhaps nothing else can.

6—The cost of an exhibit is very slight when compared with the direct benefit to yourself and the great good you can do the entire industry by supporting this exposition. The paper industry should get behind this exposition and support it enthusiastically.

7—Industrial history is replete with examples of industries which, because they have hid their light under a bushel, have made no distinct progress. The reverse is true where an industry has sought publicity through an exposition. Public confidence secured by this means of displaying the inner working of the industry has always brought prosperity and fullest cooperation.

8—Of all industries, the paper industry, surely, has much need to enlighten the public and seek its confidence.

9—We are assured of having a big attendance this year of large consumers of paper and are certain you will find the exposition to be an excellent medium for increasing business for your paper. Unless you exhibit you will never know how the exposition can benefit you. We ask you to give the coming exposition a trial and if you are not satisfied with the results obtained we will not again urge you to exhibit.

To Plant Many Trees

State Forester William A. L. Bazeley, of Massachusetts, announces that this year the state will plant 2,500,000 pine and spruce trees in the state, which is part of the program of reforestation and which will result in planting several millions of trees annually. The work will start at once.

The state has acquired over 7,000 acres of land for reforestation since December, and ultimately the state will acquire 100,000 acres. The recent purchases bring the holdings purchased for reforestation up to 72,000 acres.

This year's planting will be the first real effort on the part of the state for reforestation and the number of trees planted each year will be increased year by year, as trained men to do the work can be secured.

* * *

Fire Damages Logs

During the recent storm in Maine, a large log pile belonging to the Great Northern Paper Co. and stored at Madison, Me., caught fire from sparks from a donkey engine and the wind fanned the flames rapidly until a two hour battle by the paper company's crew, the Madison fire department and volunteers finally extinguished it. Four hours later the fire rekindled resulting in a half hour's battle. Crews were then left to guard the pile throughout the night and following day but no further trouble developed. The pile was damaged considerably. For a time the fire caused much alarm to residents in the vicinity of the pile.

FLY PAPER IN A JIFFY

We are told that necessity is the mother of invention and we have many examples that strengthen the assertion. Here's another.

It was late fall and there was a lone fly within the paper company's office. General manager Gesell had just finished reading that even one fly,—if it is the right kind,—could produce, within a short time, a small army of flies.

He had read such things before, but was not bothered about that, but this lonely fly seemed to find great delight in biting first one of his ears, then another, doing a song and dance on his neck,—the g.m.'s neck. The g.m. had spoiled a dozen sheets of good waxed paper trying to swat the fly, but had failed and was in despair for every time he tried to concentrate on business, the fly interrupted him.

The office boy who had been reading Nick Carter, jumped when the big chief let out a roar:

"Here, boy, get that dam fly."

"Dats easy, watch me."

The kid opened up a large envelope, dampened the mucilaged flap and sat down to see what Nick was doing, keeping one eye on the fly, while he extended an invitation to the fly to bite.

Within a few moments the fly settled on the mucilage end, the kid folded the envelope crushing the fly, and said:

"Its always easy to ketch 'em when you got fly paper."

Hollingsworth Report

Hollingsworth & Vose Co., of 141 Milk St., Boston, paper manufacturers, in their report to the commissioner of corporations for the year ending Dec. 31 show total assets of $2,413,179 of which $600,000 is capital, $1,324,213 is surplus, $71,000 is reserved for taxes, $8,750 is reserved for dividends and $409,216 represents accounts payable. Real estate and machinery is listed at $982,028, merchandise at $628,352, securities $394,045.

* * *

Shows Good Report

The Fort Hill Paper Co. of Boston, in its annual balance sheets, shows total assets of $141,423 of which $69,180 is represented by merchandise, $17,284 cash, $27,744 in accounts receivable and $20,388 in securities held. The company has an outstanding capital of $14,000 and a surplus of $94,467.

* * *

Minevitch Off For Russia

J. R. Minevitch, American representative of the Technical-Economical Council of the Russian Paper Industry, left New York recently, for an extended visit to Russia, where he will conduct investigations in connection with the chemical and paper industries.

To Raft Across Lake

The Consolidated Water Power and Paper Company is making preparations to raft about 40,000 cords of Canadian pulpwood across Lake Superior next summer. The wood will be transferred to railroad cars at Ashland and from there will be shipped to Wisconsin Rapids, Biron and other Wisconsin mills of the company. George C. Schneider, manager of the company's timber interests has been in Ashland making plans for the receipt and transfer of the shipment. In addition to the pulpwood it is expected that about 3,000 tons of groundwood from the Port Arthur, Canada, mill will be shipped across the lake each month during the summer.

The company is building a new dock at Port Arthur, from which its groundwood will be shipped in scows or freighters. The pulpwood is brought to Port Arthur from the forests and is there ground. Heretofore this product has gone by rail from Port Arthur to Duluth and thence to the paper mills in central Wisconsin. To avoid this long haul the Consolidated Paper Company will fit out the old commercial dock at Ashland and use it for storage purposes for the groundwood brought across the lake by scows.

The winter's output of groundwood at Port Arthur will be shipped by rail as usual as needed, but if not absolutely needed at the time it will be taken across the lake in scows during the summer months. The company probably will bring a half million dollar's worth of the pulpwood across the lake this season, not including the ground pulpwood which will be scowed across. The tugs Butterfield and Erna of Green Bay will tow a half dozen or more rafts across the lake, but the groundwood will be handled by other vessels.

* * *

Expect Big Season

The coming season at the pulp terminal at Waddington, N. Y., is expected to be largest in its history. Last year there were but two cargoes of pulp unloaded at the docks there due to the blowing down of the carriers by the wind on two different occasions.

This year it is expected that there will be at least one boat in that harbor each week. Difficulty was also experienced last year in securing boats which would carry the pulp as the company depended principally upon wild boats to do the hauling. It is said that a number of boats have already been placed under contract which insures a steady supply of the wood.

The wood is hauled by train to the mills at Norfolk, Raymondsville and Norwood and the wood will probably be handled by the local labor union the same as last season when a satisfactory price was made. In ordinary seasons about 30,000 cords of wood is unloaded at that terminal.

* * *

Move Offices

The Tileston & Hollingsworth Company, paper makers and dealers for over 100 years in Boston, and for the past 30 years located at 49 Federal street, have removed to the sixth floor at 211 Congress steet, Boston, where they have much additional floor space for their offices and stock room.

* * *

To Make Bags

The Consolidated Paper Bag Company has been organized to make paper bags at Boynton Yard, Somerville, Mass.

MODERN business development demands paper. Without paper—*abundant, varied, low-cost paper*—the great economic machine would soon have to shut down. To get paper in such volume and variety, we go back to the Forest. UNION BAG & PAPER CORPORATION does this literally—as you can see by attending

PAPER INDUSTRIES EXPOSITION
GRAND CENTRAL PALACE, NEW YORK
WEEK of APRIL 7th ▪ Booths Nos. 54 and 55

The Union exhibit—larger and more graphic than last year—will follow the path from Forest to Consumer. Logs, Lumber, Pulp, Paper and Paper Bags mark the various stages of converting spruce trees into wrappings and containers.

Of course the last stage—the Paper Bag—is the most interesting. Even those who are in a general way familiar with the paper industry will find themselves in a "new" field here. Union "Odd and Special" Bags, for instance, have found a thousand and one places to serve effectively, neatly, economically. Many of them are so refined (as to materials, formation and decoration) that they can hardly be recognized as "paper bags."

By all means see this annual Exposition. It is giving the public a new idea of the importance and development of your industry. And be sure that a welcome is waiting for you at the Union stand.

What of 1924?

In *Co-operation,* mill organ of the Kimberly-Clark Company and the Neenah Paper Company, Ernst Mahler, vice president and general superintendent, who is widely known throughout the paper industry as one of the chief founders of the Technical Association of the Pulp and Paper Industry, has an article on the business outlook for 1924 that is marked by close thinking and clear vision. It is an article deserving of wide circulation and we are accordingly glad to reproduce it herewith.

Prophets are getting more numerous every day. One can get most any kind of an opinion as to what is going to happen in 1924. From the most pessimistic, dark views, which tend to shake every one's confidence, to the most glowing, optimistic outlook, which, on the other hand, is liable to make us too easy and to slacken our efforts, because "next year it is going to be easy picking." I feel that anybody who is too strong in his conviction on either the pessimistic or optimistic side will probably have to make a great many apologies when the history of 1924 is written. I look at the year 1924 with conservative optimism, and while there are a great many sound reasons for me to take this view, I just want to enumerate a few indisputable facts.

Favorable Factors

First of all, the year 1923 has definitely put all of us "back to work." Every working man has learned that it is again necessary to give an honest day's work for an honest day's pay, and as long as this is fixed in everyone's mind we can manufacture effectively and meet all honest competition.

Secondly, confidence has been restored in the buying public, which manifests itself above everything else in the tremendous building program for the coming year. Hundreds of thousands of new homes are planned for, besides tremendous expenditures for new offices, public buildings, and factories. This means that the lumber, steel, and all other building industries will have a satisfactory year, and will give steady employment to their men.

Third, there is no one other element on which the prosperity of a nation depends as much as on the efficiency of its transportation system. The Railroads are still suffering from the inefficiency and run-down condition of their equipment during the Government's administration. The budget of the railroads for 1924 calls for expenditures for new locomotives, cars and rails, amounting to hundreds of millions of dollars.

Fourth, confidence has been restored in national advertising, and many big campaigns are planned for 1924. This means a better consumption of paper by the magazines and better sales for those who advertise, because honest advertising brings new customers.

Clouds on the Horizon

Now what are the chief factors that may dampen this fairly bright outlook for the coming year? First of all, the unsettled foreign situation. There is a great deal of weight to the argument that we cannot enjoy continuous prosperity in this great country of ours, with hundreds of millions of people, molded from the same clay as we are, in misery, unemployed, and facing starvation. It is necessary that again a balance be established which gives everyone all over this world a fair return for his daily efforts. Secondly, unfair foreign competition with money on the European continent depreciated to a point where it is practically of no value over here, but still of enough value in its own country to buy a few daily necessities. With the European workmen content to live on this low level, these countries can manufacture their goods much more cheaply than we can and, despite a protective tariff, can undersell American-made goods in our home market. The only way we can hold our own is through superior service; that means efficient manufacturing.

With Congress again in session, there is promised an attempt to make prosperity for the farmer by law, a thing which no law-making body can do. Prosperity can only come, as it is coming through adjustment to basic conditions, plus hard work.

In Wisconsin we face more legislation hostile to industry which is slowly but surely forcing our larger industrial institutions to incorporate under the laws of other states, making Wisconsin a state of branch factories. This is a subject which comes close home to every Kimberly-Clark employee who is also a loyal citizen of Wisconsin.

Our Job

What must we do in our own business family to be able to say at the end of 1924 that both management and men had a satisfactory year? We must make satisfied customers by selling them the best possible goods at the lowest possible price, that insures continuous employment, right wages, and a fair return on the investment.

To go through with this program successfully we must put all our efforts behind the waste-saving campaign. Every minute, every penny, must be made to be productive to the public, and not used to produce waste.

In our homes we must be spending our money wisely. Cut out all expenditures not necessary for our well being, but try and save, even if only a small part of our earnings.

And last, but not less important, we must further cement the friendship between management and men by giving due consideration to each other's problems.

Let us pledge ourselves to live up to this program, so that at the end of 1924 we can look in each others' eye and say, "We did a good job."

With a host of new features and all the old ones rejuvenated

CONDENSED PROGRAM FOR THE WEEK

American Paper and Pulp Association

Waldorf-Astoria, New York City

MONDAY, APRIL 7, 1924

Forenoon

10:00	Technical Association of the Pulp and Paper Industry	Room 109, 110, 151

Afternoon

2:00	Technical Association of the Pulp and Paper Industry	Room 109, 110, 151
2:30	Tissue Paper Manufacturers—Merchants Conference Committee	Room 120

TUESDAY, APRIL 8, 1924

Forenoon

10:00	Technical Association of the Pulp and Paper Industry	Myrtle Room
10:30	Converting Paper Mills Association	Room 151
10:30	Salesmen's Association of the Paper Industry	East Room
10:30	Tissue Paper Manufacturers Association	Room 110
10:30	Waxed Paper Manufacturers	Room 109
11:00	Simplification Committee	Room 100

Afternoon

1:00	Cost Association of the Paper Industry	Room 115
1:00	U. S. Pulp Producers Association	Room 112
2:00	Gummed Paper Manufacturers Association	Room 109
2:00	Technical Association of the Pulp and Paper Industry	Myrtle Room
2:30	Cover Paper Manufacturers Association	Room 110

Evening—Dinners

7:00	Salesmen's Association of the Paper Industry Dinner and Smoker	Roof Garden
7:00	Tissue Paper Manufacturers Association	Hotel Astor
7:00	Technical Association Banquet	Hotel Commodore

WEDNESDAY, APRIL 9, 1924

Forenoon

9:00	Bristol Board Manufacturers Association	Room 114
10:00	Technical Association of the Pulp and Paper Industry	Room 110, 151, Myrtle Room
10:30	Cardboard Manufacturers Association	Room 109
10:30	Woodlands Section of A. P. & P. A.	Room 115
10:30	Wrapping Paper Manufacturers Service Bureau	Tea Lounge
10:30	Writing Paper Manufacturers Association	East Room

Afternoon

12:30	Papermakers Advertisers Club	Room 112
1:00	Waterproof Wrapping Paper Manufacturers	Room 100
2:00	Glazed and Fancy Paper Manufacturers Association	Room 109
2:00	Technical Association of the Pulp and Paper Industry	Room 110, 115, 151, Myrtle Room
2:00	Woodlands Section of A. P. & P. A. (Joint Program with the Technical Association)	Myrtle Room
2:30	Writing Association—Fine Paper Division	Room 114
2:30	Writing Association—Sulphite Bond Division	East Room

THURSDAY, APRIL 10, 1924

Forenoon

10:00	American Paper and Pulp Association, General Business Meeting	Astor Gallery

Afternoon

1:00	Binders Board Manufacturers Association	Room 112

"EASTCO"
BLEACHED SULPHITE

Using "Eastco" Bleached Sulphite ourselves, testing it day by day, in producing our line of "Eastco" Fine Writing Papers, we have complete control—because we have complete knowledge—of its quality, uniformity and adaptability to the requirements of the paper maker.

"Eastco" Bleached Sulphite is good pulp; it makes good paper. Furnished in Bales, Rolls or Laps as required. Write for Samples and Prices.

LATEST MARKET REVIEW

New Company Busy

The Pacific Straw Paper & Board Company which has been organized recently is financed largely by Oregon capital. The company has purchased a 15-acre tract of land in the central manufacturing district of Longview, Washington—the city full-grown in a year. This tract has a 700 feet frontage on the Cowlitz River.

Tracks will be laid to the site chosen for the erection of the plant, construction of which will be commenced as soon as the means for transporting the building materials is in readiness.

The new firm is capitalized at $500,000 and has already sold sufficient stock to guarantee the erection of buildings to cost approximately $60,000 and to purchase machinery estimated to cost $100,000.

Daily capacity of the first unit will be 50 tons of the finished product, it is announced. The first unit will include a mill structure, rotary room, warehouse, and storage room, fuel building, engine house and office building. A part of the structures will be one-story high, the others will be two stories.

Officials of the new company are: Charles Schaub, Portland, Oregon, president; John F. Parrott, Portland, Oregon, vice-president; George Sweet, Vancouver, Washington, secretary-treasurer.

President Schaub and Secretary Sweet will be in active charge of the plant at Longview while Vice-President Parrott will remain in Portland and superintend the sales and financial office in Portland.

Studying Trade Conditions

The "All Oregon Motor Expedition" headed by Willard P. Hawley, manager of Hawley Pulp & Paper Company mills at Oregon City had left Los Angeles for the desert when last heard from. The camera man, Brownell, who started with the expedition was called back to Portland and David W. Gobbett, a man with world-wide picture making experience is taking his place.

The party will learn something of trade openings in Mexico during the two months' automobile journey from Oregon City, Oregon, to Mexico City, Mexico, and return.

Shepherd In Continental

Owen Shepherd, treasurer of the International Paper Company, has been elected treasurer, director and member of the finance committee of the Continental Paper & Bag Mills Corporation.

* * *

Give $10,000 To Church

Mrs. Frederick G. Crane, widow of the well known Dalton, Mass., paper manufacturer, Miss Rosemary Crane and Frederick G. Crane, Jr., have presented to the Dalton Congregational church a fund of $10,000, the money to be invested in a trust fund and the income to be used for church purposes.

* * *

Elect Officers

The Poquonock Paper Company of Hartford, Conn., which recently bought the plant of the Hartford Paper Company in Poquonock, a town about eight miles from Hartford, has organized with the election of these officers: president, George A. Leavitt; vice president and general manager, Edward J. Manning; secretary and treasurer, Howard R. Manning. The company is capitalized at $300,000 of which $150,000 is common stock and $150,000 preferred. The plant has water power as well as electrical power and is equipped to manufacture high grade paper.

* * *

Have Good Report

The Union Bag & Paper Corporation has issued its report for the fiscal year just closed showing net profits of $950,709, equal to $6.34 per share on the $14,977,850 capital stock after deducting depreciation, interest, etc. This compares with net profits of $1,029,865, or $6.87 a share on the stock outstanding last year.

Should Have Research Dept.

In a comprehensive survey of the Lands and Forests Department of the Ontario Government, of which he is head, with particular references to Northern Ontario potential wealth and development, Hon. James Lyons told the Legislature at Toronto last week that the time would come, if it was not yet already at hand, when the Ontario Government must consider the establishment of a Department of Research to see what could be done in the way of conservation of forestry products by utilizing by-products. He said it was the intention of the Government to work out a policy that would provide continuous supplies of raw material, not only for existing industries, but any others that the Government might approve of in perpetuity. A general survey of Ontario's timber resources would be undertaken very soon. The Minister quoted statistics to support his advocacy of a policy of the retention in Canada for manufacturing purposes of the raw materials of the forest and estimated that Canadian workmen and Canadian industries had lost untold millions in past years in permitting the bulk of the manufacturing to be done in the United States by American workmen. If Canada was going to continue to sell pulpwood to the American manufacturer, she would get in return free entry of all Canadian wood products into the United States. Hon. Mr. Lyons said that the Province of Ontario expected to save on the aircraft service of forest protection over the present system at least a quarter of a million dollars a year. By this air service the Government proposed to have patrolled 30 million acres of land never patrolled before.

* * *

Doing New Financing

Toronto and Montreal financial houses are offering an issue of about a million and a half 7 percent first refunding mortgage sinking fund gold bonds of the Howard Smith Paper Mills, Limited. The purpose of the issue is for retiring the principal sum of $200,700 of first mortgage bonds of the company's plant at Cornwall, which will be called for redemption on September 1st next; completing payment of timber limits; and to reimburse the company for expenditure on its properties, including the recent improvements at Cornwall.

* * *

To Build New Mill

A new paper mill, to cost $2,200,000, will be erected at Fort William, this spring in conjunction with the plant of the Great Lakes Paper Company, according to the statement of J. H. Black, president of the company. Mr. Black, who is a Toronto man, is in Fort William now looking over the ground. The new paper mill will employ 350 hands. The groundwood mill now in course of construction will be rushed to completion, so that everything will be ready for the reception of power which will be delivered at the mill by May 1. Raw material for the pulp mill is arriving daily. There are now 10,000 cords on the ground and 30,000 more cords are yet to come. The pulp mill will employ 250 hands.

Paper and Board

New York, April 1—On the eve of the annual gathering of paper manufacturers in New York for the annual convention of the American Paper and Pulp Association the markets are showing some signs of quieting, as well as easing. Demand during the last few days has not developed in the manner producers and jobbers would like to witness. Consumers seem to have practiced increased care in their purchasing, and the call for paper of some kinds from at least certain quarters has decreased. Possibly the forthcoming convention has had something to do with this slowing down of market activity, since it is nothing unusual for jobbers and even large users of paper to hold off temporarily in buying while waiting for their mill friends to come to town so that purchases can be made in person. It is also probable that the rather sharp decline in many grades of raw material has led to the narrower demand for paper as consumers naturally refrain from buying excepting to cover actual and direct wants when the market exhibits a downward tendency. Furthermore, there has been a general slowing down of business in various lines, and it is more than likely that the quieter position of many consuming industries has resulted in the slower demand for paper.

No changes of consequence have developed in paper prices. Quotations seem to be very well stabilized, and in spite of some appreciable declines in raw material, paper prices appear to be holding in a satisfactory manner. This is not surprising when it is considered that in the recent uptrend of raw material values prices of finished paper failed to respond and move upward with the increasing cost of manufacture. Manufacturers were hesitant about advancing prices of their own product despite the greatly increased production cost, evidently being fearful of upsetting the equilibrium of the market, and judging from the events of the last few days they were right in their analysis as raw material is now down to more equitable levels with the prices prevailing on the finished product and paper consumers have not been disturbed by any broad fluctuation in paper prices.

Newsprint continues to be the leading class of paper in point of demand. Print paper is moving in a steady way and in heavy tonnage, and mills are operating at very close to capacity and are shipping out their product as rapidly as it becomes available. Newsprint prices are firm, as would be expected with publishers absorbing supplies in such large amounts. Moreover, as the pre-Easter shopping season draws near, when department stores use increased advertising space in the daily press, consumption of newsprint is on the rise. Present indications are some new records of newsprint consumption will be established during the coming spring shopping period as already publishers in New York and other cities are adding pages to their issues as larger amounts of display advertisements are offered them.

Fine papers are in fairly good demand. In New York the feature has been the increased stocks noted of low-grade sulphite bonds, which have been offered at slight price concessions. Apparently some jobbers have loaded up with wood bonds and have pressed buyers to some extent. White bond paper of comparatively good quality has been offered freely by local jobbers at 9½ cents a pound, and colored lines at half a cent higher.

Book paper mills are moderately busy. There is a much better demand for book paper than there was recently but the movement has yet some distance to go before all the mills have sufficient business to warrant anything approaching full production. Prices are holding fairly steady though now and then sales at recessions from generally accepted market levels are reported.

Coarse papers are enjoying a fair demand, especially from the retail trade, which reflects the stocking up of merchants in preparation for the Easter trade. Tissues also are feeling the stimulation of spring demand, and are moving in larger amounts.

Mechanical Pulp

Probably the principal factor in the mechanical pulp market is that there is seemingly a plentiful supply of pulp available not alone for forward shipment but also for quick delivery. Mills are mostly reported grinding at a good rate, and producers seem to be on the anxious seat regarding the disposal of their output, with the result some rather low prices are reported figuring in transactions from time to time. Quotations on groundwood are at best on a wide scale. Domestic grinders are said to be asking $35 and higher per ton f.o.b. pulp mills while sales at much lower figures have been reported, some buyers telling of getting prime spruce groundwood down to $30 a ton at grinding plants. Imported groundwood is quoted at around $33 a ton ex dock New York, with sales at a dollar per ton or so under this price reported in some instances. Demand is nothing out of the ordinary, being principally of routine character with consumers chiefly concerned with covering their direct requirements.

Foreign and Domestic Chemical Pulp

Reports differ on the prevailing situation in chemical pulp. Some members of the trade assert that the market tone is much firmer, that sellers are holding for higher prices and that they are receiving the rates asked in most transactions, and that consuming demand is on the increase. This may be so in some instances but it is also apparent that pulp is being marketed at price concessions, and that some of those on the selling side of the trade are anxious to effect sales.

The strike of pulp and paper mill workers in Norway is said to be having a strengthening influence on bleached sulphite prices for the reason that if production continues at a standstill in the Scandinavian country the available supply of bleached sulphite may be considerably reduced. However, prices have been but sentimentally affected here thus far. Kraft pulp appears to be a little steadier in tone but actual market price levels are unchanged. Quotations ex dock New York and f.o.b. pulp mills follow:

Sulphite, foreign—			
Bleached No. 1	3.75	@	4.25
Unbleached No. 1	2.60	@	2.80
Unbleached No. 2	2.40	@	2.60

Kraft, foreign	2.50	@	2.75
Kraft, domestic	2.60	@	2.90
Sulphite screenings, refined	1.50	@	1.75

Domestic Rags

Papermaking rag values display an easing trend. That is, most grades are on the downward move, since demand from mills has subsided, yet there are some grades which are holding fairly steady in spite of the lessened call from consumers. It is the usual thing for paper manufacturers to let down in their buying in the spring as it is this time of the year when collections increase and prices recede, and indications are consumers are now purposely holding off as purchasers in anticipation of new low prices in the near future.

Roofing rags have declined to where sales of No. 1 stock at 2.35 cents per pound f.o.b. New York and of No. 2 packing at 2.25 cents New York have been reported. Some new cuttings also are moving off in price, notably blue overall cuttings, new black mixed cuttings, and unbleached muslins, which are available to mills at a quarter to a half cent per pound below recently prevailing prices. Old whites are steady, and so are thirds and blues. Prices f.o.b. New York are as follows:

New Shirt Cuttings, No. 1	14.00	@	14.50
No. 2	6.75	@	7.00
Fancy Shirt Cuttings	7.00	@	7.50
No. 1 Whites, repacked	7.50	@	8.50

Black Cotton Stockings	4.00	@	4.25
Roofing Rags, No. 1	2.35	@	2.45
Roofing Rags, No. 2	2.20	@	2.30

Imported Rags

There is a quieter demand for foreign rags, and it is noticeable that buyers are showing principal interest in spot supplies while more or less neglecting offerings for forward shipment from abroad. Prices in some cases are tending lower. Dark colored cottons for roofing paper mills are reported selling at 2.25 cents a pound ex dock New York, and blue cottons are easier in tone if not in price. Ex dock New York quotations are:

Bagging, Rope, Etc.

Despite the weakening trend in most descriptions of papermaking stock, prices of old rope are on the rise. Sales of domestic No. 1 manila rope are reported at 7 cents a pound f.o.b. New York, and even at higher prices in exceptional cases, while foreign manila rope has been sold to paper mills at close to 7 cents a pound ex dock New York. Old bagging is quiet and easy. Prices are very uncertain at approximately 1.50 cents a pound New York for No. 1 scrap bagging and 1.25 cents for roofing bagging. Quotations f.o.b. New York follow:

Gunny, No. 1	1.50	@	1.60
Foreign	1.40	@	1.50
Wool Tares, light	1.50	@	1.60
Wool Tares, heavy	1.40	@	1.60
Roofing Bagging	1.20	@	1.30
Wool Tares, heavy	1.60	@	1.75
For. Manila Rope	6.50	@	6.75
Domestic Rope	6.50	@	7.00
Mixed Strings	1.25	@	1.50

Old Paper

A very easy market exists for old paper. There is scarcely any grade that is moving in normal volume, and the trend of prices is steadily downward. In fact, prices have worked off to levels where dealers complain of the lack of profit in collecting and grading stock, which situation is probably leading to some curtailment of collections. Magazine stock is particularly weak. No. 1 flat magazines are reported offered by New York dealers at 1.35 cents per pound f.o.b. this city, and possibly at lower figures, and ledger stock has declined to 1.65 cents a pound New York. Folded newspapers are selling at 75 to 80 cents a hundred pounds New York, No. 1 mixed paper at 60 cents, common mixed paper at 50 cents, old No. 1 kraft at 2 cents, and white news at 1.90 cents per pound. Shavings are quoted at 2.85 to 3 cents a pound New York for No. 1 soft white, and 3.75 cents for No. 1 hard white shavings. F.o.b. New York prices follow:

No. 1 Hard White Shavings	3.75	@	4.00
No. 2 Hard White Shavings	3.25	@	3.50
No. 1 Soft White Shavings	2.85	@	3.00
Box Board Chips	.70	@	.75
No. 1 Colored Shavings	1.50	@	1.65
Magazine flat stock	1.30	@	1.40
No. 1 Crumpled	1.10	@	1.20
Solid Ledger Books	1.85	@	2.00
Ledger Stock	1.65	@	1.75
Kraft, No. 1	2.00	@	2.10

No. 1 Mixed Papers	.60	@	.65
White Blank News	1.90	@	2.00
Common Paper	.50	@	.55

Twines

Twine business is of strictly routine character, and, according to manufacturers, does not begin to measure up to usual proportions for this period of the year. However, quoted prices are maintained, due in large part to the firmness of raw material. Quotations are as follows:

Sisal Hay, pure	12.25	@	13.25
Manila Hay, pure	16.25	@	17.25
Sisal Lath Yarn	12.25	@	13.25
Manila Rope, pure, ¾ inch diameter	14.25	@	15.25
Hardware Rope	11.25	@	12.25
Jute rope, ¼ diam. and over, coils	14.00	@	15.00
Sail twine, A grade	20.00	@

America Light India— No. 6	14.50	@	
No. 7	13.50	@	

Chemicals

There is a fairly steady movement of papermaking chemicals. Contract buyers are taking moderately good amounts of the various items, whereas current demand is slow in developing. No changes of importance are recorded in quoted prices.

Paper Testing Methods (1922)

A large edition of this handbook for paper mill laboratories was exhausted shortly after the type had been distributed. In view of the insistent demand the Technical Association has arranged for a republication and *Paper Testing Methods* is again available at $3 per copy.

The work covers detailed procedure for microscopical analysis, physical testing and chemical analysis of the paper with descriptions of the apparatus employed.

It is the only complete and up-to-date handbook on paper testing published in the English language.

It should be in the hands of every paper manufacturer and paper dealer as well as concerns who are large users of paper.

GOOD PAPER
—GOOD RESULTS

The effectiveness and pulling power of Direct Mail literature depends entirely on the proper selection of Paper. The finest illustrations possible or the best copy cannot get your message across if produced on paper that cannot stand the strain.

FRANKFOLD Enamel

a paper built for a purpose, will answer the requirements unusually well. The extra long, firmly knitted fibres assure good folding qualities and a required sturdiness. The beautiful and uniformly smooth surface will faithfully reproduce the sharp details of mechanical subjects or the subtle shades of color work.

FRANKFOLD ENAMEL preserves that freshness and inviting appeal so essential to successful direct-mail literature.

We will gladly forward some printed specimens or blank sheets for dummy purposes.

The Franklin Coated Paper Company
Franklin, Ohio
Eastern Sales Office:
110 E. 42nd Street New York City

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not only by what you put into the equipment but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged anywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

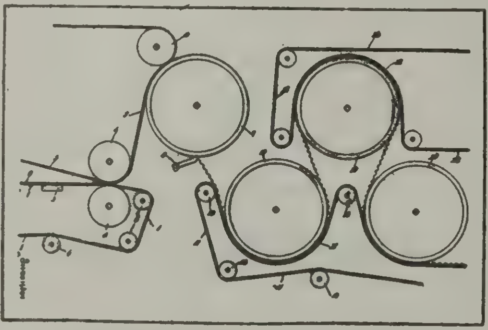
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shetting less lint than cold creped paper products.

JUST OFF THE PRESS

PULPWOOD AND WOOD PULP IN NORTH AMERICA

By Royal S. Kellogg

Author of "Lumber and Its Uses," "The Cost of Growing Timber," "The Timber of the United States"

270 Pages 87 Illustrations

A graphic presentation of one of the vital economic problems of the day—the securing of an adequate supply of paper.

This book is of special interest to everyone connected with the pulp and paper industry and equally so to all users of print paper. It points out clearly what must be done to develop sufficiently our supply of pulpwoods.

States in 1923 over 95 percent was made wholly or in part from wood.

"The paper industry, appreciating the great necessity for a Federal Forest Policy which will provide for adequate forest protection, management and reforestation, urges favorable action by Congress upon the Clarke bill because——

"1—The United States needs a definite and constructive forest program. This bill provides for such a program.

"2—No state of the Union has an adequate forest fire prevention system. This bill provides for a co-operative development of effective state and federal forest fire organization.

"3—The forests of the United States are being cut at least four times as rapidly as they are being replaced by natural growth or artificial reforestation. This bill would make possible commercial reforestation by the states, by the wood-using industries and by individuals.

"4—Excessive and confiscatory taxation of forest lands prevents the holding of forest or cut-over lands for successive growths of timber. This bill provides for a development of a rational system of forest taxation.

"5—The nation lacks adequate national forests to insure a perpetual supply of timber and other forest products. This bill provides for an extension of public forest ownership.

"While the Paper Industry in the United States is using only approximately 4 per cent of the annual cut of wood in the United States, yet, as a wood-using industry, it is facing the immediate and serious problem of

"The Paper Industry of the United States approves the Clarke bill and urges very early action upon the bill by Congress."

Visited Interior Minister

George C. Carruthers, Toronto, president of the Canadian Pulp and Paper Association, was in Ottawa last week, as part of a delegation that waited on the Minister of the Interior on the subject of improving the Forest Products Laboratory at McGill University, Montreal, to the end that the research work of the Association may be put on a more effective basis. A number of the executives of the larger pulp and paper mills were also included in the delegation which were assured of sympathetic action by the Government.

Held For Conspiracy

Edwin R. Mosher and Maurice Deverich, members of the paper jobbing firm of E. R. Mosher & Company, formerly at 52 Vanderbilt avenue, New York, were held in $1,000 bail each last Friday for trial in Special Sessions after a hearing before Magistrate George W. Simpson in the Commercial Frauds Court on a conspiracy charge. Assistant Distict Attorney Harold H. Spellman announced that the case was considered a test of its kind and that "the result of the trial in Special Sessions would be awaited with much interest both on the part of the prosecuting authorities and business men in the State."

It was alleged that E. R. Mosher & Company over a period of three years bought paper from other firms and then sold it to the Interstate Pulp and Paper Company, by which they had been employed many years before, at prices lower than they agreed to pay for it. Assistant District Attorney brought out that the partners declared dividends and awarded each other commissions when there was a deficit and they put off creditors by refusing to show their books. In his decision Magistrate Simpson said: "The elements of the crime of conspiracy are clearly indicated in the testimony. There is a reasonable and probable cause for me to believe that the crime charged has been committed and there is sufficient cause for me to believe the defendants guilty thereof." Messrs. Mosher and Deverich did not offer any defense.

GOVERNMENT BIDS

Treasury Department,, Bureau of Engraving and Printing, Washington, D. C., March 1, 1924. Sealed proposals are invited to furnish Dextrine, Oils, Textiles, Dry Colors, Paper Boxes, Paper and Check Paper, during the fiscal year beginning July 1, 1924. The right is reserved to reject any or all bids or parts of bids. Samples of Dextrine, Oils, Textiles and Dry Colors must be received at the Bureau of Engraving and Printing not later than 2 P.M., Wednesday April 9, 1924. Samples of Paper Box Blanks, Paper and Check Paper, must be received not later than 2 P.M. Monday, April 7, 1924. Blank forms with specifications for proposals, giving dates on which the bids for the several schedules will be opened, and further information will be furnished on application to Paul E. Twyman, Assistant Director.

TREASURY DEPARTMENT, Office of the Secretary, Washington, D. C., March 15, 1924. Sealed proposals will be received at this office until 11 o'clock a. m., Wednesday, April 16, 1924, from manufacturers of bond, bank-note and other fine papers for furnishing bank-note paper of the highest quality containing the distinctive feature now in use by the Department, for the printing of United States currency and public debt securities, national and Federal reserve bank-notes, Federal reserve notes, etc., for the fiscal year beginning July 1, 1924. Blank forms for submitting proposals, with specifications and further information will be furnished manufacturers who intend to bid upon application to this office, where samples of the paper required may be examined. A. W. MELLON, Secretary of the Treasury.

A Few Stray Thoughts

IT is Paper Week. The world revolves around paper. Everybody is talking paper. The manufacturers of paper are commingling in a happy mixture of business and pleasure. The serious problems of the year are merged into the joys of good fellowship; sociability is intertwined with business.

* * *

In the Grand Central Palace throngs are crowding about the attractive booths of the exhibitors, absorbing education, partaking of entertainment, enjoying themselves. Paper and pulp men join with laymen in the engrossing contemplation of the displays.

The Waldorf-Astoria is the Mecca of the makers of paper, large and small, important and unimportant, rich and poor. Hands are clasped in the first grip since last year. Shoulders are slapped, smiles are free and expansive. Tongues are wagging freely. Laments are few and smothered at birth. Optimism is in charge. Life is buoyant, carefree, joyful. The restraints of the year are tossed off by the perennial youths of the paper industry, as by colts. A new vision appears. In the new program of the American Paper and Pulp Association is hope, paliptant, exuberant hope. The jaded souls of the paper industry are being recharged for a new year. The bugaboo of foreign competition doesn't look quite so monstrous, the forests do not seem to shrivel quite so rapidly. And the spirit of the annual convention goes back home with the boys from all parts to accompany them through another year.

* * *

PAPER welcomes every last mother's son of the paper industry at this convention. Representatives of the magazine will be glad to see everybody at Booth 83 at the Grand Central Palace. A room will always be open for you at the Waldorf-Astoria. Do not hesitate to use either.

Indications at the opening of the week are that it will be the greatest convention in the history of the associations. Plans that verge on the revolutionary are being broached in some of the smaller associations. The industry is in a state of flux. One or two new associations are expected to spring into life during the week. There will be a reconsecration to the spirit of broad, considerate co-operation that will work to the advantage of the industry as a whole. It is a healthful sign. Realizing that all must stick together, obliterating the prejudices and petty trifles of cut-throat competition, the executives of the mills of the country come to the convention this year with a higher regard for their fellow manufacturers and a clearer conception of the duty of the industry as a whole.

* * *

The moot question is the Wise plan to combat European competition. The entire industry almost breathlessly awaits the outcome of the week.

* * *

But keep the good-fellowship uppermost. The doldrums must not have a place at the annual convention. Let joy be unleashed, but let the cold logic of business have its fair place during the week, for upon it rests the coming year's prosperity.

To Reorganize Financing of Association

Startling Changes Expected at this Year's Convention of American Paper and Pulp Association

RECOMMENDATIONS for a general reorganization of the methods of financing the Ameri- an Paper and Pulp Association, a roposed revision of the association's rogram of activity, and a statement hat the association is for the first time n years free of indebtedness and eady to proceed under a budget of nown income, will be an important eature of the forty-seventh annual onvention of the association, on hursday, April 10. The recommenda- ions will be made by a joint report of wo special committees which have een working for months on the fu- ure activities and financing of the entral association of the paper indus- y. The finance committee was un- er the chairmanship of Walter J. aybold, former president of the as- ociation, and the committee on activi- es and program under Norman W. Vilson, vice-president. The report ill be submitted for action at the renoon business session on Thurs- ay.

The committee completed their ork during the past week, and the ecommendations are now being put form for submittal to the associa- on membership.

While this work has been going on, e plans for the more routine events convention week have been pro- eding without interruption, and it w seems certain that there will be wards of 1,000 persons in attend- ce at the annual banquet Thursday ening.

The forenoon program of discus- ons has been completed, and the ree main groups of the industry ill be discussed by the following en:

ulp—E. W. Kiefer, Port Huron Sulphite Pulp and Paper Company.
Coarse Papers — C. R. McMillen, Union Bag and Paper Company.
Fine Papers—Charles McKernon, B. D. Rising Paper Company.

Another interesting feature of the program of the day will be the president's luncheon at noon of convention day, when seven of the eight living former presidents of the association will be the guests at a complimentary luncheon. The only missing one of the group will be E. C. Rogers, who was president from 1888 through 1889, and who feels that he can not get to New York this spring. The luncheon will be devoted to reminiscences of early days in the paper industry, as several other men who have been ong in the industry will be among the guests.

The program of convention week indicates a considerable revival of interest in American Paper and Pulp Association work by groups which have not been working closely with the central association for some time past. The Converting Paper Mills Association has closed arrangements for cooperative work with the American Paper and Pulp Association, the new Boxboard Manufacturers Association has been accepted for membership as one of the affiliated associations, and the Waxed Paper Manufacturers have scheduled a meeting which is likely to be followed by the reorganization of this group with considerable new strength added to the old time membership. The Paper Specialty Manufacturers will meet during the week, for organization, and the Bristol Board Manufacturers Association, though not affiliated with the American Paper and Pulp Association has been aided in arranging a meeting during the Paper Week.

The Gummed Paper Manufacturers Association will consider an advertising campaign for the promotion of the use of gummed tape for sealing boxes and several other groups will take up business of interest to manufacturers of various grades of paper.

Meanwhile the salesmen are preparing for a busy day on Tuesday, as the big opening event of paper week. Ticket reservations have been coming in rapidly for the dinner and smoker, already four tables of ten guests have been reserved. Chicago is sending a dozen or fifteen representatives, the Miami Valley a proportionate number, and New England will also be represented.

On Wednesday, the Woodlands Section will hold its meeting, and will have two main subjects for discussion. One will be the problem of forest fire control, and the discussions will center on how the owners of pulpwood lands can cooperate with Federal and State officials, and lumbering organizations for a joint war on the fire demon. The other subject, which will be discussed in joint session with the Technical Association will be pulpwood decay, the Woodlands Section meeting taking up this subject from the woods side, rather than from the standpoint of the mill. The discussion will involve the operations in the woods, the work which may be done by the timber cutting crews in getting out wood which is partially decayed, and the cooperation of the woodlands operations with the mill in not taking out wood which is decayed to the point where it can not economically be utilized in the mill. Speakers on this subject will refer to the laboratory side of the problem, but the woods men will be most interested in the field work and its relation to the studies, made of utilization by laboratory specialists of the Forest Products Laboratory.

Simplicity In Research

A Study of Beater Action or Effect of Beater Roll on Pulp—Control of the Variables of Beating and Measurement of its Progress by Use of Beater Drag

By **ARTHUR B. GREEN, A.B., S.B.**

Manager at Middletown, Ohio, for the Nashua Gummed & Coated Paper Company

THOSE who attended the Technical Association dinner held on Mt. Tom, near Holyoke, Mass., in the fall of 1917 will remember the delightful Scots burr of George Carruthers when he told of the two Scotsmen rowing across the lake. A storm arose, the wind blew, the rain descended, the waves began to break over the gunwales, the shore was hidden, and stalwart Scots courage began to weaken. Conscious that their attendance on church had not been such as to entitle them to much consideration from on high, they nevertheless, in final desperation, decided to pray; and they organized it so that one should row the boat while the other got on his knees as best he could under the circumstances. He was about to pledge them both to a life of devotion and piety, "If, Oh Lord, ye'll only breng us oot o' this, this ainct!"—but suddenly the man rowing looked around, and then admonished, "Hold on a wee, Sandy. Dinna commit yersel, I think I can see land!"

What a Laboratory Report Reveals

Send out to a consulting laboratory and get a report on what is the effect of the beater roll on the pulp, and you obtain a result that is at once attractive and enthralling; microscopic studies, photomicrographs, dissertations relative to the disputed points in the chemistry of cellulose, exhaustive speculations as to the nature and origin of "slime," arguments pro and con on the point of a proper scientific name for "slime"—whether it should go by the name "hydrocellulose" or "hydrated cellulose"—elaborate tracery of the evolution of the fiber from the wood or other plant, and the influence of the species on the tendency to "hydrate," discussion of the effect of sizing, loading, coloring, and the influence of alum on all these, a wonderful picture with the charm of being absolutely harmless. With the report in, there is nothing that can be done about it. That is a point of satisfaction. The mind has been greatly stimulated, and at no risk. No new duties are added either to the beater room crew or to the management. The very complexity of the report tends to give reason why things-as-they-are are about as good as can be expected. It is always something of a relief to feel that nothing more may be expected of us, and we can settle down and wait for somebody to step in and hand us control of our operations packed in a box and guaranteed or money refunded. "Dinna commit yersel', Sandy!"

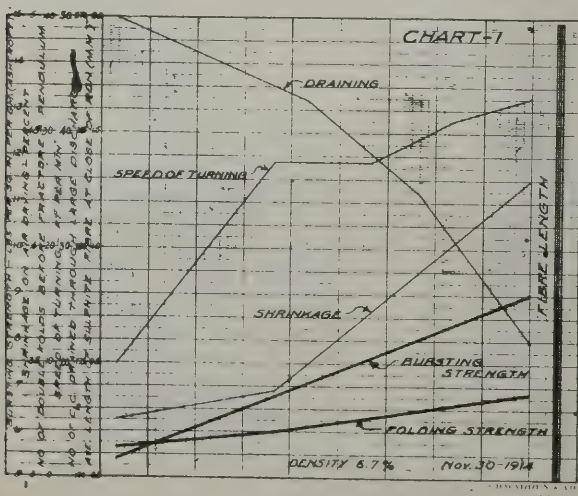
We need hardly be disappointed, however, if such attitude of mind is slow in bringing to us the coveted control of our operations. Control is in two parts:—First, control of processes, and secondly, control of men. The first is material and technical, and the second is human and moral. One without the other is scarcely worth its cost. But of the two, the greater is the human and moral side of management.

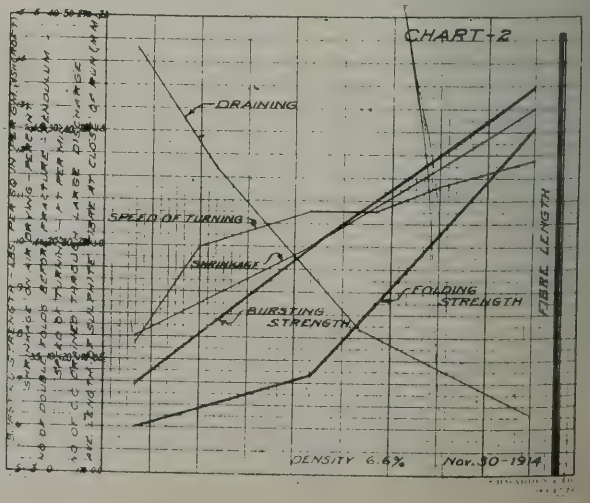
Action of the Beater

Fortunately there has been lately a revival of interest in the problem of beating. Coming at a period not marked by industrial prosperity, in which mental lethargy has been the habit and "normalcy" the watchword, special credit is due Dr. Sigurd Smith, the distinguished Danish engineer who gave the subject study, and to the Royal Society of Arts in England, who gave him their enthusiastic hearing and broadcasted his work with dignified publicity. No person who hopes for a better era in the management of paper mills can afford to neglect his book, *The Action of the Beater,* as published by the Technical Section of the Papermakers' Association of Great Britain and Ireland.

Dr. Smith's Theory of Beating

Dr. Smith's approach to the problem is from an analysis in detail of the mechanical action between beater roll, bedplate, and the fibers in the stuff. Without stating it, the assumption evidently is that all beating takes place where and when the roll flybars pass over the bars of the bedplate. Dr. Smith develops through experiment and calculation a new theory to explain this action, and on this theory has based a method of working up the design of the beating engine. It is indeed a refreshing accomplishment, for paper manufacturers have been intermittently stormed for years by persons who had new designs of beating equipment to sell, which had been developed wholly out of hand, as the result of a "hunch," without any backing in analysis or calculation, and such salesmen have proverbially been bold if not foolhardy in their promises of what could be done with their innovations. As against the many thousands of dollars that have been spent unwisely on beaters that had been actually built and sold before any engineering knowledge had been developed about them, there is much to be said for the work of an engineer such





as Dr. Sigurd Smith, who shows the possibilities that lie in the problem for engineering.

Lack of Data to Determine Speed of Roll

A great paper mill of long standing, which had grown piecemeal from small beginnings, contained no less than five different types of beating equipment, all of which were employed for similar work, and the management had no data on which to determine the right speed of roll for any of them. As for the rest of the information that should be summed up in an intelligent design of beaters, they knew certainly as little. And that was typical of mills everywhere, in this country and abroad, ten years ago. The shame is that engineering development in other fields has not penetrated more into this field, and that what was typical of mills ten years ago is still typical today.

Ten years ago, in the mill referred to, as a result of some engineering work done by methods now about to be described, the most advantageous roll speed for one of these types of beaters was found to be radically different from the speed recommended by the builder. When that speed had been found and applied, a net saving of $60 a day was made on a single paper machine. The mill housed eleven other machines, and the cost for research did not exceed $700. That was a single by-product of an effort to control the operation of beating. The entire cost of that effort could have been charged against this one advantage, and a profit shown of several hundred percent even if no control of beating had been gained. Such are the opportunities. Consider also, in passing, that the factor of roll speed is only one of the many factors that must be accounted for in preparing the design for a beater for a given class of service. This multiplies the opportunities.

Where Beating Action Takes Place

The assumption that all beating action takes place where and when the roll flybars pass over the bars of the bedplate does not find easy support. From that point of view, the tub is only a means of returning the stuff to the roll and bedplate. Multiple rolls would increase the beating capacity in direct ratio with the number of rolls and bedplates. Carrying the reasoning one step further, the ideal beater, if this assumption were true, would be a series of elements performing the work of roll and bedplate together with means of passing the stuff from one to the other by gravity, so that the travel from one element to the next would be as short as possible.

This has been tried numerous times. It is a speculation to which the mind naturally reverts. Yet it has never been possible to set up by such means the same action that takes place where the beater tub is employed and the stuff comes repeatedly around under the roll. This is particularly evident where fine papers are made. Difficult as it may be to describe it, the tub seems to have a function.

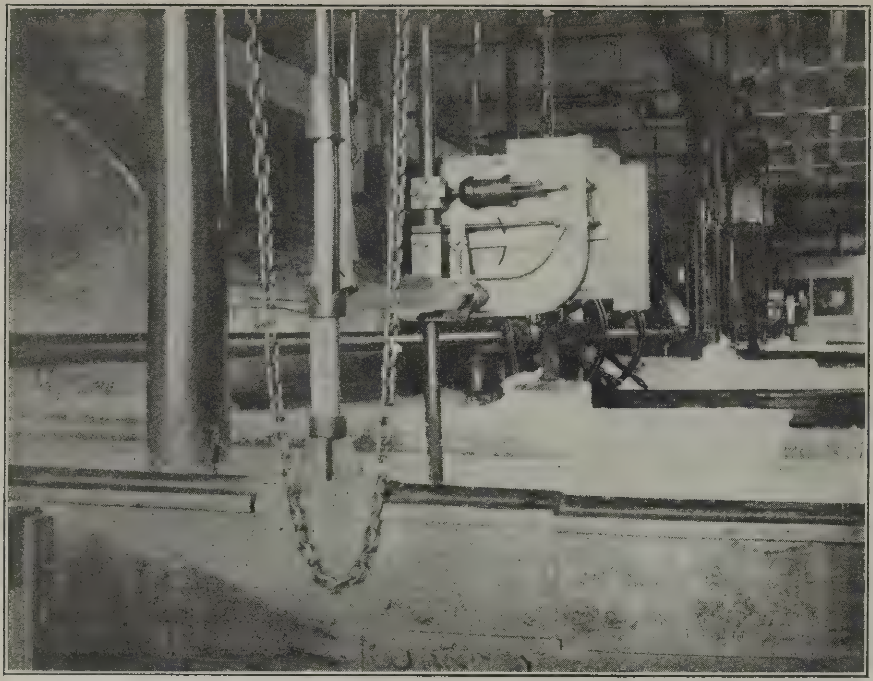
Charts That Show Beating Action

Moreover, if this theory were true, then it must follow that the papermaking characteristics of the fibers would be expressed by the nature and extent of the damage done to them in beating. Fibers from a given pulp which had been much shortened, for example, must be found to possess certain papermaking characteristics distinguishing them from other fibers from the same pulp that had been shortened less. On the other hand, fibers which come out of the beating process at about the same average length should not be expected to show radically different properties. Some interest, therefore, attaches to the accompanying charts, taken from experiments made by the writer in 1914. Methods had then been fairly developed for expressing the papermaking characteristics of a batch of stuff under treatment in the beater, independently of the subsequent action of Jordan or paper machine, and the curves shown on Chart 1 and Chart 2 represent the changes that took place in shrinkage, bursting strength, and folding strength, during the period of beating and prior to the addition of alum. The curve marked "Draining" represents a measurement of slowness by the Schopper-Riegler principle. At the right of each chart is seen drawn to scale the average fiber length after beating. Both runs were made on the same day, with the same furnish, and the density of furnish was the same within one-tenth of one percent. These charts were published in PAPER in the Annaul Convention Number, February 23, 1916.

The roll action in these two runs was radically different. So different was it, that although the roll speed was the same and the density of furnish almost identical, yet even the speed of turning in the beater (speed of travel might have been a better term) was much different, though starting from the same point in each run. One run gave a greater development of strength, a less speed of travel, and a distinctly slower stuff (Chart 2), whereas the average fiber length at the end of the run was 1.93 mm. as compared with an average fiber length at the end of the other run (Chart 1) of 1.98 mm. Not what could be termed a significant difference in fiber length. The two runs represent radically different grades of paper with apparently little difference in the extent of actual physical damage to the individual fibers.

TAKING A DRAG READING

Each beater is visited once every twenty minutes and the actual reading is compared with the prescribed. The beater roll is then adjusted in accordance with this comparison



BEATER DRAG IN WORKING POSITION

Another case similar in character is to be found in Volume II, page 8, of the Proceedings of the Cumberland Institute for Paper Perfection, a now abandoned organization of men at the Cumberland Mills works of the S. D. Warren Company. For a few years very interesting gatherings were held for the exchange of thought and experience in the making and selling of high grade book papers. The question before the house on the evening of September 19, 1913, was, "How important is it to the formation of the sheet to shorten the fibers?"

Long Fibers and Soft Sheets

A certain grade of cover paper was running over one of the machines on a day previous to that meeting. The sheet was too "soft," in the judgment of the superintendent. His diagnosis was that the stuff was too "long," and he gave orders to set up the Jordan and shorten it. As a result the sheet was rendered "harder." It went together better on the wire. The superintendent had accomplished what he intended. Samples of the paper made before and after this "shortening" of the fibers were brought to the gathering, and all correctly agreed, after examining them in code, which was the "soft" sheet and which the "hard." Samples were also prepared for the microscope from the stuff as it passed from the Jordan, some taken before the "shortening" and some after. These were numbered in code and thrown on a screen by a projecting lantern so that all present could see. The gathering comprised practically everyone in that large organization who was competent to have expert opinion on papermaking matters. They were to choose which slides represented the "long-fibered" stuff, and which the "short-fibered." They agreed that there was small choice, but after long and careful consideration they finally chose for the "long-fibered" stuff the sample that had been taken subsequent to the "shortening."

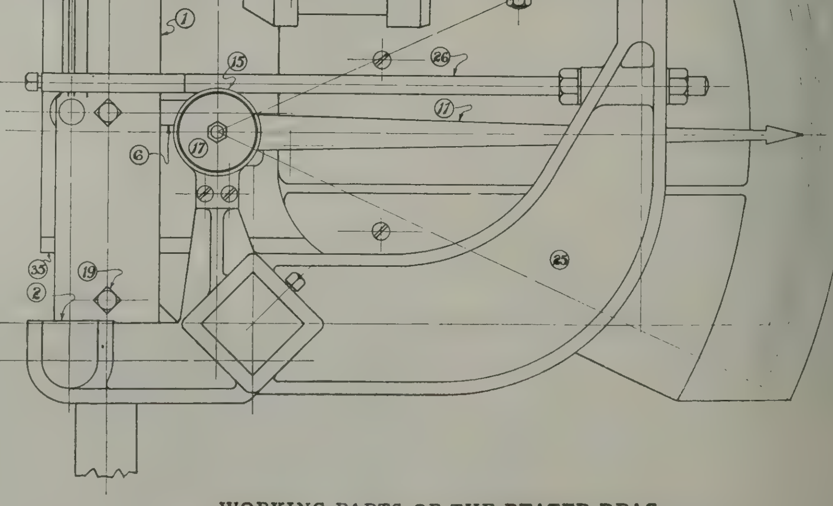
Determining Conditions in the Control of Beating

Generalizing from data such as this must be done with regard to the classes of fiber in question. In older times, and even now, when rags and other long-fibered stuffs are used, certainly some shortening of the individual fibers had to be accomplished in order to make paper at all; hence the tradition which draws contrasts between long and short stuff. Not so, however, with chemical woodpulps, or groundwood. In this class of pulps the individual fibers are short enough to form into any grade of paper without being further shortened by beater action and as we have seen, the conditions which determine the papermaking characteristics of the stuff are in this class of pulps other than conditions of fiber dimension. It is the study of these determining conditions that may lead to control over the variables of beating.

Attributes of Paper

Now, there is a choice in line of attack. We may plunge headlong into the maze of analytical chemistry, dealing with the more or less vague changes and reactions that go on during beating, or into the equally baffling maze of analytical physics, dealing with the unseen minutiae of the separate fibers during their career under the action of roll, bedplate, and tub; and in both these cases, after the plunge, we have become blinded to the very objects for which beating is carried on. I think that most studies of the problem have been undertaken in one or the other of these wrong and impractical ways.

The object of beating is to accomplish certain results which are manifest in the final product, the paper. Paper is a fabric made and used because of fairly simple physical attributes, as e. g. thinness, smoothness, color, resistance to moisture, bursting strength, folding



WORKING PARTS OF THE BEATER DRAG

(2) Main Bearing
(17) Indicator Bearing
(6) Connecting Bar
(11) Indicator
(28) Spring Housing
(38) Automatic Recorder Housing

endurance, tearing strength, freedom from curl, opacity, and the like. These are physical properties. Paper is a physical product, no less than wood, steel, or glass. We have our problem then in two parts. On one side lie the complexities and mysteries of the beating operation, and on the other lie the simple requirements paper is made to fulfill. *When we have found the relation between the two, we have a practical solution of the problem of control of beating.*

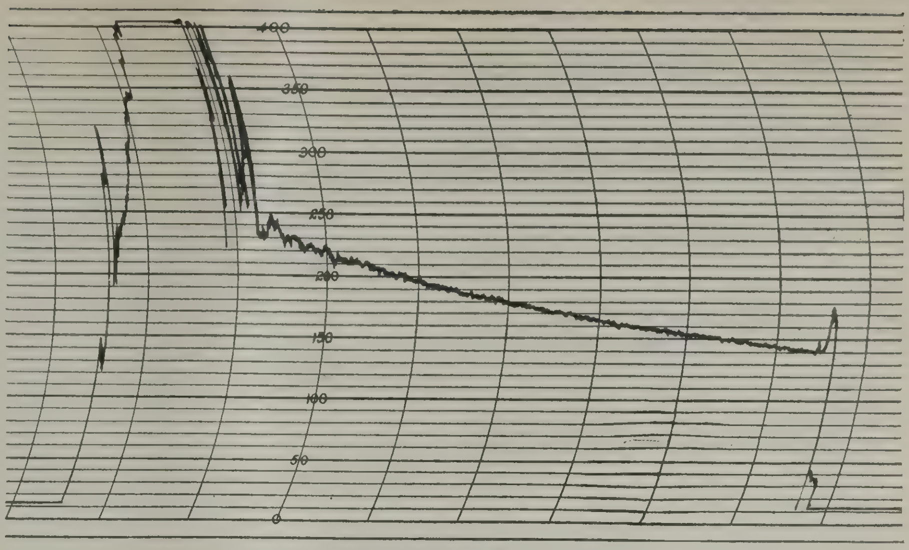
Instead of plunging into the beater, then, and getting involved between the roll bars and the bedplate, the first step is rather to define and measure these physical attributes of paper. The logic and practicality of this seemed perfectly obvious to us when we launched out on the problem twelve or thirteen years ago, though so far as I know there has been no other study of the subject made in this way either before or since.

Tools for Measuring Action of the Beater

The first tool needed is something by which to make a sheet of paper from a sample that may be taken from the beater at any time, embodying the essentials of the paper machine, but free from the variables of the paper machine and independent of human error. To fill this need the standard pulp sheet mould was developed. Round sheets can be made by its aid containing a predetermined weight of pulp, formed with uniform thickness under a uniform suction, removed from the mesh without the pressure of couching, and dried under uniform conditions.

Curves that Show Changes in Pulp During Beater Action

Next come means for testing these sheets. Tests of bursting strength, tensile strength, and shrinkage, were either already developed or quite obvious at that time. We had to develop a test for sizing effect, and for folding endurance. The Schopper folding tester could not be adapted to pulp sheets. Tearing strength is an important property of paper that we did not succeed in devising a test for, and the Elmendorf had not then been offered. By taking suitable samples from the beater, then, and forming them into standard pulp sheets, and making tests such as these on the sheets, we could make curves showing the development of papermaking qualities in the pulp throughout the process of beating. Charts 1 and 2 are early examples of such curves. We referred to them as composite moving pictures of the changes in papermaking characteristics going on in the mass of pulp while the beating action is taking place. Such curves are quite necessary to a study of beating from a papermaking standpoint.



A TYPICAL BEATER DRAG CURVE

Tests for Free and Slow Pulp

Finally, there is the question of freeness, or slowness. This, too, is a physical property, but it does not exist in the paper. It is a property of the stuff determining in important respects the kind of paper that can be formed, and the speed at which it will form. We had to develop a test for slowness. The curve of slowness through a run in a beater is of great interest and importance.

The final result of the effort to obtain a reliable and speedy determination of the slowness of paper stock is described in *Paper Trade Journal* for March 13, 1924, page 51. The apparatus has been improved over the design with which we performed our original researches into the laws governing the beating process, and the articles referred to aims to set forth the improved and standardized design.

Up to this point, then, we had provided ourselves with measurements of the *papermaking characteristics* of pulps. Recognizing the physical nature of paper, we had then at our command methods and means of measuring many of the physical characteristics that would exist in paper if made from a given pulp at a given time. Periodic samples of pulp taken while it was undergoing any kind of change, studied with the aid of these new means of measurement, could be made to show what the changes taking place actually were, from the *papermaking standpoint;* and not only could the nature of such changes be faithfully pictured, but the degree, or rapidity, of the changes could be charted. Armed with this power, we were able to express with accuracy, and with considerable adequacy, the effect of any beater treatment *in its practical bearing on the paper to be made.*

Problem of Roll Bar and Bedplate

The problem of dissecting the action of roll bars and bedplates and the like was the second step, not the first. Before we could evaluate any of the elements of beater action, we had to be able to show *how they would result in the paper to be made.* But in this second step in the work there is also a choice between two general lines of approach, one blind and complex, and the other straight forward and simple. The first of these would be to bring to the beater at once the extremely refined methods of the detached laboratory, by launching out on a study of fibers under the microscope, or on a mathematical treatment of the flybar action, or on a chemical treatment of the initial stuffs and changes that occur, or on more or less of a combination of these. With the power to evaluate such discoveries as these lines of investigation would yield in relation to the *paper to be made,* such involved studies would no doubt be far from hopeless; yet it seems the part of better judgment before getting entangled in complicated prospecting to exhaust first the simpler changes that take place in the stuff, such as have been observed every day in every mill by every beaterman since beaters have been used. What do these things indicate about the character of the *paper to be made?*

Applying the New Means of Measurement

Now, the hardihood of any reader who has stuck with us thus far deserves some reward, and the various steps by which we utilized the homely observations that practical beatermen make about the behavior of stuff will not be detailed again here. They will be found in the Annual Convention Number of PAPER, February 14, 1917, under the title, "Management of the Beater Room." Suffice it to say here that we applied our new means of measurement repeatedly to the stuff under different conditions and with relation to different known facts, diligently for three years, and were fortunate in bringing out of it a law underlying the action of the beater. The law, of course, was not new. Beatermen had been applying that law more or less well for many years, when they felt of the stuff with their hands. But to have the law in specific form was new, and rendered it possible to control with accuracy the action of the beater.

The kind of changes that take place in the stuff, and the extent to which they take place, can be predetermined and governed by measuring the changes also taking place in the surface friction and the internal friction of the stuff in the beater. Obtain measurements of these two frictions. Throw up these measurements in the form of a curve. Every time that this curve is duplicated in form and duration, using the same furnish to the beater, the papermaking characteristics of the stuff will be accurately duplicated.

The Author's Beater Drag

On this law as a basis the Beater Drag was designed. This appliance fits the conditions under which stuff is beaten in the book paper mills of the S. D. Warren Company. It will not fit all conditions, for the law upon which it was designed always applies. The illustrations show it in use. The curve reproduced herewith is a typical curve drawn from the practice at Cumberland Mills, an actual curve made by the automatic recording attachment of the Beater Drag. It is by the duplication of such a curve as this that stuff of uniform papermaking characteristics can be made.

In final result, we had come upon a fundamental law. We had applied that law to the process. As it turned out, our appliance was in effect an accurate, continuous, self-recording, way of *feeling of the stuff*, and that has been the method of judgment used by skilled beatermen one generation after another. As soon as beatermen came to know this, they liked the new way of beating. We had kept our methods and our thoughts simple; we came out with a simple result. That result, I will venture to say, is nevertheless so fundamental to the problem with which we started, that any investigator who may choose to neglect it, will, if he persists to the end, necessarily rediscover it. The comparatively short time required to arrive at this fundamental law, and the fact that the entire cost could be charged against a single by-product of our work and leave a profit of from 100 percent to 300 percent or more, according to the size of the mill, are due solely, in my judgment, to *simplicity in research.*

LESS PAPER MADE IN FEBRUARY

Monthly Statistical Summary Shows 3 Per Cent Decrease Report Says

PRODUCTION of paper by identical mills reporting to the American Paper and Pulp Association and cooperating organizations showed a decrease of 3 percent in February from the January production, according to the monthly statistical summary of the paper and pulp industry.

The tonnage summary is prepared by the American Paper and Pulp Association with the cooperation of the Binders Board Manufacturers Association, News Print Service Bureau, Tissue Paper Manufacturers Association, Wrapping Paper Manufacturers Service Bureau and Writing Paper Manufacturers Association. The figures for February are as follows:

Grade	Number of Mills	Production Net Tons	Shipments Net Tons	Stocks on Hand End of Month Net Tons
Newsprint	68	117,322	115,427	30,288
Book	51	68,298	72,183	33,592
Paperboard	108	110,110	109,556	35,072
Wrapping	89	50,537	51,762	57,761
Bag	26	9,346	9,617	5,829
Fine	83	25,595	25,674	38,644
Tissue	45	10,097	10,255	7,082
Hanging	9	4,451	3,961	2,444
Felts	18	9,763	9,880	1,154
Other Grades	62	17,970	20,266	14,134
Total—All Grades		423,489	428,581	226,000

The statistical table below gives the number of mills reporting to the American Paper and Pulp Association and the U. S. Pulp Producers Association, and the data as to production of the various grades of pulp in February.

Grade	Number of Mills	Production Net Tons	Shipments Net Tons	Stocks on Hand End of Month Net Tons
Groundwood pulp	102	93,415	4,869	88,617
Sulphite, News Grade..	38	40,901	3,276	18,107
Sulphite, Bleached	19	18,866	2,320	3,581
Sulphite, Easy Bleaching	6	5,866	732	1,511
Sulphite, Mitscherlich ..	6	5,287	301	1,115
Sulphate Pulp	12	12,978	2,427	6,642
Soda Pulp	11	13,928	4,156	2,595
Other than Woodpulp..	2	127	80	23
Total—All Grades		191,368	18,161	122,191

Fourth Annual Meeting

The Fourth Annual Meeting of the Woodlands Section of the American Paper and Pulp Association, will be held at the Waldorf-Astoria Hotel in New York on April 9th.

The program of this meeting is as follows:

MORNING SESSION

Chairman's Welcome to Members and Guests
C. W. Hurtubis, Hammermill Paper Co.
Secretary-Treasurer's Report
O. M. Porter, American Paper and Pulp Association.
The Northeastern Forest Experiment Station
S. T. Dana, Director.
Forest Organization for Fire Control
Major E. W. Kelley, U. S. Forest Service.
Pulpwood Supplies—Can a Paper Company Afford to Spend Money on its Timberlands to Insure Increased Production?
H. B. Shepard, Consulting Forester.

AFTERNOON SESSION

Joint Meeting with the Technical Association
Elimination of Waste and the Reduction of Logging Operation Costs
E. S. Bryant, Consulting Forester.
Pulpwood Decay
John Rue, U. S. Forest Products Laboratory.
John E. Alexander, Nekoosa-Edwards Paper Co.
Commercial Reforestation
Prof. S. N. Spring, Cornell University.
A film, "Bare Acres," New York State Conservation Commission.

* * *

Simplified Practice Recommendation

In accordance with the action of a general conference of representatives of manufacturers, distributors and users of paper, which met at the Bureau of Standards in Washington on June 19, 1923, the Department of Commerce recommends that the sizes of paper and their doubles, listed below, shall be recognized standards; and further, that all paper substance weights shall be stated in terms of the basic 25" x 40" size. This recommendation is to become effective July 1, 1924, and is to be subject to regular annual review by the industry with such yearly revision as may be shown to be desirable by experience and the investigation of the standing committee of the industry.

STOCK SIZES

General Printing and Publishing

26 x 29 inches—29 x 52 inches
25 x 38 " —38 x 50 "
32 x 44 " —44 x 64 "
35 x 45½ "
37 x 49 "

STOCK SIZES

Forms and Letterheads
(bonds, ledgers & writing papers)

17 x 22 inches—22 x 34 inches
17 x 28 " —28 x 34 "
19 x 24 " —24 x 38 "

Book Publishers

30½ x 41 inches—41 x 61 inches

Rapid Analysis of Paper

Factors That Influence Character of Paper in the Beating Process—Art of the Beaterman Gained by Long Experience and His Work Can Not ge Taylorized—How to Determine the Degree of Sizing in Paper—Tests for Rosin in Paper Fibers

This is the third installment of a series of articles translated from *Le Moniteur de la Papeterie Francaise* which aims to give paper manufacturers easily applied methods for determining the constituents of a paper sample for purposes of duplication. From a study of the articles, manufacturers will know what to expect from their mill chemists when they are called upon to analyze a paper sample so that the information may be supplied to the superintendent in order that he may be in a position to duplicate the paper in the mill. In the present installment, the technic of beating is considered, credit being given to the beaterman for a special knowledge of beating conditions and the perfection of the process, which can only come from long experience. It also takes up a study of sizing with regard to tests for efficiency and the qualitative determination of rosin in paper.

AT the start of this series of articles on the complete analysis of paper (see PAPER for Dec. 6, 1923), it was stated that in order to afford complete and useful information regarding the paper an analysis must be relative or comparative in character. In this determination, that is, of the degree of beating to which the pulp has been subjected, it will be demonstrated that this manner of procedure in paper analysis is an essential thing. The paper chemist has no other course to follow.

Beating Is an Art

There is an axiom current in the paper field which every mill superintendent is understood to follow. This reads, "Paper is made in the beater." Pulps of entirely different qualities and properties can be obtained from exactly the same raw materials which are worked up in the beater under different conditions. The expert beaterman is a worker who is much sought after, for his experience is wide and considerable. It is an error, however, to suppose that it is possible to Taylorize the functions of the beaterman, so as to deprive him of all initiative, as is sometimes attempted in paper mills.

The author is aware of the advantages of using certain characteristic and interesting figures to control the operation, but, as he says, the factors that are involved in the beating process are so complex and so numerous that this is not practical. Thus, in addition to the composition of the pulp, the heat allowed to be developed in the beating operation, degree of dilution of the pulp and similar conditions, it is also necessary to take into consideration the number and the structure of the beater roll bars as well as of the bedplate bars. Hence the matter is greatly complicated and it is highly impracticable if not altogether impossible to define the exact conditions for the production of one grade of pulp or another in figures. The whole matter rests with the operator who is in charge of the beater who by feeling and testing the pulp between his fingers as well as from its general appearance can tell whether or not it has reached the desired condition and can be discharged from the beater. The technic of the beaterman is empirical and a matter of experience.

To reduce the beaterman's art to mathematical figures would be like the layman trying to make a sauce by mixing the various ingredients together without possessing the requisite knowledge of a master chef. The sauce, just like the paper, would be of little value. The paper would break, the paper web would be too loose or too tight, and for all that it would have been made in accordance with exact theoretical conditions.

What the Papermaker Must Know

Hence as far as the papermaker is concerned, it is not of importance for him to know that Paper A is composed of fibers whose average length is a few tenths of a millimeter. This information does not afford the papermaker, who may know nothing about the average length of fibers in his papers and care less about it, any information on which he can compare the paper sample that he is asked to reproduce with the product he makes. On the other hand what is useful knowledge to him is to tell him, for example, that Paper A, which it is desired to reproduce, is the same for all practical purposes as Paper B; that the fibers are a little more cut up in the beating operation and that the pulp from which A is made is a little slower, which indicates that the beating has been prolonged for a somewhat longer period of time. The papermaker then knows just what beater can be employed to mke pulp which will give a paper like A and he advises the beaterman on the few simple modifications that he must carry out in the progress of the beating operation to obtain a pulp like the one from which paper sample A was made.

The study of the effect of beating on the quality of the paper is something that does not fall within the scope of analytical work. It is a more practical matter. Hence the author will simply limit himself to a short description of the influence of the degree of beating on the strength, the feel and the thickness of the paper.

The Effects of Degree of Beating

The different kinds of beating may be classified in the following manner.

1. Long fiber pulp, free
 fibers very slightly injured.
2. Short fiber pulp, free
 fibers cut, slightly injured.
3. Long fiber pulp, slow
 fibers slightly cut and well beaten.
4. Short fiber pulp, slow
 fibers very much cut up and hydrated.

From the didactic point of view this classification is complete, but it is not so from the practical standpoint. There are many grades of pulp which lie in between the four classes named above and many terms peculiar to the paper industry are required to distinguish between the different grades.

The papermaker is primarily concerned with the length of time that he will have to spend on beating process in order to be able to make a paper of desired qualities from the pulp that he obtained from the beaters. It is the opinion of the author that a photomicrograph may before and after the beating process is concluded enable the papermaker to see whether or not the process has been carried out under proper conditions. It affords him a check on the efficiency of the beaterroom and of the skill and attention which his beatermen are giving this important step in the papermaking process.

Determination of the Sizing in Paper

The author recalls to readers the statement made at the outset of this series of articles. At that time he stated that the series would not form an encyclopedic study of all methods of analysis and every detail of manipulation. This he would leave to the compilers of special works on the subject.

The author has approached the subject from a different point of view. He has worked along the lines of criticizing the various analytical methods that are in common use, so as to give the reader an idea of their value based on the experience which the author has had with them In working toward this end the author has been able to eliminate from use in his laboratories methods that are not considered sufficiently accurate or reliable for practical purposes.

The Degree of Sizing Quality

There have been many methods proposed for determining the degree of sizing or of the sizing quality of paper. Unfortunately these methods are governed by so many different conditions and factors that it is impossible to view them in any light but that of limited applicability and reliability. The interpretation of results to a great extent depends on the experimenter and analyst as well as on the materials used. From such a condition of affairs the expected result is a series of continuous and numerous contests beteween the manufacturers and purchasers of the sized paper as to whether a proper quality of paper was being sold to them.

One such method is mentioned here just for the mere purpose of bringing it to the attention of the reader. That method consists in drawing ink lines with a pen or some other suitable means on the paper and then observing the way in which the ink penetrates into the paper. The conclusions which are commonly drawn from this method are generally quite vague, and under any and all conditions they afford the manufacturer aboslutely no information at all regarding the proportion of sizing material that is incorporated with the paper.

The same is true of the method devised by Schluttig and Neumann. As is known this method consists of causing a chemical reaction between a solution of ferric chloride and a solution of tannin to take place through the paper. This method is of some value in controlling the sizing quality of a paper or different papers manufactured in one and the same mill. It makes it possible for the papermaker to tell whether or not the paper that he is making is being sized homogeneously.

Nature of the Ink Used in This Test Is Important

But all these tests are controlled to a greater or less extent by the character of the ink employed. They are also affected by the degree of gloss possessed by the paper surface and last but not least they depend on the personal equation of the experimenter and analyst. Nevertheless in order to make a rapid test of the sizing quality of a paper, to verify whether it has been sufficiently sized, the author prefers the pen and ink test.

It appears to us to be more interesting and more advisable for the papermaker to take as a basis the following definition:

The degree of sizing in a paper is a function of the nature and the quantity of the sizing materials that are contained in the paper, on the assumption that the conditions of good manufacturing practice have been faithfully carried out.

Determination of the Rosin Content of Paper

The first matter that demands attention under this general heading is the making of qualitative tests to determine the presence of rosin in the paper.

The first test employs ether and is carried out in the following manner: A drop of sulphuric ether is allowed to fall on a paper sample by means of a small pipette. The drop of ether is allowed to evaporate from the surface of the paper and another drop is permitted to fall on the same spot from which the first drop evaporated. If the paper has been sized with rosin a ring is formed around the spot which has been softened by the liquid.

If the quantity of rosin that has been precipitated on the paper fibers is very small, this test will not be sufficiently characteristic and one of the two following methods should be used in place of the ether test.

Phenol-Bromine Method

Two solutions are employed in this method.

The first solution is made by dissolving half a grain of phenol in two cubic centimeters of carbon tetrachloride. The second solution is made by dissolving one cubic centimeter of bromine in four centimeters of carbon tetrachloride.

A drop of the first solution is placed on the paper sample that is being tested. This is best done with the aid of an ordinary glass stirring rod. Then the paper with the drop of phenol solution on it is immediately exposed to the second solution which may be contained in an ordinary evaporating dish or crucible. If rosin is present in the paper sample a dull blue coloration will be developed at the point where the paper has been impregnated with the phenol. The color formed is quite fugitive and will disappear in a few minutes.

The Acetic Anhydride Method

The third method that may be employed to determine whether or not the paper has been sized with rosin is described below.

A sample of the paper that is being analyzed is torn into small pieces and introduced into a conical flask in which there has been placed a few cubic centimeters of carbon tetrachloride. The flask is placed on a hot air bath and brought to the boiling point. Then about two to three cubic centimeters of the liquor is decanted into a test-tube. Then half a cubic centimeter of acetic anhydride is added. Then concentrated sulphuric acid is allowed to run down the walls of the test-tube drop by drop until it comes in contact with the solution. When rosin has been used in sizing the paper, a beautiful reddish violet coloration will be produced on contact between the sulphuric acid and the liquid in the test-tube.

If the proportion of rosin employed in sizing the paper has been small, a rose colored ring will be formed at the surface of contact of the concentrated sulphuric acid and the liquid in the test-tube. In both cases the coloration that is produced, in the former case all throughout the solution, and in the latter case just as a ring at the surface of contact, soon disappears and in its place a greenish yellow shade develops.

The author has found this qualitative test for the presence of rosin as a sizing material in paper always to give him good results and it is particularly recommended to the reader.

Program of Woodlands Section

In announcing the Woodlands Section meeting, Secretary Baker points out that these meetings have always been well attended, because the programs have been both interesting and instructive. This year's program is to be no exception, as will be noted by the program. The following papers will be discussed:

1—Forest Organization for Fire Control, by Major E. W. Kelley, U. S. Forest Service.
Major Kelley will discuss practical methods of keeping out and putting out forest fires.

2—Forest Management for Pulpwood Production, by H. B. Shepard, consulting forester.
This is quite a different story from reforestation. *You* get the profit of your investment in fifteen or twenty years, not someone else in eighty or a hundred years. This is worth looking into.

3—Pulpwood Decay, by J. D. Rue, U. S. Forest Products Laboratory.
The facts as developed by a careful, scientific investigation, with the means of applying them in the woods to increase the output of pulp per acre and cut down operating expenses.

The morning session of the Woodlands Section meeting will be held in Room 115, Waldorf-Astoria, Wednesday, April 9. The afternoon session will be a joint meeting with the Technical Association in the Myrtle Room, Waldorf-Astoria.

Bleach Liquors From Liquid Chlorine

Importance of the Unit Principle in Their Preparation Pointed Out by Recognized Authority

By J. H. MacMAHON
*Technical Representative,
The Mathieson Alkali Works, Inc.*

THE rapid progress which liquid chlorine has made in the pulp and paper industry since it was first introduced into this important field some three or four years ago is attributable to the marked economy and the many advantages it has shown over bleaching powder.

During 1923 there has been a notable increase in the production of liquid chlorine in this country until it has now reached a figure approximating 34,000 tons a year, the equivalent of 100,000 tons of bleaching powder, of which quantity nearly 85 per cent. is consumed in the pulp and paper industry. The increased interest manifested in its use by all engaged in bleaching operations, would indicate that it will be but a short time before liquid chlorine will supplant bleaching powder, not alone in the paper industry, but in other industries where this old-time commodity has long been used.

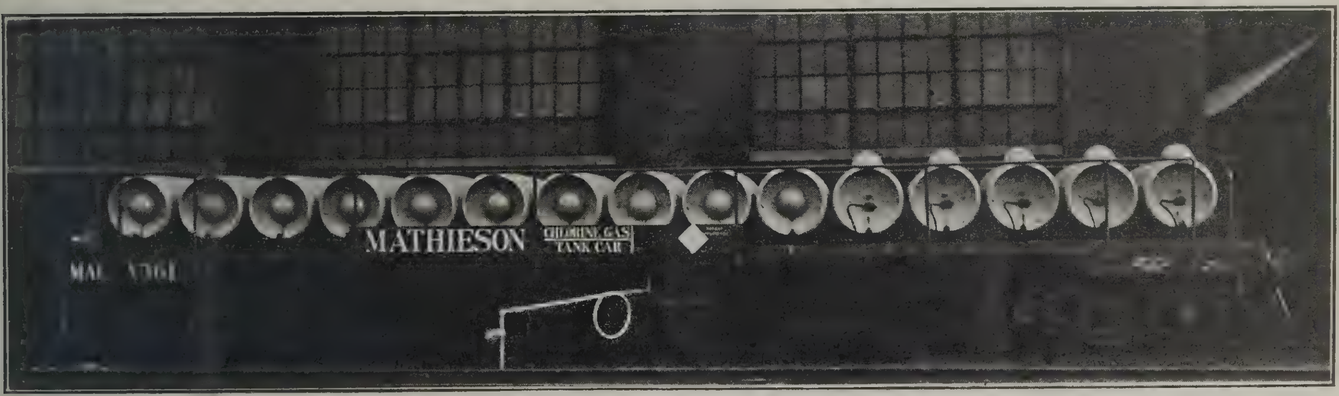

Figure 1

In keeping with this great increase in the consumption of liquid chlorine, progressive manufacturers of the commodity have made every effort to develop new and improved methods for the preparation of bleach liquors. Foremost among these is the Mathieson System, conceived and developed by the technical staff of the Mathieson Alkali Works, at the present time the largest producers of liquid chlorine in the world. Two important principles form the basis of the Mathieson System: (1) the use of predetermined quantities of all materials, weighed with absolute accuracy, and (2) the utilization of the latent heat of vaporization of the liquid chlorine to counteract the heat of reaction of the chlorine with the lime.

Preparing Bleach Liquor

In the preparation of bleach liquors from liquid chlorine it is essential that certain conditions be strictly observed if efficient and economical results are to be obtained. The avoidance of over-chlorination, or passing chlorine into the solution in excess of the amount required to combine with the lime, is an important consideration which is covered by the first of the foregoing principles. Over-chlorination produces an acid condition in the solution; its stability is affected and a rapid decomposition of the hypochlorite takes place. By passing a unit weight of chlorine into a unit volume of milk of lime, bleach liquors of uniform strength and of any desired concentration can be obtained and the possibility of over-chlorination is entirely eliminated.

The other important condition to be observed is careful control of the temperature of the liquor. The reaction of the chlorine with the base produces heat which raises the temperature of the solution in direct proportion to the amount of chlorine absorbed. Should a temperature of approximately 100° Fahrenheit be reached, decomposition of the hypochlorite begins, forming chlorates and resulting in an increasing loss in bleaching strength as the temperature rises above this point. The second principle of the Mathieson System mentioned above gives absolute control over this factor by keeping the temperature of the liquor within safe limits at all times. The liquid chlorine passes from the liquid to the gaseous state while passing through the lead coil (Fig. 3) which is immersed in the solution, so that the refrigerative effect of the vaporizing chlorine counteracts the heat of reaction in the liquor. The lead coil serves a twofold purpose, functioning as a vaporizer for the liquid chlorine and as a cooling medium for controlling the temperature of the liquor during its preparation.

Multi-Unit Tank Car

Let us take up the first of the above named principles and consider the means of fulfilling the required conditions. Obviously the liquid chlorine is the only reagent which offers difficulty in weighing with absolute accuracy, particularly when delivered to the consumer's plant in a single-unit tank car. This difficulty is completely overcome by the Mathieson Multi-Unit Tank Car, which carries fifteen one-ton containers of liquid chlorine. Each container has a net weight of exactly 2000 lb. and provides an accurately weighed unit for preparing uniform bleach liquors. Figure 1 shows the Multi-Unit Tank Car on a siding with five of the one-ton containers connected to a header with which the car is equipped.

It is only necessary to connect up at one time enough containers for the day's requirements. The contents of each container is exhausted independently, it being necessary only to remove the bonnet and make connection between the valve and header by means of a connector and flexible copper tube, as shown in Fig. 4.

In the case of a commodity of the nature of liquid chlorine it is of the utmost importance that every precaution be taken in the interest of public safety to minimize the hazard attending its transportation and handling at consumers' plants. It was with this end in view as well as to provide for greater economy and convenience in using liquid chlorine that Mathieson engineers developed the Multi-Unit Tank Car. The design of the car follows the standard steel underframe construction except that it is equipped with special cradles and clamps which secure the one-ton containers rigidly to the car frame without danger of shifting or accidental removal from the car.

When this car was placed in service by the Mathieson Alkali Works over two years ago, the transportation companies refused to allow it the same rates and privileges as other tank cars. Convinced that the continued service of the Multi-Unit Car was in the best interests of both the public and the chlorine-consuming industries, the Mathieson Company appealed to the Interstate Commerce Commission for removal of this discrimination and continued making shipments at greatly increased expense. During the past two years over two hundred thousand dollars was paid out in excess freight charges on shipments made in this car. A recent decision of the Interstate Commerce Commission approved the Multi-Unit Tank Car, giving it the same rates and privileges as other tank cars, and awarded full reparations with interest to the Mathieson Company.

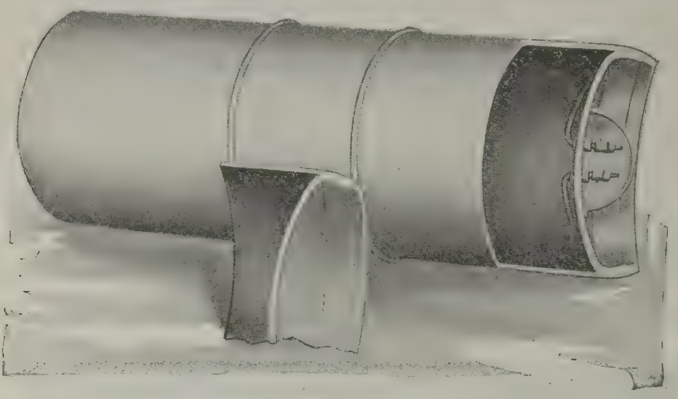

Figure 2

Having followed the case through to its logical conclusion, the Mathieson Alkali Works is now making arrangements whereby all consumers of liquid chlorine can secure the Multi-Unit Car from any manufacturer. It may be said without fear of contradiction that the development and official approval of the Multi-Unit Tank Car mark an epoch in the history of liquid chlorine.

One-Ton Containers

As the ton-container is the important unit for preparing bleach liquors in the paper industry, a few facts regarding it may be of interest. These containers are of forged steel with a wall thickness of three-eighths of an inch. The head of the drum is lap-welded to the body proper and has a thickness of three-fourths of an inch. An easily removable bonnet fits over the valves and protects them from injury. Each drum is equipped with six safety plugs, three screwed into each head, filled with fusible metal of fusing-point approximately 150° Fahrenheit. The purpose of these plugs is to relieve the contents in case of fire before a pressure is reached sufficient to rupture the drum. The containers are tested for an internal pressure of 500 pounds per square inch and comply with all regulations of the Bureau of Explosives and the Interstate Commerce Commission. The drum alone weighs approximately 1300 pounds and contains exactly 2000 pounds of liquid chlorine.

The construction of the Multi-Unit Tank Car permits the easy removal of the ton containers at the producer's plant for cleaning, inspection and absolutely accurate refilling. The Mathieson Company also ships liquid chlorine in single-unit tank cars and in steel cylinders containing even weights of 105 and 150 pounds. In some paper mills where the consumption of bleach liquor is small, one or more 150-pound cylinders may be used as the predetermined unit of liquid chlorine. When units are desired intermediate between the large cylinder and the ton container, it has been found satisfactory to place the latter on a floor scale and withdraw the required portion of the contents. The scale may be so equipped that an electrical circuit is closed when the weight arm rises, thus ringing a signal and notifying the operator that the predetermined weight has been withdrawn and the valve should be closed.

Converting Existing Equipment

By the proper control of several factors, the Mathieson System with the two basic principles previously mentioned may easily be adapted to any existing equipment using bleaching powder. Where individual tanks have not the required capacity to operate on the unit basis with one ton of liquid chlorine, two or more tanks can be connected together and the piping so arranged that the system operates as a unit. In such cases the lead coil shown in Fig. 3 is necessary in only one tank, though the liquor is circulated through all the tanks in the system. Usually this lead expansion coil is about the only additional equipment required and the change over to liquid chlorine can be made at comparatively little expense.

It may happen that only one tank is available and that it has not sufficient capacity to absorb one ton of chlorine unless the concentration of the bleach liquor produced is made greater than in ordinary practice. Provided the conditions are carefully controlled so that the temperature of the liquor at the close of the operation does not exceed 100° Fahrenheit, it is practical to prepare bleach solutions of as high a concentration as 80 grams per liter of available chlorine. Liquors of high concentration should be diluted, as soon as possible after being prepared, to the strength at which they will be used at the mill in order to insure stability and promote rapid settling.

In other words, the temperature of the bleach liquor at the end of the chlorination is the factor which determines at what concentration the system can be operated without danger of the formation of chlorates and decomposition of the hypochlorite. The maximum temperature of the finished liquor should not exceed 100° Fahrenheit. It is obvious, therefore, that the colder the water at the beginning of the operation, the greater the concentration that can be reached before the danger point of temperature is exceeded, since there is a definite rise of temperature in the liquor for each unit weight of chlorine absorbed.

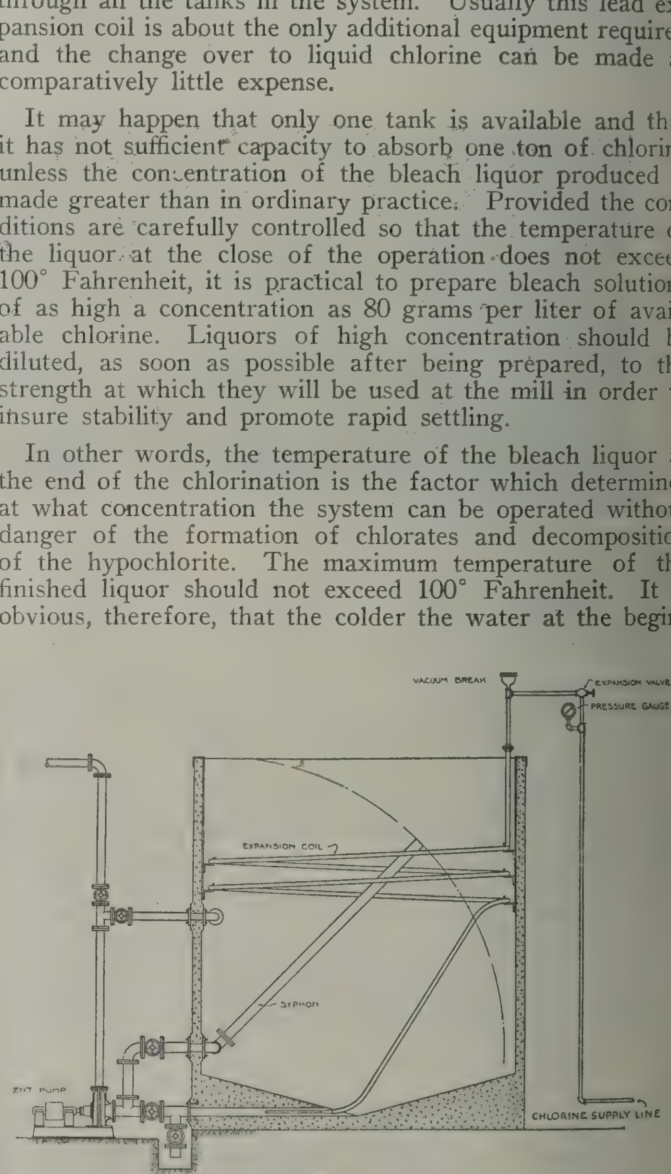

Figure 3

The following table is intended to show the possibilities under various conditions of operation, given a definite available tank capacity. In each case the liquid chlorine unit is one ton.

Tank Capacity for 1 ton Chlorine	Maximum Concentration	Initial Temperature
2400 gal.	80 g.p.l. cl.	50° F.
3200 gal.	75 g.p.l. cl.	55° F.
3600 gal.	67 g.p.l. cl.	60° F.
4200 gal.	58 g.p.l. cl.	65° F.
4800 gal.	50 g.p.l. cl.	70° F.
5700 gal.	42 g.p.l. cl.	75° F.
7000 gal.	34 g.p.l. cl.	80° F.
9600 gal.	25 g.p.l. cl.	85° F.

For example, with an available tank capacity of 4200 gallons and a chlorine unit of one ton, the strength of the resulting liquor will be 58 grams per liter of chlorine and the temperature at the beginning of the operation should be not more than 65° Fahrenheit.

The strength of bleach liquor most commonly used in paper mills and one which we recommend has a concentration of 30 grams per liter of chlorine, or about 6° Be. One ton of chlorine in 8000 gallons of liquor will produce this concentration. The maximum strength of liquor to be used for bleaching paper pulp can be considered as from 30 to 40 grams per liter of chlorine, or about 6° to 7° Be., while the minimum strength should be 20 grams per liter, or about 4° Be. One ton of chlorine in 12,000 gallons of solution will produce the latter concentration.

Details of Chlorinating Tank

The sectional view in Fig. 3 shows chlorinating tank of concrete construction. It is equipped with an expansion coil of 1½ inch extra heavy lead pipe about thirty feet long which is connected at one end to the liquid chlorine line. The other end terminates in the suction of the pump.

The centrifugal pump is of standard design and has a capacity of about 500 gallons per minute. The connections on the suction side are of five-inch pipe. The latter pipe enters the tank about four feet from the top and is placed at a tangent to it with valves and fittings as shown. The liquid chlorine pipe is one-inch extra heavy iron pipe connected at one end to the ton container by a flexible copper tube. The other end which is connected to the expansion coil is fitted with a pressure gauge and expansion valve. The five-inch drop syphon draws off the bleach liquor when settled.

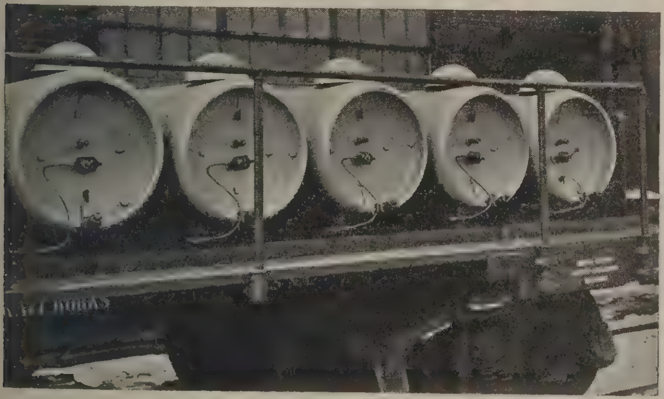

Figure 4

The tank has a total capacity of 10,000 gallons with an available capacity under operating conditions of 8,000 gallons, allowing sufficient margin for the settled lime sludge.

It is designed to hold a sufficient quantity of milk of lime to absorb 2,000 lb. of chlorine, the unit weight, and this weight of chlorine in a volume of 8,000 gallons will produce bleach liquor of a concentration of 30 grams per liter available chlorine or about 6¼° Baume.

A high calcium lime is used to absorb the chlorine and either quicklime or hydrated lime may be employed. When quicklime is used about one pound of lime per one pound of chlorine will be required; with hydrated lime about one and a quarter pounds depending on the quality of the lime. While quicklime is less expensive, hydrated lime is generally preferred, as the necessity of slacking and cooling the quicklime is dispensed with.

Operating the System

In carrying out the operation, approximately 8,000 gallons of water is run into the chlorinating tank, the circulating pump is started and about 2,300 lb. of hydrated lime added. A container holding 2,000 lb. of liquid chlorine is connected to the pipe leading to the expansion coil.

It will be seen from the photograph of ton container (Fig. 2) that it is provided with two eduction pipes which project radially from the centre of the head in opposite directions so that gaseous or liquid chlorine may be withdrawn. With the valves in a vertical line and the connection made to the lower valve liquid chlorine is withdrawn and the container can be completely emptied.

When the milk of lime is in good circulation the valve on the container is opened. The liquid chlorine flows under its own pressure through the eduction pipe to the expansion coil, the rate being regulated by the expansion valve. The liquid chlorine is vaporized in the coil and advantage is thus taken of the latent heat of vaporization of liquid chlorine to cool the liquor and prevent the temperature from rising to a point where chlorine compounds which are not available for bleaching are formed.

The chlorine gas on leaving the coil enters the suction line of the pump where it is absorbed by the milk of lime. The circulation of the liquor by the pump is continued until all of the chlorine is absorbed, which is indicated by the pressure gauge on the liquid chlorine pipe line. When the pointer on this gauge registers zero all chlorine will have been discharged from the container, which is then disconnected, the circulating pump stopped and the batch allowed to settle. When settled the clear liquor is drawn off the sludge by the drop syphon and pumped to storage tanks. The hydrometer strength of the liquor will be approximately 6° Baume and by maintaining the same volume of liquor with the same weight of chlorine for each batch bleach liquor of uniform strength is insured.

There will be a gradual accumulation of sludge in the chlorinating tank due chiefly to impurities in the lime. It will be found that several batches can be run before it becomes necessary to wash the sludge. The wash liquor is pumped to a separate tank to be used as make up liquor for succeeding batches and the sludge allowed to run to waste.

The loss from this source should not exceed 1 percent of chlorine.

A batch of bleach liquor containing 2000 lb. of chlorine can be prepared, settled and pumped to storage tanks in less than six hours. Assuming the sludge is washed after each four batches run, the tank will have a capacity for at least three tons liquid chlorine, or the equivalent of about 10 tons of bleaching powder, per 24 hour day.

Mills Using the System

The following paper mills have installed the Mathieson System and are now operating it:

Hammermill Paper Company, Erie, Pa.

Riordon Pulp Corporation, Hawkesbury, Ont., Canada

Hammersley Mfg. Company, Garfield, N. J.

Consolidated Water Power & Paper Company, Appleton, Wisconsin.

Mead Fibre Company, Kingsport, Tenn.

Champion Fibre Company, Canton, N. C.

Provincial Paper Mills, Port Arthur, Ont.

Port Huron Sulphite & Paper Company, Port Huron, Michigan.

Crystal Tissue Company, Middletown, Ohio.
S. George Paper Company, Wellsburg, W. Va.
Sweet Bros. Mfg. Company, Inc., Phoenix, N. Y.
Dill & Collins Company, Philadelphia, Pa.
District of Columbia Paper Mfg. Co., Washington, D. C.
Nekoosa-Edwards Paper Company, Port Edwards, Wis.
E. B. Eddy Company, Hull, Quebec, Canada.

Paper mills where the Mathieson System has been installed but is not yet ready for operating, are:

Kalamazoo Vegetable Parchment Paper Co., Kalamazoo, Mich.
Paterson Parchment Paper Co., Passaic, N. J.
International Paper Co., Piercefield, N. Y.

There are also a number of mills which are contemplating installing this System and for which plans are being prepared.

Summary

It will be seen that the Mathieson System embodies novel features which offer many advantages in the preparation of bleach liquor from liquid chlorine. The method employed for vaporizing the liquid chlorine by passing it through a coil immersed in the bleach liquor insures a rapid and steady flow of gas and dispenses with the use of evaporating devices which require to be steam heated and the cooling effect on the bleach liquor by the vaporization of the liquid chlorine will be found to be of special advantage, particularly during the summer months when difficulty is experienced in keeping the temperature of the liquor down to avoid losses of available chlorine through overheating.

By the introduction of the unit principle the operation is carried out with practically automatic control and skilled labor is not required. The lime can be so finely adjusted that the alkalinity of the liquor is greatly reduced with a corresponding increase in its bleaching velocity. Bleach liquors of this characteristic combined with a uniform concentration of the chlorine content enables the bleaching of the stock to be carried out with greater efficiency and economy.

The Multi-Unit Car with its individually-weighed containers of exactly two thousand pounds net provides an accurate unit measure for preparing uniform bleach liquor. In checking and stocktaking there is never any uncertainty as to the quantity of liquid chlorine received or on hand.

The services of the Mathieson technical staff, who have had long experience in bleach operations, are always available to give advice and direction when required. All installations are started under their personal supervision to see that the most efficient results are obtained from the Mathieson System.

Puts Out New Vibration Screen

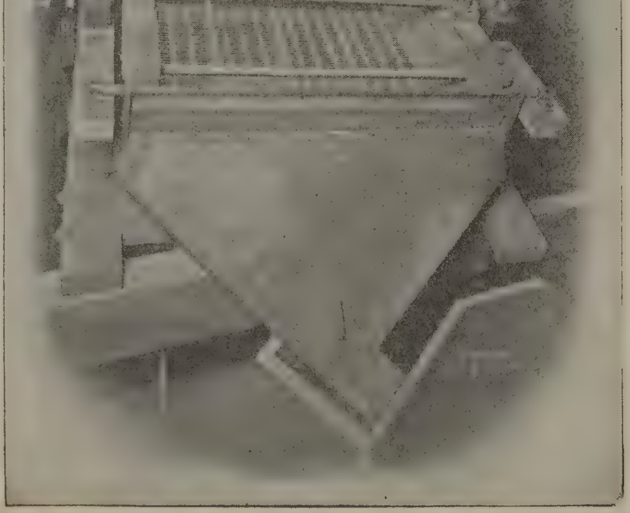
There has recently been put on the market by the Link-Belt Company of Philadelphia a screen for fine separation that is absolutely novel in principle.

The necessity for effective and thorough screening of many fine materials has long been recognized and this screen, which is known as the Link-Belt Vibrating Screen has been developed to meet these rigid requirements.

Heretofore agitation of the screen surface has been obtained by a rapid series of rigidly imparted blows, in some cases through mechanical, but preferably electrical devices. It is obvious that this results in lack of uniformity over the screening surface, the vibrations being more intense on those portions of the screen nearest the points of impact of the agitators.

Vibrations of the Link-Belt Screen are produced by the action of an unbalanced pulley supported on the screening frame and rotated at high speed. Every portion of the screen surface is vibrated uniformly, with the result that the entire surface is utilized for its most effective work.

The Link-Belt Vibrating Screen is the invention of Prof. G. A. Overstrom, a brilliant and widely-known mining engineer. Prof. Overstrom was for many years Dean of the Utah College of Mining, and there was brought into intimate contact with the problems of fine ore concentration.



This device is finding an extensive use in the screening of by-products, coke, gypsum, cement, fertilizers, coals, pigments, chemical products,—in a wide range of industries in fact. It effects thorough screening through the finest mesh of any product that can be screened.

Not infrequently it has happened that some of the cleverest inventions and most effective devices have been marked by extreme simplicity, and this is strikingly true of the Link-Belt Vibrating Screen. This, no less that its singularly effective action, at once impress the observer.

OFFERS MORTGAGE BONDS ON SALE IN WEST

THE Lumbermen's Trust Company and the Freeman, Smith & Camp Company are offering for sale a $350,000 issue of first closed mortgage 6½ per cent bonds of the California-Oregon Paper Mills.

The bonds mature from January 1925, to 1935, and are being offered to yield 6½ to 6¾ per cent dependable on time of maturity. The issue is callable at 101.

This new bond issue represents the total funded debt of the company, whose capitalization includes in addition $209,500 of cumulative 8 per cent preferred stock and $821,200 of common stock.

Besides being secured by mortgage on the equipment of the company the trust indenture provides for the deposit of $450,000 par value stock of the Columbia River Paper Mills owned by the company; also that current assets be kept equal to 150 per cent of the funded debt, including this deposit stock. The company promises whenever a dividend is paid on common stock an equal amount be used to retire bonds of the present issue, which is made to retire current indebtedness and defray the cost of installing additional paper machinery and for making other additions and changes in the plants of the company.

The California-Oregon Paper Mills Company operates a mill of 40,000 pounds daily capacity at Los Angles and owns a 54-acre site adjoining the Crown-Williamette Paper Company plant at Camas, Washington, together with 50,000,000 feet of timber and logging equipment. It also owns 37 per cent of the capital stock in the Columbus River Paper Mills of Vancouver.

Plants and properties of the company are carried at a book value of $1,039,991.97, replacement value of its Los Angeles plant alone, however, being appraised at $978,253.40 and depreciating value at $760,967.71, giving net assets of 327 per cent of the funded debt Earnings of the company applicable to interest charges since 1920 have averaged $94,250 annually. Net sales for the same period have aggregated $575,000.

Mr. F. W. Leadbetter, who is president of the company, is one of the pioneer paper men of the Pacific coast. He is also president of the Oregon Pulp & Paper Company of Salem, Oregon; a director and one of the principal owners in the Crown-Williamette Paper Company; organizer, official and heavy stockholder in the Columbia River Paper Mills at Vancouver, Washington; and owns a half interest in the Spaulding Logging Co.

Through the Paper Mills of Europe

R. S. Johnston Visits Many Pulp and Paper Mills in Northern Europe and Finds Great Interest Taken in American High Speed Production Methods—Notes on the Character of Machinery Used and Grades of Paper Made in Finland, Norway, Sweden, Denmark, Belgium and France

WHAT is said to be the first trip to be taken by a representative of American paper manufacurers through Northern Europe since he war is described in interesting fashon in Pusey & Jones' *Super-Calender* y R. S. Johnston, general sales agent f The Pusey & Jones Company. Mr. ohnston visited mills in Norway, weden, Finland, Denmark, Belgium, rance and England found an increasg interest among European manufacurers in high-speed production methods paper manufacture. In Finland, Mr. ohnston took an order from Kymmene ktiebolag of Kuusankoski, for a 154-ch, new modern, high speed paper achine of the latest Pusey-Jones deign and construction. The Kymmene ompany is the largest independent paer manufacturing concern in Finland, stablished many years.

It stands to Mr. Johnston's credit hat in taking the contract for this mahine he could answer the many quesons of the firm's corps of engineers nd experts. He could give definite inormation by sitting down at a drawg table with his coat off, and making lans to scale to fit their mill condions. He did a good deal to cement he friendship and good feeling which egan in 1896, when the Pusey-Jones ompany built for the Kymmene Aktieolag, a paper machine having a width of 112 inches, suitable for a wire 110 inches wide. The writing right on the spot of a long technical specification covering thirty-one typewritten pages, is another part of his successful negotiations.

R. S. JOHNSTON
General Sales Agent, P. & J. Co.

R. S. JOHNSTON
on the Esplanadgatan, Helsingfors

Meets Petter Larsen

In speaking of his trip to Europe, Mr. Johnston tells of meeting in Stockholm his old friend Petter Larsen, sales engineer of Lorentzen & Wettre, who visited the United States in 1920. We shall now let him tell the story of his experiences in his own way. First, he notes that Petter has traveled through Scandinavia, Finland and Russia for upwards of thirty years, and knows intimately the officials of every pulp and paper mill worthy of the name. In his numerous trips to America he has also made many acquaintances, and his cheery smile and hearty handshake is an "open sesame" everywhere.

Greetings had hardly been disposed of when Petter said: "We must hurry to Kymmene, they will install a new paper machine, and we must smack while the iron is warm." However, a few days grace was granted, thus giving opportunity to take in the sights of Helsingfors, and become more or less acquainted with the people and customs of this most northern world capital.

The Sights of Helsingfors

Esplanadgatan (the principal street) during noon hour was crowded with people as well dressed and good looking as those at home, with noticeably rosy cheeks and all of a hardy and athletic appearance. The street traffic is made up of all sorts of vehicles, with the Russian type "drosky" predominant and a few automobiles. The streets are immaculately clean. The city has many fine stores, banks and other establishments, the buildings being usually of granite, four or five stories high, of beautiful architecture and striking appearance. Many American goods are on display in the shops. A particularly handsome railroad station was conveniently located opposite the fine new hotel "Societeteshuset."

Both Swedish and Finnish are spoken in the street, and all signs, timetables and even the movies are in both languages, although Swedish is used almost exclusively by the business and higher classes.

On the Way to Kymmene Bruk

Our first objective, Kymmene Bruk, was reached after a short journey by rail to Kouvola, thence by motor car. A fine opportunity was afforded from the latter of seeing the large barracks and commissars erected and used by the Russians when they were in power, now either abandoned or used by the Finnish Military. The mills of the Kymmene company with adjoining towns are ideally and beautifully situated, re-

PETTER OFF DUTY
"My if you knew how good dat tastes."

R. R. Station, Helsingfors

Laskela

minding one very much of the newest, up-to-date, progressive American industrial towns.

Between conferences at Kymmene and following them visits were made to other pulp and paper mills in Finland, as follows:

Laskela Bruks Aktiebolag, Laskela

Located a pleasant two hours' ride by automobile from Sordavala, a picturesque town on Lake Ladoga, the largest lake in Europe, and which separates Russia from Finland. Here a Pusey-Jones machine was operating on newsprint paper in a very efficient manner.

A. Ahlstrom Warkaus

From Wiborg with its quaint old buildings and typical Russian aspect by sleeper via Huotokoski to Warkaus. A well laid out plant, the paper mill being comparatively new, housing a large news machine furnished by a German builder, with space available for a second machine. The managing director, Baron Edward Cedarcreutz, very much interested in American and Canadian high-speed installations. Here occurred an unexpected but pleasant meeting with Mr. Kutter, technical manager of their several mills, a brother of the well-known and popular secretary of the Black-Clawson Company, of Hamilton, Ohio.

Kemi Cellulosefabrik, Karihaara

The most northern pulp mill in the world, producing 75 tons of fine easy bleaching sulphite, the greater part of which is exported to the States, was reached after traversing over two-thirds the length of Finland north and south, through the finest farming and industrial sections, including the large city of Tammerfors, known as the Manchester of Finland.

Captain Tinne, managing director, proved not only to be a fine executive and manufacturer, but is credited with several heroic exploits during the revolution in 1917, and one of which would make a story in itself.

Aanekoski Aktiebolag, Aanekoski

A Pusey-Jones machine was running here on magazine paper for Munseys. A second American machine of cylinder type over thirty years old, running on an all ground-wood board, used by a manufacturer in New York City for making paper plates. Bruno Ungern, managing director and a very entertaining host, is very proud of their new and handsome office recently erected.

G. A. Serlachius Aktiebolag, Mantta

Interesting experiments being carried out by their technical manager, Mr. Alfthan, in connection with utilizing red pine for sulphite pulp. Their pulp and paper mill is being rebuilt along modern lines.

Tornator Aktiebolaget, Imatra

Located close to the beautiful Falls of the Imatra (known as the Niagara Falls of Finland). Here an immense hydro-electric development is under way to supply power to the Finnish State Railways, which are to be electrified. Our P. M. 164 and P. M. 113 are in operation, the first named producing brown wrapping paper fron boiled groundwood, principally used i Russia, and the latter producing a ver fine grade of greaseproof.

Enso Aktiebolag, Enso

Largest sulphite mill in Europe, onl two years old, producing 125 long ton per day. Considered by many to be on of the best laid out sulphite mills in th world, many of the new and origina ideas used being the product of Mr Tamminen, managing director.

Resting Up for the Swedish Tour

Everything must have an ending an after a sojourn of five weeks in Finland, our faces were westward turned and the three days' return journey mad to Kristiania. Petter must needs rest bit at his comfortable home on Bygd Island, from the ardors of his nin weeks' trip in Finland, and several day opportunity was thus afforded of leisurely enjoying the beauties of the Norwegian capitol, nestling like a gem i its natural setting at the head of th fjord and surrounded by towering evergreen-covered hills. H. M. S. S. *Hood* *Repulse* and other visiting British wa vessels lay anchored along the fjor presenting a wonderful spectacle by both night and day.

Drammenselvens Papperbruk

Following conferences with Mr Christensen and Mr. Skjenneberg, man-

(At left), Petter Larsen, Sales Engineer, L & W.—(Center), C. G. W. Ramsay, Technical Manager, Kymmene A. B.—(At right), Gunner Bonsdorff, Technical Director, Kymmene A. B.

A. AHLSTROM, HARKAUS

Kunsankoski and Kymmene Fine Paper Mills

ing director and technical manager, spectively of the Union Company, and so with Mr. Rosholm and Mr. Kio- erud, president and director respec- ely, of Follum Wood Pulp Company, visit was made to Drammenselvens pperbruk at Geithus, where our P. M. 6 is installed. A pleasurable meet- g with Mr. Johannsen, managing di- ctor, who has been connected with the ll for almost thirty years, and has any interesting recollections of earlier sociation with Mr. Savery and others our pioneers.

Invades Sweden

After a fitting celebration of the urth of July as a guest of the senior ember of Lorentzen & Wettre, the in- sion of Sweden commenced. The mmer season presented the fullest op- rtunity of enjoying the trip, even ough somewhat hurried, through the autiful and prosperous agricultural ction of Southern Sweden, and the re industrial center section and the inity of Stockholm.

Visits were made to the following p and paper mills:

Stora Kopparbergs, Domnarfvets

One of the largest manufacturers of per in Sweden, as well as one of the est corporations in the world, their ganization dating back to A. D. 1225. ite a thrilling sight to behold, upon pping into the machine room of the per mill, seven machines with their ters, Jordans and other accessory chinery all under the one roof, but greater still that six of the machines bear our P. M. Nos. 190, 191, 235, 241, 248 and 249 of 107", 127", two 147", 137" and 158" widths respectively, all producing very efficiently on newsprint.

Mr. Bywall, technical manager; Mr. Lindell, paper mill manager; and Mr. Moe, engineer, are very proud of the production maintained and the manner in which the machines exceed their contract speeds. Mr. Lindell was formerly with Great Northern Paper Company, Millinocket, Me., and it was apparent that the experience gained there was being used to advantage.

Of further interest and a story of itself was the early connection between the company and the Swedish Colonists who settled in Wilmington—the first minister to the settlement in the new world, after later returning and becoming Bishop of Falun, (where their copper and silver mines are located), sent a silver communion service in early 1700 to the Church at Wilmington, still used for worship and known as Old Swedes Church.

Holmensbruks, Norrkoping

Three hours' ride by railroad south from Stockholm. Quite a large city with many industries, including a number of other paper mills. Mr. Grewin, technical manager, recently visited the States and Canada, and was well versed in high-speed production methods. Their machines of small size and moderate speed produce various printing papers.

Holmensbruks, Halstavik

Almost a three hours' journey by automobile north from Stockholm. A comparatively new and modern mill with two German machines each trimming 190", at present the widest running in Europe. One recently rebuilt similar to American and Canadian high-speed machines, even being equipped with Pope reel and air appliances also rolling out fourdrinier employing a unique tractor device. The rebuilt machine was running slightly over 700 feet, for reasons not apparent on the surface. Both machines, as elsewhere built by German manufacturers, are equipped with parallel belt drives in the basement, where ropes would operate to better advantage.

Mr. Wahren, mill manager, and son of the president of the company, called attention to a ship loading at their docks with newsprint for San Francisco.

Billeruds, A. B., Saffle

Probably one of the latest and most complete paper mills for the exclusive manufacture of "greaseproof," equipped with one machine of German manufacture, with space for a second, which will be installed in the near future. Mr. Mattas, technical manager, was at one time employed by Wayagamack and Southern Paper Company, and employs several American practices in the operation of their sulphite and paper mills. Dr. Arthur Klein, contributing editor of PAPER was, for several years, technical manager at Billeruds.

G. A. Serlachios, A. B., Tammerfors

Aannekoski A. B., Aannekoski

Wargons, A. B., Vanersborg

A rather old but efficiently operated mill manufacturing news and tissue paper. A very interesting feature was the news machine running at about 725 feet, completely equipped with ball bearings. Mr. Mahgren, managing director, is very broad in his views regarding ball-bearing applications on paper machines, and was keenly interested in the experiences with similar recent installations in the States.

This mill has what is believed to be the widest Yankee machine in the world, trimming 140" and running at 400 ft. on a 12-pound sheet.

Klippan Finappersbruk, Klippan

A two hours' rail journey from Malmo, most southern port and a large manufacturing and shipbuilding center. A very old mill with four machines producing very fine papers mostly for government use, and under more or less secretive process.

Tornatov A. B., Imatra

Billeruds A. B., Saffle

From Saffle to Malmo

The journey from Saffle down the west coast to Malmo was mostly through fine farming sections, with many American-made tractors and agricultural machinery in evidence. Opportunity was had of stopping off en route at Goteborg, to visit the large factory and main office of the S. K. F. Company, and meeting such prominent members of the organization as Mr. Pritz, executive director; Mr. Forsberg, production director; Mr. Gabrielson, sales director, and Mr. Dahlberg, advertising director.

Back to Kristiania

Once more back to Kristiania for a conclusion of all Scandinavian business; good-bye to Petter and the many other friends, tempered with Petter's promise that he would be with us in the States before the year was out, as he must again visit his many American friends, and take up the many conferences with manufacturers whose equipment he handles.

On the Stormy North Sea

The trip down the North Sea was one long to be remembered, not from a pleasurable viewpoint but from one of discomfort, the Atlantic having nothing on the North Sea when it comes to high winds and seas; but all was pleasant again when Antwerp was reached, and the journey made by rail to Paris, through Brussels and Northern France, where it was still possible to see evidence of the war ruins and the havoc created by the German invasion and occupation.

At the Papeterie de la Seine

Incidental to viewing the many wonders of Paris and environs—a visit was made to Papeterie de la Seine, at Nanterre, a short distance from Paris, one of the largest newsprint producing mills in France, making paper for *Le Petit Parisien*, one of the largest daily papers.

A pleasant welcome from our old friend Mr. Bedat, who visited the States in 1921. In the mill four paper machines, including three of American build—producing 150 tons a day, from sulphite and groundwood pulp, all imported from Scandinavia, and a new shredding and mixing system recently installed which was of considerable interest. The building for an additional machine was erected just before the war, and perhaps some day a modern, high-speed American machine may be installed.

Sittingbourne Mill of Edward Lloyd, Ltd.

Good-bye to Paris, then to Engla
via the Channel Ports, and on to L
don. A hurried visit to Edward Llo
Ltd., at Sittingbourne, Kent, where
P. M.'s 207, 210, 1140 and 1141 are
stalled. One of these machines, be
170" in width, was for several years
widest in Europe. An interesting
terview with their chief engineer,
Richards, a visitor to the States in 19
who enthusiastically referred to the
mill being constructed for two th
roll news machines.

Pulp from Grinder to Paper Mach

It was of particular interest to le
that one machine will be supplied
slush groundwood direct from grind
following the practice in the mod
American and Canadian mills, the ot
with stock from imported bale and
pulp shredded and mixed in beater
line with present practice. Ano
interesting feature will be specially
signed and constructed engine for d
ing the beaters, to operate under
lb. steam pressure, exhausing direc
the engine driving the paper mach
at 205 lb. pressure, which will exha
in turn, to the dryers at 10 pounds.

The return journey was made by
White Star Liner "Olympia" to
York, arriving exactly three mo
and five days from departure.

Of the many new and interes
conditions observed during the
perhaps the two most impressive
the conservation of the forests u
strict Government supervision, and
interest shown in American high-sp
production methods, indicating
modernizing of the majority of the
and paper mills as soon as Europ
conditions are stabilized.

Hervey J. Skinner ***Says:***

Notes of New York Trade

AT the annual meeting of the Paper Association of New York recently, Kit S. Walker, of the John F. Searle Company, was elected president for the ensuing year, succeeding J. C. Mallalieu, who had completed two terms as president of the organization. Other officers elected were George W. T. Skinner, of Skinner & Company, first vice president; William H. Holden, of Holden & Hawley, Inc., second vice president; B. T. Blake, of Marquardt, Blake & Decker Inc., secretary, and A. C. Damon, of Paul E. Vernon & Company, treasurer. Messrs. Holden, Blake and Damon were also elected directors of the association to serve three years. Assistant Secretary William C. Ridgeway reported that the membership of the association was 68, and that during this last year the Credit Clearance Bureau showed 1,619 clearances. The association's membership consists of practically all of the large paper jobbing concerns in New York City.

* * *

The Keith Products Company, paper dealers of 417 Layfayette street, New York, has filed notice of an increase in capital from $10,000 to $50,000.

* * *

The H. J. Grey Company, paper jobbers handling a general line of coarse papers, has removed from 163 Greene street to larger quarters at 228 East Forty-fourth street, New York.

* * *

Karl A. Lefren, formerly chief engineer of the Robert Gair Company, paper board and products manufacturers, has opened a consulting engineering office at 171 Madison avenue, New York, where he will engage in the practice of engineering in connection with power, paper mill and general mill construction.

* * *

Rocco de Fina & Sons, large dealers in cotton cuttings for paper mills, of 53 Mercer street, New York, have incorporated under New York State laws with a capital of $5,000.

* * *

Eric V. Bowater, of the Bowater Paper Company, 342 Madison avenue, New York, is due to return on the steamer Aquitania April 11 from an extended trip to Europe

* * *

The Gotham Tissue Corporation, of 925 Courtlandt avenue, New York, has filed notice of an increase in its capitalization from $25,000 to $30,000.

* * *

The Gowanus Waste Material Company, Inc., is the name of a new concern just organized in Brooklyn to pack paper supplies, and will specialize in rag stock. The company has a plant at 42-50 Second avenue, Brooklyn, which is equipped with up-to-date machinery.

* * *

Martin Cantine, president of the Martin Cantine Paper Company and chairman of the committee representing the coated paper manufacturers on the import duty on casein before the Tariff Commission, and Harry L. Derby, president of the Kalbfleisch Corporation, casein dealers and importers of 200 Fifth avenue, New York, are on a pleasure and business trip to Argentina, one of the principal sources of supply of casein. They have spent some time in Buenos Aires, and will visit elsewhere in South America.

WISCONSIN PLANS FIRE PREVENTION DRIVE

Danger Zones to Be Divided Into Districts and Fire Fighters Organized for Protection

A STATE-WIDE, conceted drive for forest fire prevention in Wisconsin will be undertaken this spring by the organization special fire prevention districts, according to announcement today by the state conservation commission. The entire forest section of the state which is subject to fire hazards will be grouped according to districts and fire fighters organized to protect each division, C. L. Harrington state superintendent of forests states.

The state department's plan of fire prevention is outlined in letters sent to all town chairmen in the state, enlisting their aid and support in carrying out the plan. The fire districts have not yet been fixed but will be designated within a short time, it is said. This will be the first time that the state has undertaken fire prevention by the district plan, according to officials.

The fire prevention campaign will be inaugurated during the Forest Protection Week, April 21 to 26th, which has been designed by President Coolidge. Governor Baline also will be asked to issue a proclamation enlisting the aid of cities and towns and various organizations in the state. The Federal government is expected to co-operate with the state department in its campaign.

"The conservation commission is going to make a special drive this year to reduce uncontrolled land fires in Wisconsin," declares the letter addressed to town chairmen by Conservation Commissioner Elmer S. Hall. "As study of the reports of town chairmen shows that 528,299 acres were burned over during 1923. It is safe to say that not less than a million acres were actually burned over Damage of over $200,000 resulted, not considering the loss of millions of young trees, thousands of birds, serious destruction of natural scenery, serious disturbances to game of all kinds, impairment of water flow—a loss which would run into millions of dollars if it could be tabulated.

"Town chairmen have a particular responsibility in connection with these fires. By law they are town fire wardens and are duty bound to do all within their power to prevent fire and to suppress fires should they start. They should make this fire questions one of the major items in their town affairs. The state this year will make a special effort to prevent fires in areas subjected to unusual risks, through organization of special fire protection districts. In this work the Federal government will participate. The President of the United States has seen fit to emphasize the importance of this question by officially designating the week of April 21st as Forest Protection Week. If there is a conservation warden in your county he is authorized to represent this commission in forest fire affairs."

Paper from Hemp

After a series of experiments, a successful process for the manufacture of paper from hemp has been devised and hemp will be manufactured this year at the St. Charles Paper Mill in Illinois. Four hundred acres of hemp was grown in the vicinity of St. Charles last year at a very good profit and plans are to increase the acreage this year considerably.

James R. Glass, Blenda L. Odman and Ray L. Odman have organized as Odman Bros., Inc. Place of business, 144 W. Kinzie St., Chicago. Capital, $25,000. Will manufacture and deal in paper, twine, etc.

Wisconsin Mill Notes

A severe sleet storm which passed over Wisconsin the last few days of March interferred with operations of mills, some being forced to close down entirely. Many power wires were brought down by the weight of sleet.

* * *

S. M. Carseen and Joseph Francour, Peshtigo logging contractors, have completed their contract near Republic, Mich., and returned to their homes with their equipment after a successful season.

* * *

J. H. Delbridge, president of the Marinette and Menominee Paper Company entertained members of the Marinette Rotary club at lunch at the Park Mills plant. Rotarians were served in the dining room in the office building by young women of the mill force. After a talk by Mr. Delbridge visitors were shown through the mill. Souvenirs of wrapping and tissue paper made in the mill were given each visitor.

* * *

The Peshtigo Paper Company sulphite plant will have its water supply increased with the completion of a new well being driven to a great depth to obtain a supply of pure cold water.

* * *

The Nekoosa mill of the Nekoosa-Edwards Paper Company completed the month of March without an accident, making a total of 55 days the company's mill at this point has operated without accident. The Wisconsin Rapids Tribune has agreed to print the record daily, showing the number of days since the last accident.

Timber is Damaged

A million acres of high quality yellow pine timber located in Klamath and Lake counties in Oregon was found to be seriously injured from the ravages of the western pine beetle. Government experts discovered that in ten years this beetle had killed not less than one billion board feet of yellow pine in this area. Steps were taken in 1922 to check the activity of the beetle in the ten billion feet of valuable yellow pine in the infested zone. Approximately half of this area is national forest and Indian reservation lands and the remainder is privately owned property.

Working in co-operation to stamp out this forest menace are the local representatives of the private owners, the state of Oregon, the forest service, and the Indian service. All are working under the technical advice of the federal bureau of entomology. The steps begun in 1922 to wipe out this meance are expected by the close of 1924 to have secured satisfactory results.

The control methods used consist of felling infested trees and burning them before the beetles emerge. By the close of 1924 it is expected that above $250,000 will have been expended in eradicating the pine beetles from the infested area. In order to prevent a recurrence of th betle plague a careful watch will be maintained. Surrounding this beetle-infested timber are three million acres of pine timber in Klamath Lake counties which are now comparatively free from a heavy beetle loss. This large area will receive careful attention that the beetles do not become a dangerous menace in this timber land.

CONDENSED PROGRAM FOR THE WEEK

American Paper and Pulp Association

Waldorf-Astoria, New York City

TUESDAY, APRIL 8, 1924

Forenoon

10:00	Technical Association of the Pulp and Paper Industry	Myrtle Room
10:30	Converting Paper Mills Association	Room 151
10:30	Salesmen's Association of the Paper Industry	East Room
10:30	Tissue Paper Manufacturers Association	Room 110
10:30	Waxed Paper Manufacturers	Room 109
11:00	Simplification Committee	Room 100

Afternoon

1:00	Cost Association of the Paper Industry	Room 115
1:00	U. S. Pulp Producers Association	Room 112
2:00	Gummed Paper Manufacturers Association	Room 109
2:00	Technical Association of the Pulp and Paper Industry	Myrtle Room
2:30	Cover Paper Manufacturers Association	Room 110

Evening—Dinners

7:00	Salesmen's Association of the Paper Industry Dinner and Smoker	Roof Garden
7:00	Tissue Paper Manufacturers Association	Hotel Astor
7:00	Technical Association Banquet	Hotel Commodore

WEDNESDAY, APRIL 9, 1924

Forenoon

9:00	Bristol Board Manufacturers Association	Room 114
10:00	Technical Association of the Pulp and Paper Industry	Room 110, 151, Myrtle Room
10:30	Cardboard Manufacturers Association	Room 109
10:30	Woodlands Section of A. P. & P. A.	Room 115
10:30	Wrapping Paper Manufacturers Service Bureau	Tea Lounge
10:30	Writing Paper Manufacturers Association	East Room

Afternoon

12:30	Papermakers Advertisers Club	Room 112
1:00	Waterproof Wrapping Paper Manufacturers	Room 100
2:00	Glazed and Fancy Paper Manufacturers Association	Room 109
2:00	Technical Association of the Pulp and Paper Industry	Room 110, 115, 151, Myrtle Room
2:00	Woodlands Section of A. P. & P. A. (Joint Program with the Technical Association)	Myrtle Room
2:30	Writing Association—Fine Paper Division	Room 114
2:30	Writing Association—Sulphite Bond Division	East Room

THURSDAY, APRIL 10, 1924

Forenoon

10:00	American Paper and Pulp Association, General Business Meeting	Astor Gallery

Afternoon

1:00	Binders Board Manufacturers Association	Room 112

The Editorial Page

Events of the Week

THE Paper Industries Exposition, or Paper Show, as it is called for short, is likely to be a fixed feature of the week of Annual Conventions. PAPER has kept in intimate touch with the developments and is aware that it is a cause of chagrin that our great American paper industry has not rallied more closely to the support of the Exposition. The Technical Association of the Pulp and Paper Industry has arranged for an afternoon session at the exposition at which the representatives of manufacturers and others who supply material to the mills will have an opportunity of demonstrating new inventions and processes, even if the particular manufacturer has not taken space in the exposition.

This must be taken as an evidence of the desire of the technical men in the industry to support the exposition. The exposition management have taken pains to provide suitable accommodations for the meeting and to advertise it fully. What most people look for, however, is stronger evidences of cooperation on the part of the individual members of the American Paper and Pulp Association, or of the association as a whole. We can imagine the joy with which a proposal on the part of the American Paper and Pulp Association to make collective exhibits of papermaking processes for its members would be received by the exposition management. But nothing of this kind is to be done and it will be left to certain individual exhibitors to illustrate by exhibits and otherwise the progress of papermaking in its technical aspects.

Just as last year, there will be a dearth of purely papermaking exhibits. Apart from displays of paper of special make like the plain and embossed glassine of the Westfield River Paper Corporation, in conjunction with their selling agents in New York; exhibits of paper bags, tissues, napkins, etc., by the Continental Paper & Bag Corporation; varied displays of Hammermill Paper Company productions showing the well known lines of bond papers and cover papers for which the company is famed, and an educational display by the Union Bag and Paper Corporation, which will include specimens of the wrapping paper, paper sacks and bags made by this firm, the greater part of the space in the exposition will be devoted to machinery equipment and mill supplies. The converters of paper appear to be taking more interest in the exposition than mill owners though, as in the case of the Hammermill Paper Company and the other firms named, there will be some noteworthy displays of fine papers for business and social purposes, as well as of wrapping papers and manufactured papers, like sacks and bags.

The tendency on the part of the larger pulp and paper manufacturers to let the machinery and mill equipment and supplies people dominate the Paper Industries Exposition is a matter of regret to all concerned in the success of the Annual Exposition, which should stand as a demonstration of the extent and importance of pulp and paper manufacturing among the basic industries of the country. Some thing should be done before the time comes around for another exposition to develop a closer contact on the part of the larger mills with the advisory committee of the exposition so that provisions may be made for their representation, with adequate exhibits at next year's Paper Industries Exposition.

Concerning the things that are to come up for consideration at the annual meeting of the American Paper and Pulp Association during Paper Week a good deal was said in last week's issue of PAPER. Likewise particulars were given of some of the important technical developments that are to be discussed during the sessions of the Technical Association. In addition to the subjects touched upon in last week's review, mention should be made of some important improvements in methods of drying paper which will be treated in a valuable article contributed by the inventor of the vacuum paper machine dryer. The importance of drying paper in a vacuum at low temperature hardly needs to be emphasized—every papermaker knows how the sheet is affected by excessive heat. It is no exaggeration to say that any successful method of drying paper in a vacuum on the ordinary fourdrinier machine will take rank as a discovery equal to that of Fourdrinier's invention of the continuous wire. The possibilities opened up by the application of the vacuum principle to the drying of paper are endless, chiefly, of course, with regard to paper made on the fourdrinier machine. There are other methods of drying fine papers and coated papers which have been introduced within a recent period that are likely to replace older systems. Developments in other industries, particularly the powdered milk industry, have pointed the way to the use of systems of drying for paper manufacturers that may revolutionize the drying systems now in use.

An impressive array of papers on technical subjects has been provided for the meeting of the Technical Association to be held at the Paper Industries Exposition on Thursday afternoon, April 10. Some fifteen papers are listed, ranging from the treatment of felts to the reeling and winding of paper. Most of the papers and discussions are of engineering importance but a talk will be given on the opportunities that exist in some of the southern States for the development of papermaking there. One of the things that a Scandinavian papermaker finds it difficult to understand in the operation of the American pulp and paper plants is the apparent general neglect of ball-bearing attachments and roller bearings on running equipment. For eight or nine years past at nearly all meetings of the technical association of this country and Canada papers have been presented which have treated of the effects of ball and roller bearings in speeding up production and we notice that another paper on the subject will be given at the T. A. P. P. I. meeting in the Paper Show.

NEW DEVELOPMENTS IN PAPERMAKING

Calender Bearings

In calendar rolls and similar apparatus, such as papermaking rolls in which the rolls are subjected to considerable pressure, the bearing at each end for either of both of the rolls is mounted in a housing D, as shown in the accompanying diagram which illustrates a method recently patented by the Hoffman Manufacturing Company in Great Britain. The housing D is supported upon a pair of oppositely disposed trunnions C, C_1 which turn in a bracket B. This bracket is rotatable about a vertical axis B^1 lying in the central vertical plane of the roll bearing. The brackets B for the top roll are carried by the cross-bars A which are fixed to vertical pillars P, and the bottom roll brackets are mounted on similar cross-bars, which are slidable on the pillars and are supported on hydraulic plungers. The projecting ends of the trunnions C_1 may be screw threaded to receive hand wheels, whereby the relative inclination of the axes of the rolls may be varied; or alternatively, simultaneous adjustment of both ends of the roll may be effected by rotating a worm L meshing with the worm wheels K engaging opposite threads on the trunnions C_1. Anti-friction bearings may be provided. The ends E' of the rollers E are reduced and tapered to receive sleeves F, having tapered bores. An inner race G is mounted on each sleeve F, and an outer race G' within the bracket D. An addition ball race J may be provided to take the end thrust caused by the relative inclination of the rollers

FIG. 1.

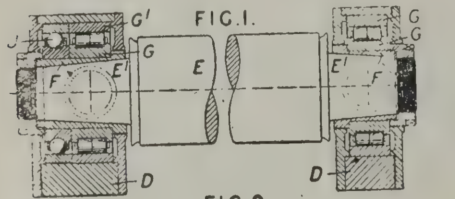

FIG. 2.

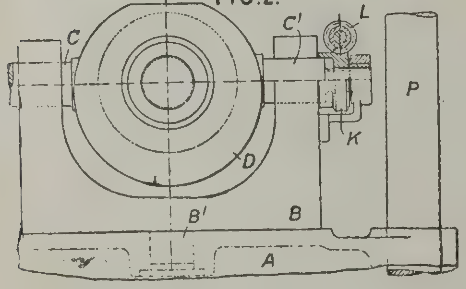
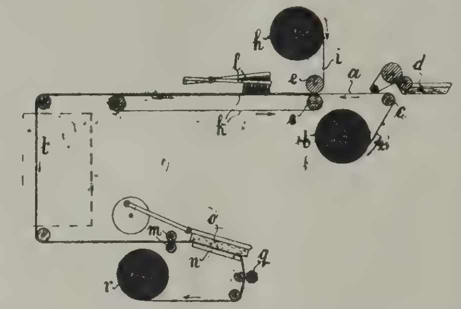


* * *

Velvet Finish Paper

A process for giving the surface of paper a velvet-like finish is patented in German Patent No. 364,568. The apparatus that is used in this process is seen in the accompanying diagram.

The paper web *a* is unrolled from the roll *b* and passes over the guide roller *c*. The arrangement of roll at *d* gives the top surface of the web a coating of adhesive. The paper web then passes along and comes in contact next with the guide rollers *e* where the adhesive-coated surface of the web is covered with a paper coating *i*. This paper unwinds from the roll *h*. The paper web which is now composed of two parts and which contains a top film of paper *i* then passes to an endless carrying belt *k* whereon the two sides of the paper, *a* and *i*, are intimately combined together by means of the movable brushes *l*, which travel back and forth over the surface of the paper. The combined paper layers then pass through a drying device shown at *t* and through the guide rollers *m* on the plate *n*. While passing over the plate *n*, the surface of the paper is subjected to the action of a sandstone *o*, which is worked by a cam arrangement and serves to roughen up the surface of the paper so that it attains the feel and appearance of velvet. Then the paper passes between the brush roller *q* and the finished paper is finally wound up on the roll *r*.



* * *

Transparent Paper

British Patent No. 208,410 is concerned with a process for the manufacture of transparent paper. In order to increase the transparency of purpose of a paer blank pressure is applied at the areas to be made transparent so as to consolidate the fibers. The medium for rendering these parts are then applied. Owing to enhanced receptivity less of the medium is required and a greater degree of transparency will be secured. Moreover the time required for drying will be shortened.

* * *

Guard Board for Papermaking Machine

The guard board that is used on a papermaking machine, which is patented in British Patent No. 201,895 is made in the following manner. It comprises a rigid back board which has a vertical movable jacket on it which is pressed against the surface of the roll. The board is employed for cleaning felt-jacketed couch rolls. The thickness of the blade is equal to the width of the bearing edge which will co-operate most efficiently with the felt jacket of the couch roll, so that as the blade wears away a uniform and efficient width of bearing edge is maintained in co-operative engagement with the felt jacket.

Waterproof Paper and Cardboard

In German Patent No. 388,063 there is described a process of waterproofing paper and cardboard in which crude benzol, creosote oil and other solvents in which pitch has been dissolved are employed. Then the paper is subjected to a high temperature, about 120° C, for a prolonged period of time so that the pitchy mass dissolved in the solvent is spread over the paper fibers which are impregnated with it, the solvents and oils being evaporated. The product is hard but not brittle and moreover it is odorless so that it may be employed in packing any kind of material.

* * *

Disintegrator for Woodpulp

The new machine which is patented in German Patent No. 364,266 and which is seen in the accompanying diagram is designed for the purpose of preparing a woodpulp in which it is possible to fix the length of the fibers at any desired point. The apparatus allows the attainment of fibers of any length and fineness. Owing to the manner in which the teeth of the grinding apparatus are formed they cannot be clogged up with material,

The device consists of a cylinder on which a system of grinding teeth is built as may be seen from the figure. The teeth are trapezoidal in form which is evident from figure 2. The cutting surfaces of the teeth shown in figure 2 is limited by the line 1-2, 2-5, 5-6 and 6-1. The length of the fibers in the ground wood pulp will depend on the length of the cutting edge 1-2.

Error Acknowledged

Through the inadvertence of the printer, the article headed "Shipping-Rolls of Paperboard" was accredited to the pen of B. T. McBain in last week's issue. While Mr. McBain is indeed a prolific writer he did not write that article, it being the product of James A. Cameron.

* * *

New Firm of Paper Dealers

The Eastern Specialties Company, Holyoke, Mass., recently organized under the laws of the State of Massachusetts to deal in all kinds of paper, is capitalized for $5,000. The officers of the company are, president, Charles E. Desmarais; vice-president, John N. L. Carriers; treasurer, Paul N. Desmarais.

A true philosopher can laugh at anything except monotony.

Measuring Water Squeezed from Paper Stock

An Invention for Measuring the Water Extracted by Press Rollsand Felt From Stock Running on the Fourdrinier Part Before the Web Reaches the Dryers

SOME new and useful improvements in papermaking machines are provided by devices patented by E. J. Wilson and Edwin A. Reese, who have assigned their interests in the invention to F. C. Huyck & Sons, of Rensselaer, N. Y. The following particulars are gleaned from the specifications of Patent No. 1,483,961, of February 19, 1924.

After describing the formation of stock on the Fourdrinier wire at the delivery end where couch roll removes a part of the water and presses the stock into compact web form, and the operation of the press rolls, each of which in turn removes a part of the water remaining in the web before it passes under the drying cylinders, the inventors of the new device, shown in the accompanying sketch, emphasize the necessity for removing the maximum amount of water by press rolls and felts.

Experience has shown, the inventors say, that the cost of removing moisture from the paper stock by the dryers is some thirty times the cost of removing the same amount of moisture from the stock by pressure applied by the couch rolls or by the rolls and felts of the presses. It is important, therefore, that the devices for removing water from the stock before it reaches the dryers and particularly the presses be maintained in proper condition most efficiently to remove the maximum amount of water, or that amount which experience shows will secure the most efficient and economical cooperation between the moisture removing mechanisms of the machine.

The present invention is said to enable any or all of the water-removing devices of the paper machine to be maintained in condition for the most efficient operation, and this result is secured by the provision of means for measuring the water being extracted by the water removing devices at any given point or at each of a plurality of points in the travel of the wet paper stock through the machine.

The provision of means for measuring the water being extracted by the pressure rolls and felt of a given press not only enables the press to be maintained in condition for most efficient operation but also enables the user of a machine to determine the efficient life of the felts, and also the character of felt which may be most economically used in the manufacture of a given product.

In case there is a material and maintained decrease in the amount of water being removed, which will occur when the felt is no longer operating at maximum or economical efficiency, the means for measuring the amount of water being removed will indicate this fact to the operator so that the continued and uneconomical use of a worn-out felt may be avoided. By comparison of the amounts of water removed by felts of different character when operating at maximum efficiency in connection with a comparison of the life of the felts the user may determine what character of felt is most economical, for instance, whether it is more economical to use a comparatively light or a comparatively heavy felt, or a felt of one design as compared with another. In other words, the invention enables the user of the machine to determine the condition and equipment of the water removing devices requisite for uniformly economical operation and to maintain approximately such condition and equipment.

Any suitable means for measuring the water being removed from the wet stock by the water removing devices may be utilized although it is preferred to thus measure this water by causing it to pass through a flow nozzle, which is connected to operate a recording flow meter, since this means may be readily installed in applying the invention to existing machines and when installed will measure accurately and record the water being extracted from the paper stock by any given mechanism.

The invention will be readily understood from the accompanying drawings which illustrate diagrammatically the application of the preferred form of the invention to two of the presses of a Fourdrinier paper machine.

In the drawing the Fourdrinier wire upon which the wet paper stock is formed into a web is indicated at 2, the lower couch roll about which the wire passes is indicated at 4 and the upper felt jacketed couch roll which removes a part of the water from the stock and presses it into compact web form is indicated at 6. The continuous web of wet paper stock formed on the wire passes from the couch rolls onto the endless 8 of the first press by which it is carried between the upper and lower press rolls 10 and 12, where it is squeezed between the upper roll and the felt and a further part of the water is removed therefrom. From the first press the paper stock passes onto the felt 14 of the second press, by which it is carried between the upper and lower press rolls 16 and 18 where a still further part of the water is removed by compression of the stock between the felt and upper press roll. In like manner the web passes successively through whatever series of presses may be incorporated in the machine and from the last press passes to the heated drying and calendering rolls of the dryer.

In applying the present invention to a machine such as above indicated means is provided for measuring the water being removed by any one or more of the mechanisms which remove successive portions of the water from the wet stock in its travel to the heated cylinders of the dryer.

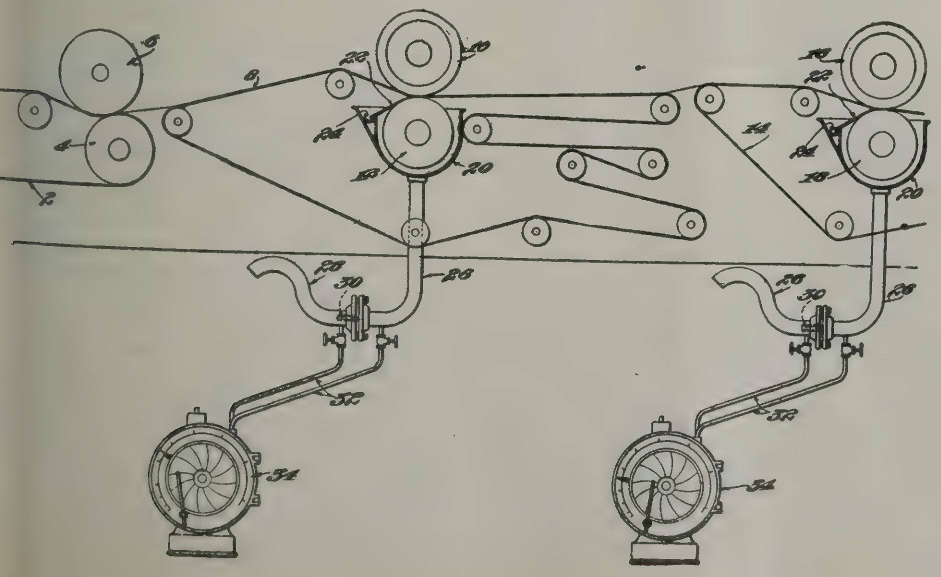
In the construction indicated in the drawings means is shown for measuring the water removed by the first and for measuring the water removed by the second of the presses, it being understood that similar means may be utilized in connection with the other presses, with the couch roll, or with other mechanisms which remove water from the wet stock during its passage through the machine.

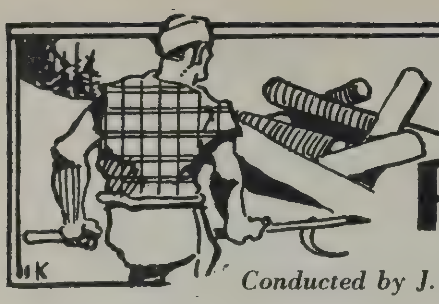
In the construction illustrated the water removed from the paper stock by the felt and pressure rolls of the first press is collected in a trough 20 underlying the lower roll and provided with a doctor blade 22 engaging the lower roll 12 near the bight of the rolls and delivering the water removed at this point into an auxiliary inclined trough 24 from which it passes into the trough 20. The water collected in the trough 20 passes down through a pipe 26 leading from one end of the trough and this pipe is provided below the bottom of the trough with a horizontal portion 28 within which a flow nozzle 30 is located.

The end of the pipe beyond the flow nozzle is bent upward and has its discharge end arranged above the horizontal portion so that a head of water is maintained in the pipe and a flow of water through the nozzle dependent upon the amount being removed from the wet paper stock by the cooperation of the felt and press rolls.

The flow nozzle is connected by pipes 32 with a flow meter 34 of usual construction which is operated by the flow of water through the flow nozzle and indicates and records the rate of flow and consequently the amount of water being removed by the press. The amount of water being removed by the second press is measured and recorded by a mechanism which is the same as that applied to the first press.

During the operation of the machine the amount of water being removed by each press will be indicated and recorded on the time chart of the corresponding meter and will inform the operator whether each press is operating uniformly to remove the amount of water requisite for its most efficient operation and whether the amount of water being removed by each press bears that relation to the amount of water being removed by the other presses which continued use of the invention may have demonstrated will secure the most economical results. The meters will also indicate to the operator when a felt becomes so worn that it can no longer be retained economically in the press so that continued use of the felt after it has ceased to operate efficiently may be avoided.





FORESTRY in the PAPER INDUSTRY

Conducted by J. R. Simmons, Secretary Forester, the New York State Forestry Association

THE MEAD COMPANY'S PRACTICAL EXPERIMENT

Hardwood Seedlings and Cuttings Planted in 1909 Yield Definite Information To Company

THE story of how one paper company has experimented in the practical practice of forestry in growing hard woods has been told by a report by Karl A. Swenning, forester of the Mead Pulp & Paper Company, on cottonwood and silver maple on river bottom lands. His review of the work that has been done since 1909 tells how three types of planting stock have been used—straight cuttings, rooted cuttings and seedlings of cottonwood; straight cuttings of willow; and one-year-old silver maple seedlings. If soil conditions are very favorable and planting is followed within a very few days by rain, straight cottonwood cuttings give very satisfactory results. "We have secured a 90 percent catch with these optimum conditions," he says. "When such conditions do not exist, however, the results are most unsatisfactory."

When the soil is a good sand loam mixture and where the fertile top soil has not been entirely washed away, seedlings can be successfully used. One-year-old stock 12-18 inches tall, costing about $3.50 per M, can be planted at a cost of $5.10 per M. The average is 85% on the soils just described.

On poorer soils, those that have been badly washed and either the top soil entirely removed or else covered with a thick layer of sand and gravel, seedlings do not give good results. On such sites rooted cuttings must be used. The cost of growing these is high, approximately $12.00 per M, and the planting cost is much in excess of any other, averaging $8.65 per M. Results, however, justify the cost, for an average catch of 90% can be secured. Willow cuttings and silver maple seedlings can be planted at approximately the same cost as can those types of cottonwood stock. Maple seedlings can be raised for $1.65 per M.

A summary of the total costs of the various types of planting is as follows:

With straight cuttings	$5.40 per M
With rooted cuttings...........	$20.65 per M
With seedlings (1 yr.)	$8.60 per M

In planting straight cuttings of willow or cottonwood, the ground is usually in such shape that the sticks can be forced into the ground without any preparatory hole being made for them. For cottonwood and silver maple seedlings a hole is made either with a spud or mattock, depending upon the looseness of the soil. Where the spud is used one man sets the trees for two spud men; where the mattock is used one man both digs the hole and sets the stock. Rooted cuttings, because of the extent of their root system, require the plowing of a furrough the length of the row to be set. The digging of separate holes for each plant is too long and too expensive a proposition.

The operations in cottonwood have been based on a twenty-year rotation, as it is believed that at the end of twenty years the trees will have reached their maximum growth and that from then on the number of trees lost each year will balance the accruing growth. The growth peak may be reached before that time and other unforseen factors may enter the problem, but only by following through what we have already begun can we say definitely this or that is our best rotation.

Working on a twenty-year rotation, this company has used two principles of thinning. With one method it thins once when the trees are ten years old—with the other twice, at six and at twelve years. On one area that was thinned at twelve years there has been established a sample plot with an unthinned check plot close at hand.

The two plots which four years ago had a difference of thirty-nine trees, the larger number being on the unthinned plot, now differ but seven trees. In the matter of growth the thinned plot does not show any marked gain over the other. The actual loss in stumpage on the unthinned plot has been very high and on the thinned area this loss has been utilized.

The results of the tests seem to indicate that a 33% thinning has an advantage over a 50% thinning and a very decided advantage over a plot that was not thinned at all. Both diameter and height growth have been accelerated on the moderately thinned plot to a degree far beyond that of the other two. The real test of the efficiency of the two methods will show to much better effect when the time comes for the second thinning.

Under the present plan of management it is proposed to try to produce two crops of timber from the same acre of land that before produced but one. On the typical cottonwood lands of the Mississippi River two conditions exist; first, a stand of pure cottonwood; and second, a cottonwood and silver maple mixture. In the former stands the crown density is approximately 0.55. Under such conditions weeds grow in profusion and the ground cover is a tangled mass of grass, horse weeds and burrs of various sorts. This is typical of the condition that exists in the plantations. In the second type of stands, where the cottonwood and maple are in mixture, the cottonwood is the dominant tree with the maple forming a solid second story below. Under such stands the ground is practically clear of weeds, all available light space is utilized for wood production and the cord wood yield per acre is increased by more than a third. The effort now is to copy that natural mixture.

A brief resume of the essential facts given may be of interest, says Mr. Swenning:

"1. Cottonwood seedlings, maple seedlings and rooted cottonwood cuttings have proven to be the most satisfactory planting stock.

"2. The rotation basis for cottonwood for pulpwood purposes has been empirically placed at twenty years.

"3. The under-planting of cottonwood with silver maple shows evidence of good future possibilities.

"4. Planted stands of cottonwood compare favorably in growth with natural stands.

"5. Two methods of thinning are being tried, with one showing decided advantages over the other.

"6. In fair stands of twelve year old cottonwood we have secured a yield of 1.36 cords per acre per year.

"7. In average stands of planted cottonwood we anticipate a yield of 1.5 cords per acre per year."

* * *

Legislation in New York

A bill mentioned in PAPER last week, providing for a nine-headed commission to investigate and report in 1925 on a forestry policy for the state of New York, and limiting the investigation and report to privately-owned land, has appeared as Senate Bill 1788 by Mr. Rabenold.

The revised bill reduces the number of commissioners to seven by dropping off the Chairman of Conservation of the Senate and the Chairman of Conservation of the Assembly. The groups represented would include: The New York State College of Forestry, The New York Section of the Society of American Foresters, The Department of Forestry of the State College of Agriculture at Cornell, The New York State Forestry Association, The Association For Protection of the Adirondacks, The Empire State Forest Products Association, and the Conservation Commission.

A forest taxation bill, based on the Massachusetts law, is under preparation. This bill would undertake to encourage the practice of forestry on privately-owned land by exempting the owner from burdensome taxation while the trees were growing. The yield tax advocates in New York are not yet discouraged, although this represents at least the sixth honest effort to get relief from taxation on growing timber.

* * *

Nursery Practice

Paper and pulp companies starting their own nurseries can be depended upon to take the necessary precautions in regard to location, species and general management. Too much emphasis, however, can not be placed upon the care of the young seedlings during the "damping off" age, and this care begins with the selection of the nursery site. The nursery should be placed on well-drained land and never on moist hot land, else at the age of two or three weeks the seedlings will be attacked by a disease which affects the lower portion of the stem and causes death by the whole seed bed at a time.

A small amount of damping-off is apparent in most nurseries, even the best. There are several treatments and preventatives, one of the best being dry sand sifted lightly over the beds in moist hot weather. The acid treatment which often becomes necessary appears to have a beneficial effect on the chemical reaction of the soil for the growth of western yellow pine and jack pine, according to a recent Forest Service announcement.

New Data On Tree Spacing

Last fall PAPER published the results of an investigation on the growth of planted forests, mentioning the twelve or more oldest forest plantations in the United States. When that investigation was first made, a plantation of six acres in the southern part of Massachusetts was calipered and the figures saved for future reference, the age of the plantation being such that it could not be included in the study at that time.

In a personal letter to this column the Chief Forester of Massachusetts gives additional data on the plantation, based on an investigation made less than one month ago. The figures are of value to the paper industry chiefly from the standpoint of the spacing of trees in reforestation work, and seem to add weight to the general rule of 1000 trees to the acre (or a spacing of approximately 6 feet by 6 feet).

Quoting from the letter, "It is quite evident from the appearance of this plantation that the spacing 10′ x 10′ is too wide. The trees are short and scrubby (33 feet high) and even at the present age, about thirty years, there are comparatively few trees that can be removed for thinning." The following is a record of the measurement:

Area, 6 acres		
Class I trees:		
1721	58,340 ft.	118 caliper cds.
Class II trees:		
274	5,080 ft.	7½ " "
1996 trees	63,420 ft.	125 caliper cds.

* * *

New Wood for Papermaking

Samba (*Triplochiton Scleroxylon*), occurring in Guinea, the Ivory Coast, Dahomey and the Cameroons has been investigated for use in papermaking. The wood contains 60 percent of cellulose and 39 percent of lignone, but only 33 percent of cellulose was obtained in the technical tests, the paper produced being of common type. When bleached, the pulp was a dull white, slightly rough to the touch and fairly supple. Resistance to tearing, rubbing and other tests was mediocre. Very thin sheets can be obtained, the felting power being 0.015. With energetic treatment the lignone is easily eliminated, and the wood seems well suited for papermaking.

* * *

Conservation Week in East

April 5th closed the special observance of Conservation Week in some of the Eastern states, where proclamations were issued calling attention to the need for greater effort in public education and in reforestation. Thirteen inches of snow blocked many reforestation projects that were under way, but the work of public education went on unhampered. Two facts of importance are brought out by the week's observances, namely, that there are not enough state trees to go around, and that some of the industries, recognizing this, are learning to shift for themselves in the matter of idle land reclamation. At the rate we are going the proclamations in 1925 will call for enlargement of our nurseries to keep pace with the "plant more trees" program.

* * *

Yield of National Forests

The eight National Forests of the state of Washington yielded 142,153,000 board feet of lumber during 1923, the value of which was $257,796. There were actually sold from these forests during that period 252,657,000 board feet, much of which had previously been cut under Government contracts.

* * *

As a nation we are taking better care of our arms and legs. The production of artificial limbs decreased 25.7 per cent in the United States from 1919 to 1922, says a governmental report.

NATIONAL FORESTRY BILL IS BEFORE CONGRESS

Bill Is Reported Out by the Committee on Agriculture

THROUGH a series of steady advances the Clarke-McNary Bill has now come out of the House Committee on Agriculture, still potent, and bearing no serious marks of battle. It has the distinction of being the first forestry policy bill ever to reach the floor of Congress. Hearings in the House on March 25th and 26th were followed by two days of hearings by the Senate Committee on the McNary Bill, companion of the Clarke measure. The McNary end of the legislation will undoubtedly be reported promptly in the upper house.

Only minor changes were made by the House Committee in the original bill, such changes as were made being intended to help the farmer in the practice of forestry on his woodlots. The favorable reporting of the bill is a notable accomplishment for the whole forestry movement in the United States.

On March 28th, Chief Forester Greeley told the Senate Committee on Agriculture and Forestry that the work of the Senate Select Committee on reforestation, which resulted in the McNary-Clarke forestry policy bill, was the most exhaustive investigation that had ever been made of the subject. The committee visited every principal forest region of the United States and held twenty-five hearings in as many different places. Colonel Greeley explained that the bill deals with approximately one-fourth of the land area of this country, and has two main purposes: First, the extension of public ownership, both federal and state, of forest lands and lands suitable for forest growth, and the broadening of the forms of public administration; Second, to encourage reforestation of lands in private ownership. He then took up the bill section by section, discussing it from an administrative standpoint.

Governor Gifford Pinchot of Pennsylvania was present and Colonel Greeley yielded his time so that the Governor could express his views to the Committee. The Governor explained that he did not want to say anything that could be construed as antagonistic to the McNary Bill. He favored it in a broad way but insisted that it did not go far enough. After brief reference to the McNary Bill Governor Pinchot launched into a critical analysis of the Capper Bill, which is also before the Committee on Agriculture and Forestry. Colonel Greeley continued his testimony on the following morning, and as this article is being written the people of the country, and particularly the industries, are awaiting with expectation the announcement that the McNary measure has been reported out of committee and has come before the Senate.

* * *

To Cut New Crop

Reforestation on a commercial basis has been started in several sections of the country, the Senate Agriculture Committee was told today by W. B. Greeley, chief of the forest service. The committee is holding hearings on the McNary reforestation measure.

Southern pine producers in the South expect to cut a crop for wood pulp in twenty-five years, Mr. Greeley said, and to have ordinary building lumber within forty years. Producers of redwood on the Pacific Coast look for a first crop in forty years to be used largely for railroad ties. Sixty years, said the forest head, will be required to produce higher grades of redwood timber.

A man went into Cohen's Book Store and asked: "Have you a copy of 'Who's Who' and 'What's What' by James K. Jerome?"

Cohen replied, "No, sir, but we got 'Who's He' and 'Vat's He Got,' by Bradstreet."

NEWS FROM CANADA

CANADA ALMOST EQUALS U. S. PRODUCTION

Newsprint Mills Now Reach a Record Figure That Closely Approaches United States

THE latest figures published by the Canadian Pulp and Paper Association show that the output of Canadian newsprint mills is now very nearly equal to that of the United States. Their output had doubled since 1917, while during the same time that of American mills has increased by only 14.2 percent.

The rapid development of the Canadian pulp and paper industry, especially that part of it which has to do with the production of newsprint, is directly due to the equally remarkable demand from the United States. This is being brought home to the Canadian industry by the falling off of the export trade generallv (outside of the United States) especially during the last year. Exports of paper products to Australia have fallen away to a very low ebb, and those to Great Britain are also much less than formerly.

In a recent Canadian publication attention was drawn to the fact that ten years ago American mills were able to meet all but a small percentage of the domestic requirements for newsprint; but during the last decade the output has been steadily falling behind the demand. While the use of newsprint has increased, the depletion of the pulpwood supplies of the Eastern and Lake States has permitted only a moderate increase in American production.

It is a noteworthy fact that the value of Canada's exports of newsprint have increased from less than $4,000,000 in 1912, to over $80,000,000 last year. It is not very long ago that Canada's pulpwood resources were considered of very indifferent value; but with the demand for paper from the United States, combined with the inroad made by fire and insects, all this has been changed. Now Canada's forests are considered to be one of her valuable assets.

The increasing part played by pulp and paper in increasing the commercial importance of Canada may be seen in the fact that today paper stands second only to wheat in order of importance among her exports. Ten years ago her exports of paper were valued at less than $7,000,000, or about one-third the value of cheese alone. This year all the butter and cheese exported from Canada's 3,000 dairy factories, plus all the apples and all the fruits from the famous orchards of Ontario, British Columbia and the Annapolis Valley in Nova Scotia, plus all the cattle and fish exported are scarcely equivalent in value to the exports of Canada's paper products. The pulp and paper industry is now one of the pillars of Canada's industry, and is doing more than anything else to keep her exports where they are.

* * *

Lieut.-Col. Thomas Gibson, Toronto, vice-president of the Spanish River Pulp and Paper Mills, Limited, who has been away from his office owing to illness for some weeks, has gone to Bermuda to recuperate.

START EXCAVATION FOR NEW MILLS

Sites Selected for Humber Bay Plants in Newfoundland

THE pulp and paper mills to be built at Humber Bay in Newfoundland will be among the most important pulp and paper manufacturing plants in the British Empire. The sites for the mills have already been chosen. These are located at a center known as Corner Brook. A start has been made in the excavation work for the new mills, the anticipation being that work will be rushed so that the mills will be available for operation early in 1925, either partly or wholly.

In addition to constructing the pulp and paper mills, about 1,000 houses will be built for workmen. A hundred of these houses are now being built, and indications are that the entire number will be ready for occupancy next year. These houses will be built in a regular town site, which has been approved by the town planning authorities of Newfoundland. In addition to the houses, a hotel will be built for the use of company employes. This hotel will contain 100 rooms in addition to a swimming pool, bowling alley, billiard hall and gymnasium.

Newfoundland and Canada Back Enterprise

At Corner Brook also considerable reclamation work has been effected. Corner Brook is really an inlet from the Bay of Islands. Much of this inlet has been filled in. Piers will be built and a railroad constructed on the reclaimed territory. A start has already been made in building the piers and the railway. All of the shipping will be done from these Corner Brook piers, which will be situated in a natural harbor, on the coast. Shipping to Great Britain and the United States and Canada will be greatly facilitated by the choice of Corner Brook as the shipping as well as manufacturing center. The British and Newfoundland interests who are interested in this project, probably the most important ever proposed for the island, expect to employ about 5,000 to 6,000 men, when manufacturing operations start. That the year 1925 will witness the opening of such operations is the general feeling. The Newfoundland government and the British government are financially interested in the gigantic scheme, together with private interests. But for the support offered by the Newfoundland government, the big industry would not have gone to Newfoundland, but would likely have been located in eastern Canada.

* * *

Booklet On Industry

An interesting and instructive booklet on the newsprint industry of Canada has just been issued by Nesbitt, Thomson & Co., Limited, a Toronto financial house. The booklet describes briefly the methods of production of groundwood, sulphate and sulphite pulps, and their use in papermaking and it goes on to indicate the rapid growth of this basic industry, showing the natural advantages for economical production possessed by the Dominion.

INTERNATIONAL AND THE PREMIER IN DISPUTE

Correspondence Now Being Published Between Manufacturer and Premier Veniet

PHILIP T. DODGE, president of the International Paper Company, and P. J. Veniet, premier of New Brunswick province have been exchanging some letters in regard to the proposed hydro-electric development work at Grand Falls on the upper St. John River. The International Paper Company controlled the water power rights at Grand Falls for some years by agreement with the New Brunswick government. However, these rights were revoked on the ground of inaction. The government announced that it would undertake the development of the water power on its own initiative. Veneit has now offered some of the letters for publication. He states that in one of his letters, the president of the International Paper Company wrote in part: "There are reasons why the provincial government could not make the development in the face of opposition from us without international complications. There will be no opposition on our part to the transfer of the properties to the province or its development by the province unless we are treated unfairly."

Veniet states he replied that he hoped this was not given as a threat and asked Mr. Dodge to be more specific. In another letter, Mr. Dodge wrote. "I have refrained from giving the correspondence to the press for publication." In reply to this Veniet wrote, "I am only too glad to have the correspondence published, so that the public might see the way the game is played."

Veniet states in his last letter to the International head, he asked the latter to state the claim of the company against the province in detail. He says Mr. Dodge did not give this statement, merely alluding to the company's leases and options on the Maine side of the St. John River near Grand Falls. That the International will file a claim because of the loss of the Grand Falls rights is believed to be assured. It is believed also that some of the property leased to the company must be taken over by the province of New Brunswick in proceeding with the hydro-electric development, and the company will seek compensation for such transfers. The entire matter will be threshed out in the New Brunswick assembly, to which the definite claim of the International may be presented later.

* * *

Enforced Idleness

A number of the pulp and paper companies in Ontario and Quebec will have an enforced idleness of about ten days beginning April 1. The Dominion Government has notified the mills of cleaning and repair operations to be carried on in the Lachine and Welland Canals which will necessitate the closing down of several mills in the Niagara district as well as the Mille Roche mill of the Provincial Paper Mills Company. The mills will take advantage of the shut-down to make the necessary repairs and renovations.

Safety Association Meets

The annual meeting of the Ontario Pulp and Paper Makers' Safety Association was held in Toronto last week when reports of the year's work were presented and officers elected. An interesting feature of the meeting was the warding of places in Classes A and B, in connection with the annual accident prevention competition. The winners in Class A, which includes mills employing 200 people or more, are the Riordon Company, Limited, Hawkesbury, Ont., with a record of 60 non-fatal accidents, involving lost time of 481 days, which is equal to 1.1 days lost time per full time employed. The winners in Class B are the Miller Brothers Company, Limited, of Glenmiller, Ont., with a record of one non-fatal accident, involving lost time of 12 days, which is equal to .27 days lost time per full time employed. At a meeting of the directors H. F. E. Kent, of Toronto, ex-president of the Canadian Pulp and Paper Association, was elected president and L. R. Wilson, of the Abitibi Power and Paper Company, Limited, vice-president. A. P. Costigan was reappointed secretary-engineer.

* * *

What Will He Do?

The arrival of Lord Rothermere in Canada is being awaited with interest in pulp and paper circles, for it is thought that it may have a bearing on developments in the Chicoutimi pulp group. It is known that Sir William Price, one of the biggest figures in the Canadian industry, has been in London for some time, and rumor connects his presence there with Chicoutimi matters. In some quarters it is thought that the Rothermere and Price interests may combine to take over Chicoutimi. On the other hand there is opposition to the proposed merging of all the Lake St. John, Chicoutimi and Saguenay pulp and paper interests into one giant corporation, and it is believed that those holding this view have strong financial support. In the meantime it is understood from the liquidators of the Bay Sulphite Company, the fate of which is closely linked with that of Chicoutimi, that the mills of the former at Chandler, which have been closed for some time, will reopen shortly. The receivers will operate the mills, but only in a temporary way.

* * *

Cut Down Production

Although the normal production of kraft pulp at the Dryden Paper Company's plant at Dryden, Ont., is about 65 tons a day, since the receivership the company has cut down this production to about thirty tons of pulp. They are now making sufficient pulp for their own requirements only and are selling practically no pulp in the United States markets. The company is manufacturing a complete line of machine-finished kraft, dry and water finished manilas, machine-glazed pure kraft and machine-glazed No. 2 kraft, as well as a considerable amount of sheathing papers. Naturally the cutting down of operations in the pulp mill has cut the company's wood consumption in half. The company states that there was considerable competition in the Dryden district this year in the purchase of wood from American mills, but it is understood that the settlers have not sold all of the wood produced.

* * *

Mill Making Progress

Good progress is being made in the construction of the new pulp mill for the Great Lakes Pulp and Paper Company at Fort William. It is expected that by April 16, the power line from the Bare Point station to the Great Lakes plant will be ready for the transmission of current.

PAPER EXPORTS NEAR PAR

Slightly Less in February than January but Larger than in February Last Year

EXPORTS of paper from the United States during February amounted to $2,045,961, a decrease of $5,623 compared with the previous month, but an increase of $86,370 compared with February, 1923. The chief gains were made in exports of paperboard and strawboard, which increased in value 21 percent compared with January and 57 percent compared with February, 1923, and in exports of hanging paper, which increased 46 percent compared with last month, and 82 percent compared with a year ago. Shipments of carbon paper, envelopes, wrapping papers (other than kraft), and toilet paper during February also show considerable gains over both the previous month and last year, while exports of greaseproof and waterproof papers, newsprint, towels and napkins, and sheathing and building papers, although somewhat under those for January still show a substantial increase compared with February of last year.

Big Gain in Canadian Exports

According to the report issued by the Canadian Pulp and Paper Association, the exports of pulp and paper from Canada in February were valued at $10,947,199, an increase of $47,149 over the total for January. Comparison with the returns for February, 1923, show a very considerable increase in the value of the pulp and paper exports for last month, the value this year exceeding that for 1923 by $963,531.

The gains were chiefly made in shipments of newsprint, which amounted to 99,621 tons, valued at $7,359,535, last month compared with 84,395 tons, valued at $6,360,140, during February, 1923, and in shipments of sulphate (kraft) pulp, which show an increase of from 9,525 tons to 12,298 tons in quantity and $618,342 to $725,926 in value. Exports of book, bond and writing, and kraft wrapping paper, and of unbleached sulphite and mechanical ground wood pulps fell off to some extent last month, both in quantity and value, and exports of bleached sulphite declined somewhat in value, although the quantity shipped, 14,713 tons, was 17 per cent above that for February, 1923.

* * *

To Build Homes

The Continental Wood Products Company, of Elsas, Ont., state that they are preparing to build a number of new cottages in addition to those they built last summer for the housing of their employees and those engaged in the erection of the new kraft mill. Work on the new power dam had to be discontinued on account of the ice in the river but will be resumed as soon as the ice goes out and they are able to use boats. The mill cut this season will be about double that of last season which is accounted for by the fact that the company will be cutting much heavier lumber and timber for use in the construction of the new plant. The kraft mill, when completed, is expected to be one of the best equipped on the continent.

* * *

Have Attractive Showroom

Warwick Bros. & Rutter, manufacturing stationers and paper box makers, Toronto, have fitted up a very attractive showroom in their plant on King Street for the display of their 1924 lines of De Lux papetéries. The display is a very artistic one, including as it does many new and novel designs in the line of fancy stationery boxes.

Hayward Promoted

Promotion of R. A. Hayward to the general superintendency of the Kalamazoo Vegetable Parchment Company plant to succeed Jacob Kindleberger is the most important executive shift in the Kalamazoo Valley paper mills this year. The change became effective April 1. Mr. Kindleberger, who built the plant up from a small concern to a plant worth several millions, will retire as general manager, but will retain the presidency of the company.

The change, announced by Mr. Kindleberger, is made to relieve the latter of all detail matters, leaving him free to devote his time to matters of broad policy. Mr. Hayward has been connected with the mill as a consulting engineer during the last year. He formerly was a member of the faculty of the University of Michigan department of engineering, teaching papermaking engineering. His family will move to this city some time during April.

* * *

Coughlin With Franklin

Edward T. A. Coughlin of Kalamazoo, vice-president of the American Pulp and Paper Mill Superintendents' Association, has accepted the general managership of the Franklin Coated Paper Company, of Franklin, O. Mr. Coughlin will leave in a few days to assume his new duties. He has been associated for ten years with the Monarch Paper Company, now a part of the Allied Paper Mills, Inc., both as superintendent of the coated paper department and in the technical division. He is a graduate of the University of Maine. He has been active in Michigan papermaking circles and a leader in the movement for the formation of divisions the Pulp and Paper Mill Superintendents' Association.

* * *

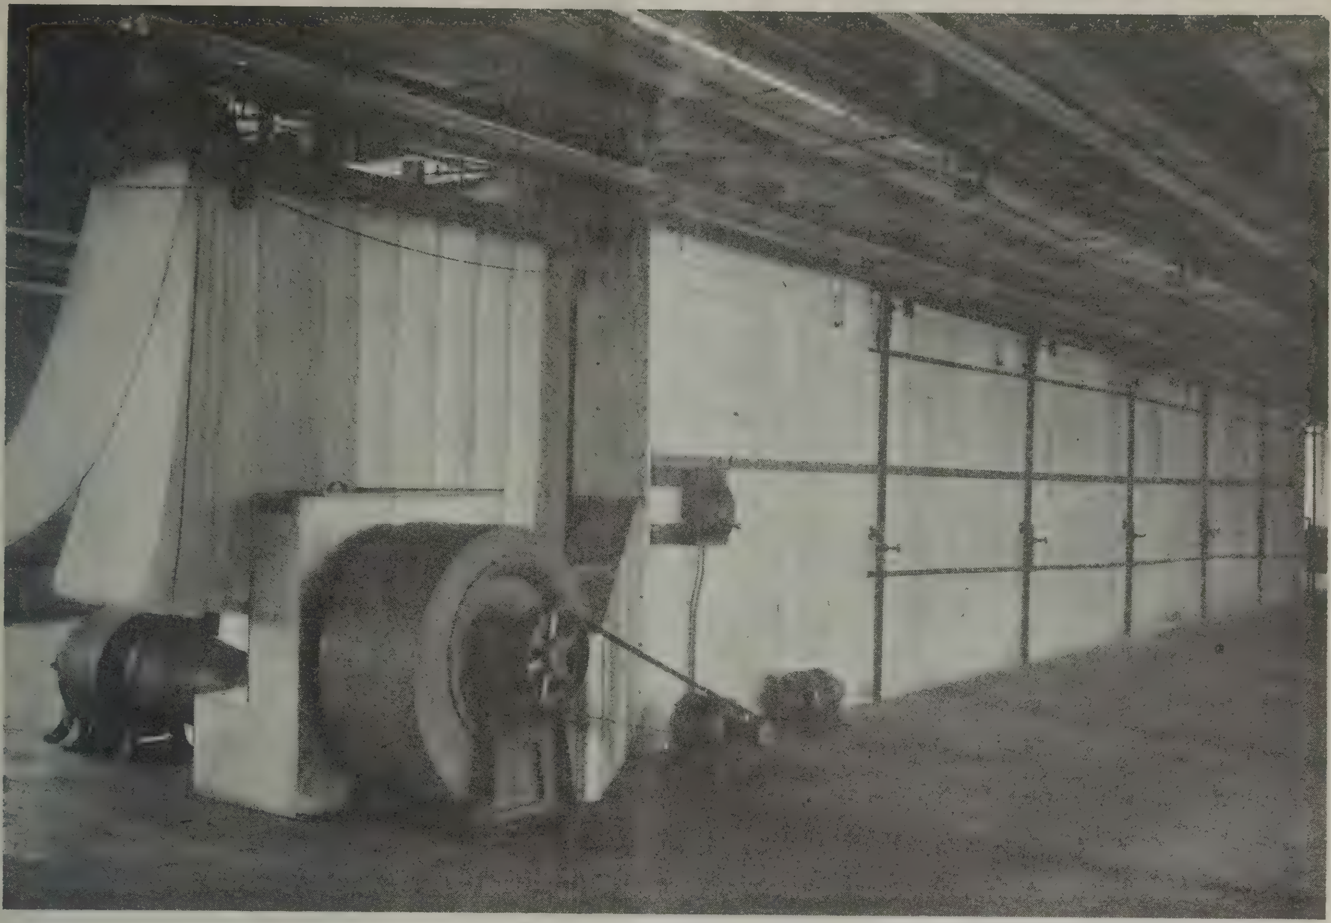
New Issue Out

The Howard Smith Paper Mills, of Montreal, are out with an issue of $1,471,000 of bonds. The issue is part of the present authorized issue of first mortgage sinking fund bonds paying 7 percent and maturing in 1941. Up to the present, 1924 earnings show a satisfactory increase over those for 1923. The mills are at present working at about 80 percent of capacity. Export business to all countries save Mexico and India shows an increase. German and Scandinavian competition is, however, especially keen. Domestic trade is satisfactory and shows an increase over 1923. Prices are holding steadily, and raw materials such as rags, etc., show a tendency to advance, which may raise the price of paper.

* * *

Gets Pulpwood Holdings

The Brompton Pulp & Paper Company, Limited, has acquired new pulpwood holdings. Under the arrangements the company will have available for use an area of approximately 45,000 acres of land comprising approximately 500,000 cords of pulpwood, 65,000,000 feet of pine lumber as well as other woods, and an up-to-date and efficient mill and plant together with contingent equipment, sidings, etc. The area has been purchased at a price that is considered exceedingly reasonable and will be paid for by an issue of $850,000 6 percent bonds of the McCrea Wilson Lumber Company. The Brompton Pulp & Paper Company will own the capital stock of the McCrea Wilson Company. The new limits, 24,000 acres of which are in Canada and 21,000 acres in the state of Maine, are adjacent to the Brompton mills which means a low transportation bill.



Type "C," 60 foot Paper Drying and Conditioning Unit, Standard for Coated paper, Sized Paper, Special Impregnated Paper, Wall Paper and for Conditioning Raw or Uncoated Stock. Also for Oxidizing Varnished and Insulating Papers.

Detection of Crime by Paper

French Paper Expert and Lawyer Treats of Paper Analysis as Applied to the Detection of Crime

IN a recent issue of PAPER an article was published under the heading "Forensic Paper Chemistry," which was erroneously credited to A. Papineau-Couture, who happened to be only the translator of the article. The article originally appeared in *La Papeterie* and was reproduced in the *Pulp and Paper Magazine;* it dealt with the detection of possible forgeries or other tampering with documents. Owing to one of those unaccountable slips in the print shop, part of another article on "Slime Formers for Pulp" was tacked on to the article. The irrelevancy of the added matter was apparent at a glance and readers could readily make the proper connection.

French Courts Depend on Paper Analysis

The subject of crime detection by the analysis of paper or documents submitted as evidence in criminal cases appears to attract much greater attention in the French courts than in our own. Monsieur Jean Lhermitte, a well known Paris paper expert and avocat or lawyer, relates in *Le Papier* one or two cases of crime detected and mysteries solved by a careful physical and chemical analysis of the paper appearing as evidence. A summary of the article is contained in a recent number of the *Paper Makers' Monthly Journal.*

Physical and Chemical Means Used

A very little thought will suggest that ordinary paper, as distinct from banknotes, even common letter paper may well be the means of confounding the holder. One can imagine that a piece of paper found at the place where the crime was committed, and a paper found at the house of a suspected person might be submitted to minute analysis for a comparison of quality, texture, fiber, color, loading and size. M. Bayle, chief of the laboratory at the Pasteur Institute has elaborated the idea of differentiating or identifying two samples by a careful physical and chemical analysis. It is not to be supposed that such analysis shall determine the life of an individual solely on the evidence of quality, but clearly the investigation must prove of great value.

Defect in Watermark Established Guilt

One case is that of the anonymous letters of Tulle. The police suspected a certain Angele Laval by reason of handwriting. The evidence was supported by comparing the paper used for the letters with writing paper found at the house of the suspected person. A defect in the watermark was identical in both cases, as shown by an enlarged photograph of the watermarks in different sheets. It was a case of assuming that two dandy rolls could hardly exist in which the same defect would occur in the same place.

The presence of a thick wire in one position, or the existence of a thin place elsewhere would easily account for a corresponding defect in the paper watermark. The same arguments would apply to the wire mark of a machine wire, the defects or peculiarities of which would impress themselves on the paper.

Micrographs of Fibers as Identification

In a similar manner the micrographs of paper fibers afford valuable evidence of difference or identity, allowing the authorities to find further proofs of complicity. The importance of this is supported by a story quoted. A crime had been committed near Lyon, a rich peasant being murdered by means of a hatchet, with which the victim's skull was broken. At the spot where the murder took place the magistrate's officer had found a piece of paper stained with blood, it having been used to clean the hatchet. Later on a hatchet stained with blood was found at the house of a neighbor, who was arrested. He protested his innocence. Further investigation showed traces of paper fiber attached to the surface of the weapon and a microscopic examination of the original piece of paper showed that while it consisted entirely of woodpulp the fibers on the hatchet were solely cotton giving the usual wine-red color when stained with solution of chloro-zinc-iodine. The true culprit was afterwards found in a hovel in Lyons, where his equivocal statements and extravagant expenditure had already created suspicion.

Fibers of Cloth Afford Evidence

The burglary of the Post Office of Vauvenargues is another case in point. A screen had been used to protect the light of an oxy-acetylene lamp used to burn open the door of the safe.

The screen, which it appeared later, belonged to the burglar, had been altered and disguised by the use of fresh material tacked on to the framework. But the original nails still retained fragments of the old material. The bulk of the latter was discovered hidden away in the house of an old servant of the accused person. A microscopic examination of the fibers, a chemical examination of the cloth sufficed to give all the necessary confirmatory evidence.

Cases of forgery, and imitation postage stamps may also be quoted as interesting examples of this kind. The examination of the paper and its constituent elements is a subject of fascinating interest.

Rubber Latex for Paper Board

Frederick Kaye, who introduced the process for making rubber-latex paper, has invented a new use for rubber latex in the manufacture of boards, leather and linoleum substitutes. The amount of latex required in making boards, etc., varied from 30 to 40 percent of rubber content (more than is used in making rubber latex paper), the quantity depending on the nature of the fiber and the purpose and quality of the final product. The increase in tensile strength was greater with low-grade materials.

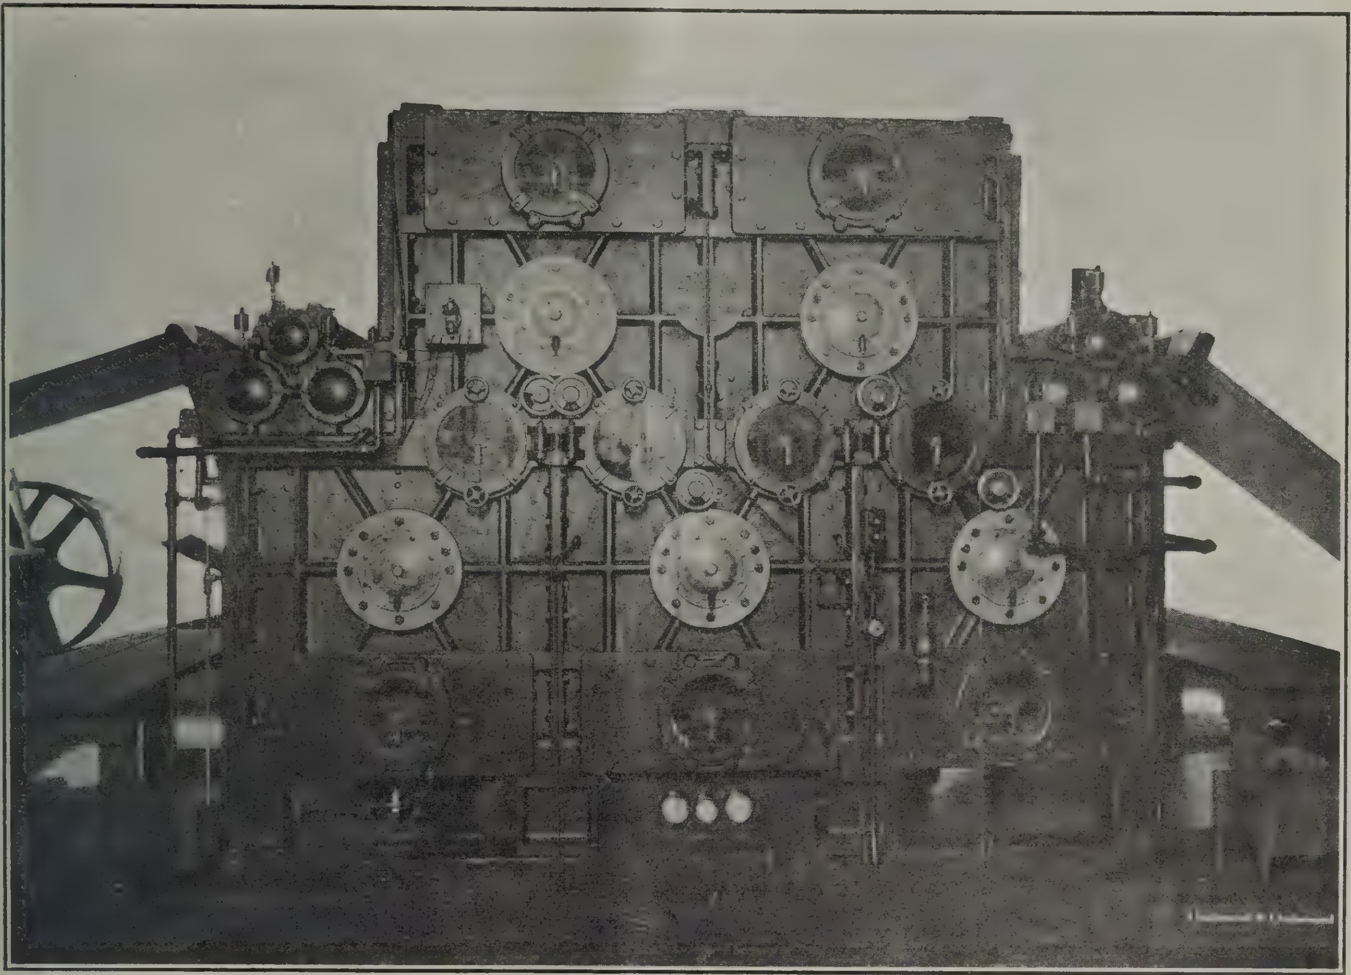
The development of the manufacture of latex boards should lead to a big range of new products made by papermaking and board machines, *e.g.,* floorcloth, leather boards, asbestos boards, mill boards and containers. Latex boards are easy to color and could be used in the electrical industry. As latex boards are well suited for embossed effects, they could find use in bookbinding, paneling, etc. The boards can, it is said, be self vulcanized during manufacture at very small cost.

* * *

Guttapercha Substitute from Paper

According to the patent specifications of a process for the manufacture of imitation guttapercha and leather issued in England to Hydroloid, Ltd., raw paper is passed through a bath of sizing material, *e.g.,* glue, casein, or albumin, of 5 to 15% concentration at 35° to 40°, and pressing between rolls during or immediately after immersion. After several hours, hardening materials, such as alum, chromium salts, or formaldehyde, are applied. The material is then softened by treatment with glycerin, or alternatively, soap or castor oil may be included in the sizing bath. The sheets are finally coated with a transparent varnish. The addition of sodium hydroxide, up to 2%, or of lactic acid up to 30% on the weight of the dry sizing material, facilitates impregnation in the sizing bath. For combining several layers of treated paper a stronger solution, *e.g.,* of 25 to 35% concentration, of the sizing material is employed.

Minton Vacuum Paper Machine Dryer



A New and Improved Method of Drying Paper

Under 28″ Vacuum **At a temperature of 100° F.**
Greatly reduced number of dryers

Some of the advantages over present system—

Steam consumption materially reduced
Low drying temperature (100° F.)
Strength and quality of paper improved
Machine room free of vapor
Reduced broke
Drying not affected by weather
Better control and more uniformity of product
Drying unit occupies less floor space
First cost no higher

This machine will be demonstrated on the 10th and 11th of April (Convention Week), or at any other time by appointment, at the plant of the Norwalk Iron Works, South Norwalk, Conn. South Norwalk is on the N. Y., N. H. & H. R. R., one hour ride from New York City. ***INQUIRIES SOLICITED***

Tests for Paper Dyes

Simple Methods for Determining Money Values in Dyes for Paper—Comparisons of Tints and How They May be Made

By LEONARD MANN

Frequently it is necessary in practical papermaking to make a quick comparative estimate of the tinting value of different dyestuffs. In the accompanying article reproduced by courtesy of the National Aniline & Chemical Company from Dyestuffs, *the author makes a number of practical suggestions which can be easily applied to obtain definite results.*

EVERY user of dyes for paper, especially aniline dyes, is frequently put to the necessity of deciding which one of two or more products offered to him for a certain shade is the best money value for his purpose. The points to be considered in such a test are primarily strength, shade, and solubility in their relation to the price asked. The actual money value of pound against pound can only be determined by means of careful tests, some of which are discussed in this article.

The degree of solubility of a dye is found more or less readily by dissolving equal quantities of the samples of dyestuffs to be compared, under the same conditions. This means that equal amounts of water of the same temperature are used, also equal quantities of acetic acid, (when used to correct hard water in connection with basic dyes) or soda ash (when the products are direct dyes). The facility with which a perfect solution is obtained or the amount of insoluble matter or residue left over, are carefully noted and compared.

By pouring the solutions so obtained on filter or tissue paper, a preliminary comparison of the shade is possible, but this should not be taken as final unless it is a case of dipping or calender staining colors. This method is more dependable than a comparison of solutions in glass beakers or graduated stand glasses only, though an approximate estimate as to the strength can be obtained by this latter method.

To arrive at the actual coloring value of dyes used in beater-dyeing, the two dye samples to be tested should be applied to the stock for which they are intended under identical conditions, and the actual mill process duplicated as closely as possible.

The most reliable way to test dyes, of course, is to make an actual mill run with each dye on an identical furnish including equal amounts of size, alum, and fillers and under the same beating and dyeing conditions. Where this method does not for some reason recommend itself as an initial test, the dyeing should be done on a small scale and if care is taken to have the above mentioned conditions as to furnish, etc., equal, thoroughly dependable results will be obtained.

For such a test, the stock is either prepared in a small experimental beater, or where such a beater is not available, stock is taken from one of the mill beaters after being beaten sufficiently to permit forming a sheet on a hand mould, but before the addition of size and alum. Such stock is then weighed out in equal quantities into several beakers, preferably of enamel ware, due precaution being taken that the amount of moisture and dry contents of each quantity of stock are equal.

Standard solutions of the dyes to be compared are then made up, and equal amounts of these solutions added to the stock in two of the prepared beakers. Size and alum are added in equal quantities to correspond with the amounts used in actual mill practice and then the contents of these two beakers are agitated either by hand or preferably by some mechanical device for an equal length of time.

Glass bottles are sometimes used in place of enameled beakers or pots, the mouth of the bottles being closed by a stopper and the agitation of the stock being done by means of vigorous shaking by hand, although mechanical devices for shaking and agitating will produce more accurate results.

After the stock in each of the beakers has been agitated for an equal and sufficient length of time a hand sheet can be formed and dried in a convenient way, either in the air or on an electric hot plate or on a paper-machine dryer. After drying, the sample sheets are compared, and if there is a noticeable difference in strength, new sheets are made of the weaker sample in the same strength as before and of the stronger sample with a reduction of the amount of color solution to approximate the weaker sample. A trustworthy basis for comparison of strength in percent is thus arrived at, and with prices known, the money value of each sample is readily determined.

* * *

To Build Addition

The Chagnon Huggard Company, Montville, Conn., manufacturers of paper tubes and cores, has completed private plans for an addition to their mill. Figures are now being obtained.

SAFETY WORK IN NEKOOSA-EDWARDS MILL

Much Interest Aroused in Contest: Old Safety Record Is Broken By Nekoosa Employees

THE Nekoosa mill is holding the lead in the safety contest which has been in progress between the Port Edwards and Nekoosa Mills of theNekoosa-Edwards Paper Company of Port Edwards, Wisconsin, since the first of the year, and a few days ago broke the Nepco record of 41 days without an accident, which was hung up at Nekoosa in 1920. The Nekoosa Mill has now gone 46 days without an accident and superintendents and men alike are confident of continuing the good record indefinitely.

Seek 25 Per Cent Cut

The Safety contest was decided by the Safety department of the Nepso mills, of which F. H. Rosebush is the head, in an effort to bring about a 25 per cent reduction in the number of accidents during 1924. There had been steady decline in accidents during the previous years, but the opinion was held that better results were possible, and the results of the safety contest thus far have confirmed this belief.

During the month of January the Nekoosa mill went through without a single accident. Port Edwards went twenty days and then had an accident, which proved to be the only one for the month.

Port Edwards had two accidents during February, while Nekoosa finished that month with only one, which occurred February 4th. Since that date there have been no accidents at the Nekoosa mill.

Men Are Interested

Much interest in the campaign is being shown by the employees at the Nekoosa Mill, and they are working to maintain a record of no accidents for as long as possible. If both mills go for any one month without an accident the safety department has guaranteed to supply candy and cigars.

Under rules of the contest an accident is counted when a man who is injured is unable to return to his regular job on his regular shift. Minor injuries count as much as a broken leg in the safety record, and men at the Nekoosa mill are not taking any time off for bruised fingers or similar hurts.

The slogan adopted for the contest is: "Educate the careless Man. If you can't educate him, eliminate him."

* * *

Out For Safety Record

The Kimberly mills of the Kimberly-Clark Company are out to win the world's safety record. To do this they will be obliged to operate until May 5 without accident. If this is done the Kimberly mills will surpass the record of the Kimberly-Clark mill at Niagara which went 97,800 man-days without an accident. The Kimberly mill already has 67,000 man-days to its credit, free from mishap.

These facts were brought out by Stanley Lowe during a safety meeting of the Yellow division when he urged employes to cultivate a safety spirit that would result in a world's record

The clubhouse was filled with employees of the papermill at the meeting, the entertainment consisting of a miniature circus with many freak performances in which the workers took part.

CONSTRUCTION NEWS

A Summary of Vital Facts Regarding Construction, Finances and Operation of Paper Mills

West Sacramento, Cal.—Officials of the United States Fiber & Products Corporation are perfecting plans for a reorganization of the company, with capital of $300,000. Plans include the remodeling and improving of the present mill, used for the manufacture of cardboard, etc., with the installation of additional equipment and a new pulp mill. J. M. Henderson, jr., and C. A. Davis heads the company.

Waterbury, Conn.—In connection with its new plant addition, to be one-story, 25x50 ft., the Waterbury Paper Box Company, Leonard street, plans for enlargements in the present works, including an additional story, 82x188 ft. Additional equipment will be installed. A general contract for the work has been awarded to the Clark Construction Company, 168 Grand street. T. B. Peck, Waterbury, is architect.

York, Pa.—The Continental Paper & Bag Mills Corporation, 16 East Fortieth street, New York, recently formed under Delaware laws, has taken title to the mill and property of the York Haven Paper Company, York Haven, and will operate the plant in the future. It is said that extensions and betterments are under consideration. The Continental company recently took over a mill of the International Paper Company, at Rumford, Me.

Cap de la Madeleine, Que.—The St. Maurice Paper Company, has started work on its proposed new plant addition, to be used primarily as a machine works. It is estimated to cost close to $450,000, including equipment. It is said that orders for necessary machinery will be placed at an early date, in addition to contracts already awarded.

Reading, Pa.—The local plant of the Doly & Scrimgeour Company, 319 River street, has been acquired at a receiver's sale by Clinton E. Wood, Philadelphia, Pa., and associates, for a consideration stated at $50,358. The new owners are said to be perfecting plans for the resumption of operations at the plant, including necessary improvements.

Harpers Ferry, W. Va.—The Harpers Ferry Paper Company, has tentative plans under way for expansion in its mills, to include the installation of equipment, and the acquisition of additional properties. A meeting of stockholders has been called on April 18, to arrange a fund of about $250,000, for the development.

Kenora, Ont.—The Backus-Brooks Company, has work in progress on the installation of machinery and operating equipment at its new local mill, to be used for the production of newsprint, and plans to have the unit ready for service at an early date. It will be developed to maximum output shortly thereafter. The company is running full at its pulp mill, and proposes to maintain at this rate for an indefinite period.

New Companies

Los Angeles, Cal.—The Schumacher Wall Board Corporation has been incorporated under Delaware laws with capital of $2,000,000, to manufacture wall board products. The company will take over and expand the organization of the same name, with plant at Fifty-eighth and San Pedro streets.

Newark, N. J.—The Paper Mills & Cord Company, Inc., has been incorporated with a capital of $50,000, to manufacture and deal in woodpulp, etc. The incorporators are H. M. Livingston, George W. R. Fallon, and Percy W. Baker, 13 River street, Newark. The last named is representative.

Central Falls, R. I.—The Alfred Frost Paper Box Company, 448 High street, has filed notice of organization to manufacture paper boxes and containers. Joseph Stenhouse and Charles L. Hawes head the company.

Wilmington, Del.—The Whikan Corporation, care of the American Guaranty & Trust Company, 1600 Delaware avenue, representative, has been incorporated with a capital of $15,000, to manufacture and deal in paper products.

New York, N. Y.—The Scandinavian Export Paper Company, has been incorporated with a capital of $30,000, to deal in paper products. The incorporators are F. Lockwood and H. Svenson. The company is represented by G. M. Spencer, 120 Broadway, N. Y.

Chicago, Ill.—Whiting & Cook, Inc., 215 West Randolph street, has been incorporated with a capital of $5,000, nominal, to manufacture and deal in paper specialties. The incorporators are A. L. Rittenberg, Abraham Greenspahn and William R. Swissler.

Pawtucket, R. I.—The Service Paper Company, 21 High street, has filed notice of organization to deal in paper products. The company is headed by Frank E. Reardon, 217 East avenue.

New York, N. Y.—The Standard Paper Box Machinery Company, has been incorporated with a capital of $15,000, to manufacture equipment for the production of paper boxes and containers. The incorporators are L. and F. Schulman, and J. Adams. The company is represented by Abraham Rosenbluth, 233 Broadway, New York.

New York, N. Y.—John J. Eschenbrenner, Inc., has been incorporated with a capital of $10,000, to manufacture and deal in paper products. The incorporators are J. J. and N. J. Eschenbrenner. The company is represented by Brennan, Flaman & Simpson, 44 Court street, Brooklyn.

St. Paul, Minn.—The B-K Mfg. Company, has been incorporated with a capital of $50,000, to manufacture paper bag specialties, etc. The incorporators are L. A. Bonue, Gaylord, Minn.; and J. M. Korta, St. Paul.

New York, N. Y.—The Locktite Fibre Boxes, Ltd., has been incorporated with a capital of $25,000, to manufacture boxes, containers, etc. The incorporators are A. C. Kahn and W. J. Fallon. The company is represented by Bandler, Haas & Collins, 2 Rector street, New York.

Buffalo, N. Y.—Harris Smith, Inc., has been incorporated with a capital of $10,000, to manufacture and deal in paper products. The incorporators are P. and R. Harris, and C. A. Smith. The company is represented by M. Weimar, attorney, Buffalo.

Financial

Wilmington, Del.—The Wilmington Paper Box Company, Market and D streets, has filed notice of increase in capital from $20,000 to $100,000, for general expansion.

New York, N. Y.—The Eastern Folding Box Company, 405 East Fourth street, has arranged for an increase in capital from $20,000 to $30,000, for increased operations.

Windsor, Conn.—The Rainbow Paper Corporation has filed schedules in bankruptcy, showing liabilities of $138,332, and assets of $10,535. A meeting of creditors was held at Hartford, Conn., on March 25.

New York, N. Y.—The Gotham Tissue Corporation, 925 Courtlandt avenue, has filed notice of increase in capital to $30,000.

* * *

New Issue Out

The St. Lawrence Paper Mills, Limited, are out with an issue of $2,500,000 of 20-year 6½ per cent sinking fund gold bonds. The company's assets are valued at $5,381,467, of which $1,234,656 is represented by property, $3,404,965 by a newsprint mill, less depreciation, and $741,846 net working capital. The company has placed in operation a modern newsprint mill of 150 tons daily capacity, and has acquired sufficient timber liimts to assure a supply of wood for forty years, and in addition has entered into a contract with a responsible firm of pulpwood producers for a further twenty years' supply. This means that the company will have a sixty years' supply of wood ahead. The newsprint mill at Three Rivers has two paper machines in operation with a daily production capacity of 150 tons, or at the rate of 45,000 tons a year. Some see in this financing a renewal of the efforts to bring about a merger of the St. Lawrence and St. Maurice companies.

The economic problem of securing an adequate supply of paper

THE book is of special interest to everyone connected with the pulp and paper industry and equally so to all users of print paper. It points out clearly what must be done to develop sufficiently our supply of pulpwoods. It shows the steps necessary in forest conservation and discusses the subject from the practical viewpoint of industrial needs.

Pulpwood and Wood Pulp in North America

By Royal S. Kellogg

Author of *Lumber and Its Uses, The Cost of Growing Timber, The Timber Supply of the United States, etc.*

270 pages, 6x9, 87 illustrations, $4.00 (*English price 20s.*) *net, postpaid*

The book describes the pulpwood industry, the processes of making paper pulp from wood, the timber supply of North America, the need for increased timber production and the future possibilities of the pulp and paper industry. Detailed statistics of production and consumption since the establishment of the industry are given in the appendix and shown in the text by means of graphic charts of unusual effectiveness. The book also carries many illustrations typical of mill operations and forest scenes.

Do You Know

That 100 million cords of pulpwood have gone into paper in the United States and 30 million cords in Canada?

That paper-making is a billion-and-a-half-dollar industry in North America?

That a permanently self-contained operation for the manufacture of 100 tons of news print paper daily may require the equivalent of an investment of $10,000,000?

That the United States and Canada produce and use as much paper as all the rest of the world combined?

That the per capita consumption of paper in the United States is 150 lb. yearly?

How much pulp may be made from a cord of wood?

How much pulpwood and wood pulp has been exported from Canada?

How much pulpwood and wood pulp has been imported into the United States?

What are the pulping properties of 70 species of American woods?

What are Forest Regions of North America?

How much and what kinds of timber there are yet left in the various regions of the United States and Canada?

How much forest land in North America is publicly owned and how much privately?

What regulations apply to timber cutting in the public forests?

What are the essentials of a forest "Working Plan"?

That forestry is the application of definite scientific principles to the growing and using of timber crops?

What it costs to grow timber?

Who is responsible for the maintenance of the timber supply of the United States and Canada?

What are the essentials of a National Forestry policy?

That without forestry there is no adequate, permanent supply of paper and other wood products in America?

That there is no sense in delaying the effort to maintain the American timber supply on the false assumption that we can turn to any other part of the world for any considerable part of the wood products essential to our well being?

MARINETTE MILL NOW PRODUCING 100 TONS OF PAPER EACH DAY

A. B. Hansen, Executive of Company, Gives Interesting Address On Production of Plant

THE Marinette and Menominee Paper Company is now producing 100 tons of paper a day, it was brought out by A. B. Hansen, an executive of the company speaking before the last meeting of the Rotary club of Marinette on "The Manufacture of Pulp and Paper at the Marinette and Menominee Paper Company." It was an illuminating and exhaustive discussion of these mill's activities, and while much of it had to do with the routine operation, Mr. Hansen brought out some facts of general interest to the trade.

The company is now manufacturing, according to Mr. Hansen, probably twenty-five or thirty grades of paper of many different colors and weights. There are only three different types of finish produced at Marinette, however. One is the dry finish, one is machine glazed, and the other is water finished.

It was announced by Mr. Hansen that the company had just completed drilling a well 800 feet deep in order to get good cold water for the purpose of getting a higher absorption of the sulphur dioxide used in the manufacture of sulphite pulp.

The Marinette and Menominee mills use nothing but wood, most of which comes from northern Wisconsin and upper Michigan. A small amount of spruce from Canada also is used. The Continental, of which the M. and M. mills are a part, owns 1,400 square miles of timber lands in Canada, Mr. Hansen said. Both chemical and mechanical pulp are made by the mills.

The Marinette and Menominee Paper Company was organized in 1882. At that time the property consisted of a small pulp mill in Menominee on the site now occupied by the Menominee mill. The new company immediately proceeded to build paper mills on both sides of the river. This was in 1883. The next development was made on the Wisconsin side of the river at what is known as Park Mills. This development was in 1891. It consisted of the erection of a ground wood pulp mill and an addition to the paper mill. In 1894 a sulphite pulp mill was added to the Park Mills plant. Up to the latter part of 1919 the majority of stock in the mills was owned by local interests. These men sold their stock interest to the Continental Paper and Bag Mills of New York City and that company assumed control of the business on January 2, 1920. The new owners immediately began to rebuild and improve the plants.

The Continental is the largest producer of wrapping paper and paper bags in the world, turns out each day the equivalent of five carloads of finished paper, 55 tons of sulphite pulp and 35 tons of ground wood. More than 500 men are now employed at the Marinette and Menominee mills.

Superintendents of Three States To Meet

The committee in charge of the convention of the Northwest Division of the Pulp and Paper Mill Superintendents' Association to be held in Marinette, Wis., May 2-3, 1924, report satisfactory progress on program and other arrangements to make this gathering a memorable one in every respect.

There will be papers on every subject of importance now up before the industry and they are to be of such nature that the discussions brought out will be of great value to all the membership.

The paper to be prepared and read by Joseph H. Slater on the manufacture of groundwood will, in itself, be of enough value and importance to Wisconsin pulp mill men to send all representatives, hundreds of mills to get the benefit of his long experience and successful operation of such plants.

L. E. Smith, of Nekoosa-Edwards Paper Company, is chairman of the Northwest Superintendents' Association and A. G. Stone, of Marinette & Menominee Paper Company of Marinette, and Paul Smith, of Combined Locks Paper Company, Combined Locks, are vice-chairmen.

* * *

Monehan Resigns

Frank Monehan, who went to Kalamazoo from Watertown, N. Y., to accept the general superintendency of the new mill at the Kalamazoo Vegetable Parchment Company's plant, has resigned. His successor has not yet been appointed.

Industrial Changes in Ohio

First changes in the lineup of Miami Valley paper industries in several months occurred this week in Middletown and Miamisburg.

The Lawrence Bag Company, of Miamisburg, has purchased the plant of the defunct Miami Cycle Company in Middletown for $40,000 and will move its equipment there in the near future. The Lawrence Bag Company is controlled by the Raymond Bag Company of Middletown, and has been employing about thirty men in the Miamisburg plant.

Shortly after this deal was closed came the announcement that the Sabin Robbins Paper Company will move its warehouses from Middletown to Cincinnati, disposing of its present holdings on Marietta Avenue in Middletown.

A survey has shown that paper mills along the Miami River in Dayton, Miamisburg, Franklin and Middletown escaped damage during the recent flood season. High water forced the temporary suspension of two Miamisburg industries but loss to the plant and equipment was small.

Luck may live with you for years or it may desert you today. Don't count on it.

LIME SLUDGE DONATED BY MILLS TO FARMERS

At Nekoosa Mill Arrangements Have Much Awaiting Wood County Farmers

LIME Sludge in large quantities is now available free of charge to the farmers of Wood and neighboring counties at the Nekoosa mill of the Nekoosa-Edwards Paper Company, it has been announced, and arrangements have been made with the Company to have the material made available.

A conveyor to load the lime sludge as it comes from the mills onto freight cars has been installed and a large pile of the material has already been dumped at the north end of the wood yard, where the farmers are at liberty to drive in and help themselves. No charge is made by the company to those who load and haul the material for their own use. About 20 tons per day of the lime in dry form is used at the Nekoosa mill.

The county agent visited the Nekoosa mill and examined the sludge. He says it is highly satisfactory for agricultural purposes in spite of the fact that it is dam and praised the Nekoosa-Edwards Company for its cooperation in going to considerable trouble and expense to make the material available.

At the Stevens Point plant of the Stevens Point Pulp and Paper Company there is also a large amount of lime sludge available for the farmers. As at the Nepco mills it is understood that there is no charge for this lime, and that the lime is distributed over a considerable area of that Company's land piled three or four feet deep, the farmers drive in and load this material, taking it to nearby farms.

At the plant of the Wausau Sulphate Fibre Company there is also a large quantity of this material on hand. This Company has, however, had conveyors installed for some time and considerable quantities of this have been shipped by carload to different parts of Wisconsin. No charge is made at this company for those who come and load their own lime, but a charge of $10.00 per ton is made to those who have a car loaded.

About three tons per acre of the sludge should be used to secure the best results, according to the county agent. He points out that quicker results are secured with the mill sludge than with ground limestone. Lime in the soil is important not only to counteract acidity but to supply plant food, and is particularly valuable in the growing of legume crops such as soy beans, clover and alfalfa.

There are many hundreds of sulphate mills throughout the United States and this may be a way that many of those who are now dumping this valuable material into the river may have a way of disposing of same and at the same time give valuable aid to the farmer.

Bell Resigns

Charles Bell, general manager of the Eddy Paper Corporation, has resigned, and will leave at once for Pinehurst, N. C., where he will try to regain his health.

As a token of their esteem, his associates and employees presented him with a gold watch. He was granted a leave of absence a few months ago, and later returned greatly improved in health, but was unable to continue.

News From New England

Names Receiver

Acting under authority of a Deed of Trust given by the Fibreboard Company, securing an issue of its second mortgage notes which are in default, the Beacon Trust Company applied to the Court for a Receiver to hold all the property covered by the second mortgage. The Court has appointed George W. Perry, 150 Congress Street, Boston, Massachusetts, Receiver, for the purpose of conserving all the assets covered by the second mortgage.

The company is endeavoring to make some arrangement with the Receiver in order that the business may be continued and a reorganization of some kind effected. This can only be done with the co-operation of all the creditors. The following committee, representing over 80% of the unsecured claims, have agreed to act:

Charles E. Stanwood, Chairman
Galt F. Parsons, Secretary
Alfred N. Miner, Jr.

The committee will make an effort either to reorganize the old company or to form a new company, so that the business can be continued with the hopes of ultimately working the proposition out in a manner satisfactory to all creditors. It is apparent that if the business stops there will be nothing available for the unsecured creditors.

* * *

Brooks with the I. P. Co.

William S. Brooks, chief papermaker with the American Writing Paper Company, Holyoke, Mass., until he resigned a short time ago, has taken up his new duties with the International Paper Company, Niagara Falls, New York.

* * *

Gummed Paper Activity

The McLaurin-Jones Company, Brookfield, Mass., makers of gummed papers, has started operating their plant on a double shift. A large increase in the order balance during the past month has made the change imperative.

Ready for Spring Log Drive

The Bellows Falls Boom Company, Bellows Falls, Vt., has completed repair work on the piers and booms along the Connecticut River, in anticipation of the early spring log drive, which starts at once. The largest amount of timber in years has been rolled into the White River for the first leg of its journey to Bellows Falls, where it will be made into paper and pulp. It is expected this year's drive will reach 15,000,000 feet of timber.

* * *

Box Company Enlarges Plant

The permit has been issued for the additions to the plant of the Waterbury Paper Box Company, Leonard Street, Waterbury, Conn. The completed plans call for the raising of the present factory building and constructing a new first story, 82 x 187 feet. There will be a new addition 25 x 50 feet, of brick. The general contract has been awarded to the Clark Construction Company, 168 Grand Street, Waterbury. Theodore B. Peck is the architect.

* * *

Fire Destroys Box Plant

The S. G. Redshaw Paper Box Company, Ansonia, Conn., was practically destroyed by fire March 28. Mr. Redshaw stated the loss would be about $30,000, which amount is partly covered by insurance, and further stated the plant would be rebuilt at once. From the start there was little hope of saving the frame constructed factory and efforts were devoted in preventing a spread of the flames to nearby buildings.

* * *

Strikers Return to Work

At Humber Valley, near St. Johns, N. F., 1,200 workers employed in constructing a large paper mill returned to work, when they agreed to accept the mediation of Premier Warren. A strike was declared for more wages and better working conditions.

Mr. Frost Is Now Sales Manager

The National Paper Products Company, Carthage Division, Carthage, N. Y., announces the promotion of John A. Frost, who has been Traffic Manager of the company, to the position of Sales Manager, succeeding J. J. C. Downey, who has resigned.

* * *

Resigns Position

Eugene J. Sullivan, who for 40 years has been a prominent figure in the paper industry of the country, and for the past 12 years a superintendent of Maine paper mills, has resigned his position with the Orono Pulp & Paper Company, Bangor, Me.

* * *

Change of Address

Tileston & Hollingsworth Company, formerly at 49 Federal Street, Boston, Mass., has taken the sixth floor of the building at 211 Congress Street. The company is one of the oldest paper manufacturers in the country, having started in business more than 100 years ago.

* * *

Annual Balance Sheet

The annual balance sheet of the American Reinforced Paper Co., of Attleboro, Mass., shows a total of $157,484 of which $80,247 is represented by machinery, $18,782 by merchandise, $2,016 by cash, $13,026 accounts receivable, $41,392 license account. The company has outstanding capital of $89,000.

Waste in the Pulp and Paper Industry

Wanted: A Waste Expert

By B. T. McBAIN

FOR three years now I have been writing stories about Waste in the Pulp and Paper Industry, and I have been receiving letters from all over the country asking about the various points brought up. Some have suggested that the matter was of enough importance for a man like myself to make a Specialty of Waste, open an office and aid the various mills of the country to get their plants on to an efficient basis. This would be nice if I were so inclined, if enough clients would apply, if I liked to travel all over the country and did not like home life, and to be known as "Waste Expert" would be interesting to say the least, but what is an expert but, to us the language of the street, a regular guy away from home? It does not take an expert to find waste. It is on the surface. It is everywhere in many plants and somewhere in every plant.

Every time I go around my own bailiwick I see waste and make a fuss about it, to be sure, but after three years of effort, I do not find that I am much nearer correcting the faults of my brother papermakers, for they are as many evidently as the sands of the seashore, and no sooner is one corrected than another crops up.

To be sure I could suggest to those in charge of most any mill means of correction of various evils, but my experience proves it is necessary after the Doctor has prescribed, in most cases at least, to have a nurse continuously to see that the medicine is taken as prescribed.

Waste is expensive, waste is causing many mills to be in the red many times when they might show a profit; waste is worse than that; waste is a crime. Anyone knowingly wasting the property of his employer with knowledge of how to prevent it, is the same as taking the value of that waste in gold out of his employer's cash box, for waste costs money, much more money very often than they pay to many doctors and nurses to prescribe and assure those paying the bill that the medicine has been taken.

Wanted—A Waste Expert.

Paper and Board

New York, April 8—Most of the paper mill men in New York attending the convention of the American Paper and Pulp Association report rather optimistically on the market situation in the various parts of the county. It is true that few mills have business enough to warrant maximum production, but a great majority of paper manufactories are managing to operate at a fair rate of capacity, and mill executives in general assert that demand for most kinds of paper is gradually expanding.

In the New York market, business has been somewhat slowed down by the convention. This is a customary occurrence since jobbers, dealers, salesmen and others connected with the paper trade are devoting a good deal of their time and much of their attention to the convention and to the numerous meetings on the convention program. There is therefore less drumming up of business, and the market momentarily is left very much in the hands of consumers, who are coming into evidence as their requirements arise and cause them to enter the market to augment their supplies.

The movement of paper in the local trade is quite routine in character. There has been little or no change in the market layout in the last few days. Buyers are operating on a fair scale yet there is little disposition shown to order other than immediately needed amounts of paper. Jobbers are still given to complain of the rather small volume of individual orders though they admit that in the aggregate business is not so poor, and that there is sufficient activity in the market to keep them well engaged.

This is the season when newsprint consumption is close to the maximum. In fact, the probabilities are more print paper is being used at this time than during any other period of the year. Publishers are constantly adding pages to their issues to carry the additional advertisements apropos of the pre-Easter shopping season. Newspapers in New York are printing larger issues than in some months, certainly larger than at any time since the last pre-Christmas retailing period. Furthermore, circulation of daily newspapers in New York is growing. As an illustration, the largest circulated afternoon paper in this city stated in its semi-annual Government report on April 3 that its circulation during the six months ended April 1 averaged 641,192 copies daily, showing a net gain of 39,355 copies per day over the preceding six months, and that the average

McMahon Patent Friction Clutches

Our Style B patent friction clutch has been adopted as standard by many of the paper and pulp mills, and many of the mills have equipped their old machines with our clutches.

Specify McMahon "Style B" Friction Clutches

When ordering new machinery and provide against future clutch troubles, loss of production, and subsequent expensive changes. We guarantee our clutches to give satisfaction on calender and dryer drives of fast running machines and all other places.

net paid circulation per day for the month of March, 1924, was 688,107 copies, showing a further increase.

Under such circumstances, newsprint demand is active. Publishers are frequently placing orders for extra tonnage, and transient buyers are increasing the volume of their buying. Prices are very firm, and it is said transient buyers are finding it necessary to pay premiums for prompt deliveries, reflecting the sold up position of mills.

Book paper is in steadily increasing demand, and prices exhibit a stiffening tendency. Fine papers are easily holding their own in price, while manufacturers are revising quotations on some lines upward, due in large part to the higher cost of new material, notably rag stock. There is a better movement of course papers. Kraft wrappings are finding a broader outlet among direct consumers, with converters also buying in a steady manner. Tissue also is fairly active, the market for fine tissue showing considerable improvement over that of a few weeks ago.

Box board prices are hardening. In fact, some manufacturers have advanced quotations on chip and news board, mills in the East generally quoting $42.50 to $45 a ton f. o. b. New York on plain chip and $45 to $50 on news board. An advance of $2.50 a ton on straw board to $57.50 per ton New York has been put into effect. Business in boards is none too brisk but there is nevertheless a fairly consistent demand of moderately broad dimensions.

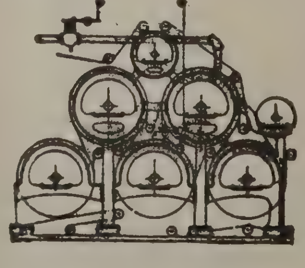
The Pickles Drying Regulator
Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to


W. F. PICKLES - Buckland, Conn.

Mechanical Pulp

There is not much change in the mechanical pulp market. In some quarters a tendency is noted to ask slightly higher prices, which sellers contend are warranted by the fairly large movement of supplies into consuming channels, yet it is apparent there is ample pulp to go around and buyers seem to be filling their wants at previous prices. Domestic producers quote around $33 or $34 a ton f. o. b. grinding mills for prime spruce groundwood for prompt shipment, with prices differing in accordance with the freight rate from pulp to consuming plants. Imported ground wood is quoted at approximately the same prices ex dock New York as domestic but sales at lower levels are frequently reported. This is the time of the year when grinding is near to a maximum, and therefore, in spite of the fairly good demand, prices are given little opportunity to strengthen because supplies are sufficient to cover requirements.

Foreign and Domestic Chemical Pulp

Not much change is to be noted in chemical pulp prices, but most reports tell of buyers manifesting increased interest and of business undergoing some expansion. It is stated that buying of foreign sulphite and kraft for forward shipment from abroad has been of rather heavy volume recently, and that this has further strengthened the statistical position of the market in Scandinavia, where manufacturers are holding pretty firmly to certain prices and are not hesitating to refuse to sell on counter offers below their ideas of ruling values.

Foreign unbleached sulphite of No. 1 grade is quoted from 2.50 cents to 2.75 cents, and foreign No. 1 bleached sulphite at from 3.75 cents upward ex dock New York. Swedish kraft is steady at 2.50 cents, with some sales a little above this price reported, and foreign easy bleaching sulphite is quoted 2.85 to 3 cents on the dock at New York. Domestic pulps display a steadier price tone and are reported meeting with at least a little better demand. Quotations ex dock New York and f. o. b. pulp mills are:

Sulphite foreign—				Sulphite, domestic—			
Bleached No. 1	3.75	@	4.25	Easy Bleaching	3.00	@	3.25

Unbleached No. 1 ..	2.60	@	3.00				
grade	2.50	@	2.75				

Domestic Rags

Demand for papermaking rags is somewhat irregular. Certain descriptions are wanted in a steady way and in fairly large amounts whereas other grades are more or less neglected by buyers. New cuttings of most kinds are moving to mills freely. No. 1 white shirt cuttings are quoted at 14 cents a pound and higher f. o. b. New York, and appear to be easily fetching this price. Fancy shirt cuttings are quoted at 7 to 7.25 cents New York, unbleached muslins at 12 cents, blue overall cuttings at 9 cents, light silesias at 9 cents, and washables at 5.75 cents. On the other hand, some of the grades of old rags are in less demand. Roofing stock is moving to certain mills at prices ranging around 2.30 cents a pound f. o. b. New York for No. 1 grade, and 2.15 cents for No. 2 stock, but there is not the concerted demand for this class of rags that prevailed a short while ago. Old blues are steady in price, while white rags are quoted at unchanged levels with some of the finer packings tending to advance. Quotations f. o. b. New York are as follows:

New Shirt Cuttings,				Overall Cuttings, Blue	9.00	@	9.25
No. 1	14.00	@	14.50	Washables	5.50	@	5.75

Light Silesias	9.00	@	9.25	Roofing Rags, No. 1 ..	2.25	@	2.35
Black Silesias	5.50	@	5.75	Roofing Rags, No. 2 ..	2.15	@	2.25

Imported Rags

There has been a slowing down of demand for foreign rags. Particularly are consumers showing less interest in the low grades, such as are used by roofing paper mills, and prices of dark colored cottons have dropped to 2 cents a pound ex dock New York. Old blue cottons display an easy tendency. Linen rags are relatively quiet and rather uncertain in price. Ex dock New York quotations are:

Lins., White, No. 1 ..	15.00	@	16.00	German Linen, blue ...	5.00	@	5.25
Ger. Blue Cottons	3.75	@	4.00	German Linen, grey ...	6.50	@	7.00

New Unbleached	10.50	@	11.00	Dk. Colored Cottons ..	2.00	@	2.15

Bagging, Rope, Etc.

Demand for old rope continues fairly good and prices of this article are firm. There is, however, some disparity in the quotations named, which is probably due to differences in quality of the material concerned. Domestic manila rope is reported bringing 7 cents and higher f. o. b. New York in sales to paper mills, and foreign rope from 6.50 to 7 cents ex dock at this port. There is not much activity in bagging and prices are easy. No. 1 scrap is quoted at 1.40 cents a pound New York, roofing bagging at 1.15 cents, and No. 1 domestic gunny at 1.50 to 1.60 cents. F. o. b. New York quotations follow:

Gunny No. 1	1.50	@	1.60	For. Manila Rope	6.50	@	7.00
Foreign	1.40	@	1.50	Domestic Rope	6.75	@	7.25

Roofing Bagging	1.15	@	1.25	Scrap Bagging, No. 1 .	1.40	@	1.50
Wool Tares, heavy	1.50	@	1.60				

Old Paper

The old paper market is still in the doldrums. There is little demand for any grade that can be called important, and prices of most classes of waste have recorded a further decline. In fact, the price tone is exceedingly weak notwithstanding the contention of dealers that available supplies are low, and that collections have been appreciably curtailed by the low prices prevailing. Shavings are quoted at 3.75 cents a pound f. o. b. New York for No. 1 hard white, and 3 cents for No. 1 soft white, and it is probable purchases have been made at less than these rates. Old magazines are especially easy, and are quoted at 1.25 cents a pound New York for No. 1 flat magazines and 1.10 cents for No. 1 crumpled stock. Folded newspapers are selling at 75 cents a hundred pounds New York, and No. 1 mixed papers at 60 cents. Old kraft is relatively steady at 2.10 cents a pound New York for No. 1 packing. Prices f. o. b. New York follow:

No. 1 Hard White Shavings	3.65	@	3.85	Ledger Stock	1.65	@	1.80
				Kraft, No. 1	2.00	@	2.15

Twines

Twines are enjoying a routine demand only, with consumers seemingly interested merely in covering their immediate needs. At the same time quoted prices are maintained but this seems due more to the strong position of raw material than to any factor on the selling side of the market. Quotations are as follows:

Sisal Hay, pure	14.25	@	15.25
Manila Hay, pure	16.25	@	17.25

No. 7	13.50	@	

Chemicals

A sagging of quotations on casein has brought market levels on this commodity down to between 11 and 12 cents a pound, duty paid on the foreign product. On the other hand, bleaching powder is firmer in price at 2.10 to 2.25 cents a pound in domestic drums. Caustic soda is quotably steady, as is soda ash.

17 PER CENT INCREASE IN JANUARY PRODUCTION

Identical Mill Reports Show Good Increase Over Previous Month

PRODUCTION of paper by identical mills reporting to the American Paper and Pulp Association and cooperating organizations showed an increase of 17 per cent in January from the December production, according to the monthly statistical summary of the paper and pulp industry.

The tonnage summary is prepared by the American Paper and Pulp Association with the cooperation of the Binders Board Manufacturers Association, News Print Service Bureau, Tissue Paper Manufacturers Association, Wrapping Paper Manufacturers Service Bureau and Writing Paper Manufacturers Association. The figures for January follow:

Grade	Number of Mills	Production Net Tons	Shipments Net Tons	Stocks on Hand, End of Month Net Tons
Newsprint	67	128,772	123,253	28,417
Book†	35	49,972	49,473	24,855
Paperboard	112	111,213	109,676	34,736
Wrapping	90	51,522	48,817	60,917
Bag	26	9,747	10,259	6,191
Fine	84	25,100	25,482	40,067
Tissue	44	9,567	9,668	7,240
Hanging	10	4,113	4,426	1,995
Felts	17	13,048	12,479	2,633
Other Grades	59	16,561	16,245	17,620
Total—All Grades		419,615	409,778	224,631

†Preliminary

The statistical table below gives the number of mills reporting to the American Paper and Pulp Association and the U. S. Pulp Producers Association, and the data as to production of the various grades of pulp in January.

Grade	Number of Mills	Production Net Tons	Shipments Net Tons	Stocks on Hand, End of Month Net Tons
Ground Wood Pulp	99	116,677	91,615	81,987
Sulphite, New Grade	39	48,922	45,717	17,739
Sulphite, Bleached	19	20,610	17,917	4,022
Sulphite, Easy Bleaching	7	6,086	4,542	1,222
Sulphite, Mitscherlich	6	6,139	6,132	1,050
Sulphate Pulp	12	14,502	12,509	8,082
Soda Pulp	11	14,001	10,683	2,605
Other than Wood Pulp	2	136	.....	243
Total—All Grades		227,073	189,115	116,950

CANADIAN EXPORTS OF PULP AND PAPER, FEBRUARY, 1924

ACCORDING to the report issued by the Canadian Pulp and Paper Association the exports of pulp and paper from Canada in February were valued at $10,947,199, an increase of $47,149 over the total for January.

Comparison with the returns for February, 1923, shows a considerable increase in the value of the pulp and paper exports for last month, the value this year exceeding that for last year by $963,531.

Following are details for the various grades:

PAPER:

	February 1924		February 1923	
	Tons	**Value**	**Tons**	**Value**
Newsprint	99,621	$7,339,636	84,395	$6,360,140
Book Paper (cwts.)	1,242	7,496	3,259	20,790
Bond & Writing " .	597	6,222	755	8,080
Wrapping	1,334	190,103	1,986	286,209
All Other	—	276,968	—	354,918
		$7,940,324		$7,030,137
PULP:				
Mechanical	14,004	$ 533,217	15,464	533,455
Sulphite Bleached	14,713	1,060,777	12,526	1,105,616
Sulphite Unbleached ..	12,679	686,955	12,950	696,128
Sulphate	12,298	725,926	9,525	618,342
	53,694	$3,006,875	50,465	$2,953,541

Februayr exports of pulpwood amounted to 131,785 cords valued at $1,219,525; this is the highest figure recorded since August, 1923, and is a big increase from the 99,830 cords valued at $866,128 exported in February, 1923.

For the first two months of this year there has been a considerable increase in the value of the exports of pulp and paper over the corresponding two months of 1923, the total value for the current year being $21,847,249 compared with $20,281,921 last year, an increase of $1,565,328.

The following table gives the exports of the principal grades of pulp and paper for the first two months of 1923 and 1924:

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912, of PAPER, published weekly at East Stroudsburg, Penna., for April 1st, 1924.

State of Pennsylvania }
County of Monroe } ss.

Before me, a notary public in and for the State and county aforesaid, personally appeared Russell C. Hughes, who, having been duly sworn according to law, deposes and says that he is the Publisher of PAPER and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher, Hughes Publishing Co., Inc., East Stroudsburg, Penna.
Editor, Thomas J. Keenan, East Orange, N. J.
Managing Editor, Russell C. Hughes, East Stroudsburg, Pa.
Business Manager, Russell C. Hughes, East Stroudsburg, Pa.

2. That the owner is: (If the publication is owned by an individual, his name and address, or if owned by more than one individual the name and address of each, should be given below; if the publication is owned by a corporation the name of the corporation and the names and addresses of the stockholders owning or holding one per cent or more of the total amount of stock should be given.)

George C. Hughes, East Stroudsburg, Pa.
Russell C. Hughes, East Stroudsburg, Pa.
Carl L. Hughes, East Stroudsburg, Pa.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.) None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscibers during the six months preceding the date shown above is
(This information is required from daily publications only.)

RUSSELL C. HUGHES
Signature of Publisher.

Sworn to and subscribed before me this 29th day of March, 1924.
(Seal)

HELEN T. HUGHES.
(My commission expires March 6, 1927.)

Color Combinations for Placards and Containers

THE newspaper agitation over the color for license plates, adopted by the New York State Automobile Commissioner has served to direct attention anew to the legibility of different colors. In the matter of legibility and ability to recognize the number of the car at a considerable distance, Pennsylvania is easily first with a combination of dark blue letters on a bright yellow background, New Jersey is a close second with red on white, but New York State is out of the running altogether, there being no provision made in any color scheme known to advertising experts for white on slate, which, however artistic it may be, on purely esthetic grounds, is valueless where legibility at a distance is concerned.

The selection of colors for advertising cards and signs has been the subject of intensive study by manufacturers of colored inks, as well as by specialists in advertising. Travelers on subway, elevated and surface car lines where advertising cards are displayed have only to cast their eyes along the line of advertising placards, to appreciate what it means to use the right arrangement and combinations of colors. On some cards the eye will rest with pleasure while others will be passed over hurriedly. Some cards may arrest attention by glaring display of color, or extreme legibility of lettering and design, but it is not by chance or haphazard methods that attractiveness and attention—value in advertising cards are secured.

Colored advertisements are generally believed to be more valuable than plain effects in black and white, though some advertising specialists are of opinion that color legibility is best obtained with an area of 25 percent of white and 75 percent of black, or background of any color with white.

Many factors influence the degree of effectiveness in a car sign, placard or even carton or label; chief of these are proper combinations of colors and backgrounds, complementary to each other. In this connection it may be of service to present a tabular list of combinations of colors, in the order of their legibility for reading at a distance. The list is quoted from a book entitled, *Color and Its Applications*, by M. Luckiesh, director of the laboratory of applied sciences, National Lamp Works of General Electric Company, who is an authority on the use of light and color as aids in advertising and selling.

1. Black on yellow
2. Green on white
3. Red on white
4. Blue on white
5. White on blue
6. Black on white
7. Yellow on black
8. White on red
9. White on green
10. White on black
11. Red on yellow
12. Green on red
13. Red on green

In each case the first color is that of the printed matter and the second color that of the background. Of course, it is dangerous to draw conclusions too finely from such data when physical characteristics of the colors, such as brightness and saturation, are not available; however, the data are interesting and may serve at least to indicate the importance of color combinations. Legibility is not the same as attention-value but there is an intimate relation. The last named is of great importance in advertising by means of railroad car display cards as well as with ordinary methods of merchandising where attractiveness of container is likely to be an important factor in selling goods, cartons, for example.

DRYER FELTS
STANDARD and MULTIPLE PLY

ENGLISH WEAVE

In Two, Three, Four, Five and Six Ply, 60 inches to 176 inches in width.

BY ACTUAL TEST this felt will dry 33 per cent more paper, with ABSOLUTELY NO FELT MARKS IN THE PAPER.

TRIUNE
THREE PLY FELT for other paper

FITCHBURG DUCK MILLS
FITCHBURG - MASSACHUSETTS

ORR FELTS
and JACKETS

Lowest Cost per Ton

If you judge felt values, not only by what you put into the equipment but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged anywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

FELT & BLANKET CO.
PIQUA, OHIO

Paper Testing Methods
(1922)

A large edition of this handbook for paper mill laboratories was exhausted shortly after the type had been distributed. In view of the insistent demand the Technical Association has arranged for a republication and *Paper Testing Methods* is again available at $3 per copy.

The work covers detailed procedure for microscopical analysis, physical testing and chemical analysis of the paper with descriptions of the apparatus employed.

It is the only complete and up-to-date handbook on paper testing published in the English language.

It should be in the hands of every paper manufacturer and paper dealer as well as concerns who are large users of paper.

GRADUATE mechanical engineer, age 31, married; practical experience in newsprint and fine writings; assistant superintendent of specialty mill; at present selling; desires to give up traveling and join paper organization in production capacity. Address Box 1297, care of PAPER.

SULPHITEMAN, university graduate, with five years' experience as laborer, foreman and chemist at mills making both strong and easy bleaching pulp desires position. At present employed as chemist but desires change and prefers a position as superintendent or assistant. Address Box 1296, care of PAPER.

FOR SALE

Beaters—One N & W 48x48 rolls, 21"-6". Two iron tub rolls 52"x40".

Bed Plates—Large lot, all sizes. New.

Calenders—One 7 roll 72"; one 9 roll 72"; one 5 roll 78"; one 7 roll open side 84". One 7 roll 124".

Calender Rolls—Large assortment, all sizes; one 14x86"; one 18x84"; one 18x100" and many others.

Coaters—One 45" Waldron, double coater, and others.

Cutters—One 38" Guillotine.

Cylinder Moulds—One 36"72"; one 30"x52"; one 12"x22".

Drives—One No. 1 Reeves Class E; two No. 3 Reeves Class E, 4 to 1; one No. 3 Class E; one No. 6 Large Reeves; one No. 10 Reeves, F-3 to 1 with extra disc.

Dryers—48x116.

Exhausters—One Sturtevant.

Fans—3 Hunberry; 2 Perkins.

Jordans—One N & W Monarch, with new shell two Horne; two Emerson, large size, one base; one N & W Pony, with extra plug.

Pulleys—One 98"x34" face, double arm, modern, Iron pulleys; Cone pulleys for Marshall Drives.

Pumps—One dry suction Knowles 12x22x18; one 1000 gal. Blake Tank pump; two Lawrence Mch. Co.'s Class A 8" high duty; two 6" Emerson make; one 4" Centrifugal; one Type 4 Gould 5" triplex, self contained. Two Lawrence Machine Co.'s Class A, No. 4, double suction pump for high elevation or for low speed. Thoroughly rebuilt and ready for shipment.

Press Rolls—One pair new, one RC 18x80"; one Gun metal 18x81"; one 16x75"; one RC 15½x73½".

Rag Cutters—Two No. 2 Daniels; one Perkins.

Screens—4-8 pl. New Success.

Slitters—One 86" P & J.

Winders—One 86" P & J; one 100" P & J; one 112" M & W.

Wet Machines—One N & W with cut offs, mould 30x52"; two spare moulds.

One set Dillion Doctors for 80" calender rolls.

MILLS MACHINE COMPANY
Lawrence. Mass., U. S. A.

THE CLEARING HOUSE—Continued

MISCELLANEOUS

WANTED—A paper company to locate a large pulp and papermaking plant in North Carolina, with a million cords of pulp wood deliverable at the plant at $3.75 a cord, a saving of $20,000,000. Lands for plants, fronting deep water for deep sea loading. Millions more cords of wood available very cheap. A clear stream of fresh water free for washing pulp. Address Box 245, care of PAPER, 1478 Broadway, New York City.

REPRESENTATION is solicited of responsible mill which seeks to sell paper or pulp in this country. Considerable experience and success enjoyed in the industry. Age 34; university training and well connected. Will share expense of a trip to home office of mill interested in interview. Address Box 1289, care of PAPER.

EXPERIENCED publicity and advertising man who can make paper carry any desired message of interest to the promoter, for any legitimate business or its expansion for greater profit, is open for engagement. Address H. C. Beatty, Box 58, Wilkinsburg, Penn.

GOVERNMENT BIDS

TREASURY DEPARTMENT, Office of the Secretary, Washington, D. C., March 15, 1924. Sealed proposals will be received at this office until 11 o'clock a. m., Wednesday, April 16, 1924, from manufacturers of bond, bank-note and other fine papers for furnishing bank-note paper of the highest quality containing the distinctive feature now in use by the Department, for the printing of United States currency and public debt securities, national and Federal reserve bank-notes, Federal reserve notes, etc., for the fiscal year beginning July 1, 1924. Blank forms for submitting proposals, with specifications and further information will be furnished manufacturers who intend to bid upon application to this office, where samples of the paper required may be examined. A. W. MELLON, Secretary of the Treasury.

Treasury Department, Bureau of Engraving and Printing, Washington, D. C., April 2, 1924. Sealed proposals are invited to furnish this Bureau with Postage Stamp Paper and Internal Revenue Paper, Brass and Iron Castings, Cleaning of Windows, Purchase of Pulp, Ink Scrapings, Distinctive Paper Shredded Trimmings and Postage Stamp and Internal Revenue Paper Trimmings, during the fiscal year beginning July 1, 1924. Proposals to be received not later than 2 P. M., Monday, May 12, 1924. Blank forms with specifications for proposals for the several schedules and further information will be furnished on application to Paul E. Twyman, Assistant Director.

ANNOUNCE PROGRAM OF DAYTON MEETING

Some Splendid Speakers on List for May 22nd Meeting

THE formal opening of the convention of the American Pulp and Paper Mill Superintendents Association together with problems of training of men for work in paper mills will mark the forenoon session of the opening day of the convention, May 22, at Dayton. The work of formulating the detailed program is progressing rapidly, and the first day's program is already practically completed.

In detail the program will be as follows for the opening day:

MORNING SESSION:

9:00 A. M.—Opening Address, President Nelson R. Davis
Address of Welcome, Mayor, Frank B. Hale
Response, B. T. McBain
Apprenticeship in Papermaking, Geo. P. Hambrecht
Vocational Education, Harry Carruth
Employment Problems, Francis S. Pope
Building and Maintaining an Organization, Robert B. Wolf

12:30 P. M.—Buffet Luncheon

AFTERNOON SESSION:

1:30 P. M.—Our Part in Forest Conservation, C. L. Cecil
Papermaking Fibres, B. S. Summers
Steam & Power for Pulp & Paper Mills, H. S. Taylor
The Beater of Today, Charles Shartle
The Drying of Paper, E. P. Gleason
The Selection and Abuse of Felts, M. C. Burrell

7:00 P. M.—Banquet & Entertainment
Toastmaster, (Undecided)
Address, Sherman Rogers
Monologue, George Mann
Vaudeville Acts from Keith Theatre

A Few Stray Thoughts

THE big convention is over. The shouting has died and the captains have departed. The manufacturers of pulp and paper came to New York, basked in the sunshine of each other's smiles, commiserated each other and hoped for better times, renewed their love for each other and some mellow souls even pledged eternal fealty. They slapped each other on the back and lamented how times have changed and how it could never be again like it used to be. The socialized and fraternized, they visited and they reminisced.

Best of all they absorbed some of the collective wisdom of that group of papermakers and paper marketers. Under all the fun and happiness, there was a start of business. The various associations looked facts in the face and formed more or less nebulous plans for the future.

Everywhere there was regret at the present and immediately past conditions, but likewise the rainbow of the convention was that conditions are getting better and are expected to steadily improve. That was the hopeful thing about the entire week. There was little utter discouragement present, despite the universal agreement that conditions are not what they should be.

And therein lies encouragement.

One of the flowers that burst into bloom at the convention was the American Association of Paper Specialty Manufacturers. Its long-tailed name cloaks a wealth of possibilities for service in the trade. J. E. Willert, who has long been connected with the specialty line, is responsible for the organization. The idea has been with him for many years. In cooperation with PAPER, the American Paper and Pulp Association and a few of the big broad-minded specialty companies, the idea was put across in splendid shape. W. R. Lenderking was elected president and Mr. Willert secretary. We have no hesitancy in saying that the organization gets off to a flying start with the opportunity of doing much for the trade. PAPER wishes it success.

PAPER wants to congratulate the owners of the *Paper Trade Journal* and the *Paper Mill* for the magnificent convention numbers published. Typographically, textually and from a literary standpoint they were splendid. Wistfully, we wish for the support that makes their robustness possible. It appears the law of nature says babies must crawl first. Naturally babies appreciate a helping hand.

* * *

It will be very fortunate if there is another Paper Industries Exposition next year. It is certain, in our opinion that there will be no convention unless the exposition is held in the same building with the convention meetings.

While many companies reported a splendid list of prospects as a result of the week, there was much dissatisfaction with the attendance.

The show itself was a good one. The various lines of the industry were represented and many of the exhibits were remarkable for the thoroughness with which they were put on. Some represented long days of hard work and thought. Many were impressive and some fairly exuded education.

But the attendance was nothing to boast about. And that mere fact alone is enough to kill a thing like an exposition—especially when the lack of attendance of the manufacturers themselves is considered.

It will be regrettable to lose it and during the coming months a solution to the problem should be sought. It is the general belief that the exposition is a good thing for the industry generally and that it should not die an untimely death.

* * *

By the way, what do you think of the Convention Issue of PAPER? Our one ambition is to keep it the livest magazine in the paper industry. What is your opinion of this issue?

RUSSELL C. HUGHES,

Justifiable Pride in a Good Reputation

The reputation for staunch business integrity which the Albany Felt Company holds among those interested in the Paper and Pulp Industry is gratifying to us. Equally pleasing is the reputation for uniformly high quality which our felts and jackets enjoy among the trade.

To build up this good reputation has required years of conscientious striving. It has required an honest product, sold by honest methods. It has necessitated playing the business game according to the Golden Rule. It has called for wholehearted cooperation.

We guard jealously our reputation for fair dealing and excellence of product. We do all in our power to uphold our good name—to conduct our business according to honorable principles, so that all who deal with us, or plan to deal with us, will think well of the Albany Felt Company, its products and its business methods.

The Convention—and What

MEETING INCOMING VISITORS at hotel headquarters during Paper Week in New York is always a pleasant experience. Many mill owners and executives are unable to visit the metropolis oftener than once a year. This is especially the case with those members of the American Paper and Pulp Association and affiliated associations who travel great distances from the outlying centers of papermaking. One may maintain touch by correspondence all during the year, but this is a cold mode of contact compared with hearty handshake and greeting which follow a personal encounter.

IT was the privilege and pleasure of the editor to meet a large number of old friends and acquaintances in the paper industry from widely separated parts of the country during Paper Week. First impressions of the state of mind reflected by the leaders were somewhat disappointing, but as the week wore on much of the feeling of uncertainty was dispelled. It became apparent that the manufacturers of pulp and paper represented by membership in the American Paper and Pulp Association had not come together merely to talk of production and the probable course of prices. There were issues to be met, chief among them being the menace of foreign competition which it is alleged has grown to great proportions with a large tonnage of paper shipped to this country under false classifications.

IT is evident that a keen fight must be waged to protect our pulp and paper industry by higher tariff bars, but this being a year of presidential election and there being sharp differences of opinion among the members of the United States Tariff Commission, it is not likely that anything definite will be accomplished at this session of Congress in the way of obtaining tariff changes. The pulp producers of this country have no intention of opposing the legitimate entry of foreign pulps, but they do hope to effect some agreement with foreign manufacturers to restrict the ruinous gambling in foreign pulp which has so demoralized the market during the past year. Hand in hand with this is a movement to make the pulp industry more of a force and dominating influence throughout the entire industry. It is recognized that the situation is an extremely difficult one in view of the fact that pulp is on the free list, but a majority of the responsible firms of importers of pulp are convinced that the recent cutthroat competition has injuriously affected trade both in this country and in Scandinavia.

DURING the first day or two of contact with the leaders in the industry there was difficulty in getting them to give expression to their views concerning either the business outlook or the future of the association. A pessimistic strain prevailed and some indifference was manifested to the fortunes of the association, which was caused no doubt by the unsatisfactory state of its finances. But later on in the week the skies cleared and pessimism was replaced by optimism. A feeling of confidence as to the place of the American Paper and Pulp Association in the industry grew and developed, and this must be regarded as one of the worthwhile accomplishments of the gathering. Viewed from this and other standpoints the meeting was a success. Organization as represented by the parent association and its ten affiliated bodies is left by last week's gathering of manufacturers and mill executives in a much more secure and confidential position than ever before. As the week wore on evidences multiplied of closer coordination among the different branches and one could almost hear the steady "pump, pump" of a well oiled engine. It must have been especially gratifying to the older men in the industry to witness the enthusiasm displayed by the younger element in organizing and directing the affairs of the constituent associations. It was a matter of comment that more affiliated associations and allied groups held meetings during the convention last week than ever before, and the attendance was fully up to that of previous years, though the banquet hall on the last day of meetnig was not overcrowded, there being, indeed, some falling off in attendance as compared with previous years.

IT must be a source of great gratification to Secretary Baker and his coworkers that the association has been placed on a more substantial financial basis. It is now reported to be clear of all debt with a definite pledge of income from individual mill memberships. The program for the coming year is set forth quite fully in our report of the general meeting. It only remains to say that the administration is committed to the policy of delivering sound, progressive, association service along the lines there set forth, with expenditures kept carefully within its income.

IN speaking of association activities during Paper Week there is inevitable mention of the Paper Industries Exposition, which was so outstanding a feature of the week's activities. There was sufficient of interest to pulp and paper manufacturers at the Paper Show to attract the attention of the leaders in attendance on the convention. Of general as well as technical interest was the demonstration of handmade paper manufacture by Dard Hunter, Dard Hunter's presence was proved to be as great an attraction as the watermarked paper which he produced daily before the delighted gaze of hundreds of visitors. Mr. Hunter is an amateur of papermaking in the true sense of that term. He has a scolarly understanding of the ancient art and his watermarking processes are much admired by connoisseurs. Not far removed from the space occupied by him was an exhibit of the papermaking resources of the South which excited no little curiosity and speculation among northern mill owners who viewed the exhibits showing rates of growth of pine and other species of woods with wondering eyes for the rate of growth was greatly in excess of that reported for woods in northern latitudes. A good impression was also made by the exhibits of clays and limestones including kaolin from southern mines. The drawback to the

It Means — *by Thomas J. Keenan*

Paper Show as quite generally expressed by members of the Technical Association and the purchasing agents of firms that are large users of paper, such as tobacco manufacturers, was the small number of paper exhibits. If there had been a few more exhibits like those of the Continental Paper and Bag Mills, the Union Bag and Paper Corporation, the Hammermill Paper Company and the Westfield River Paper Company, they would have served to make the exposition less of a Machinery Show than a Paper Show.

IT may stimulate paper manufacturers to greater interest in the success of the Paper Industries Exposition to tell them that we know of one authentic instance in which a large user of paper was prepared to place $75,000 worth of business, and sent his representatives to the exposition for the purpose only to be disappointed at finding no exhibits of paper in which he was interested. There was some complaint of a falling off in attendance at the Paper Show but we do not think that the records of admissions will bear this out. The complaint was made by exhibitors and visitors who had attended the exposition the year before when it was housed in smaller quarters on the fourth floor and an impression of great crowds was helped by the constricted space. At the same time there appeared to be less disposition evinced by visitors to place orders and the record of sales effected will undoubtedly show a falling off as compared with results of the previous year.

THE Technical Association of the Pulp and Paper Industry continues to give evidence of a healthy growth and the character of work transacted at the convention evidently made a deep impression on mill owners and executives. As a result the mills are showing greater appreciation and supporting the association more actively by taking out corporate memberships, two being added during the Convention—the Continental Bag and Paper Mills and The Gardner & Harvel Paper Company. In an endeavor to visualize the accomplishments or outstanding features of the T.A.P.P.I. meeting, the casual attendant at the general sittings would be confronted with difficulties, for it was in the sectional meetings that the practical side of technical papermaking was most in evidence. There were discussions of profitable consideration for manufacturers of pulp in the separate meetings where the utilization of bark as fuel was presested together with an account of the ways of doing it, including reports on presses and furnaces. There is a possibility of manufacturers of paper who are represented by membership in the association, of knowing what it costs to dry paper irrespective of other factors. While a discussion of the paper drying code showed that it required to be developed along more correct and accurate lines the value of the code is still great. It will enable manufacturers to analyze the various factors that affect the cost of drying adversely. It was evident for example by a study of some of the tests that many times the volume of heated air for carrying off the moisture was used than actually necessary. The sectional sittings were exceptionally well attended and the discussions were noticeably active. In some instances the sittings proved so interesting that they were prolonged beyond the allotted time and the hotel employees would interrupt the proceedings to claim the room for other uses. Striking evidence of this interest in the group gatherings or sectional meetings was given at the meeting of the section on Paper Testing and Materials Testing which was held at the close of the convention when one would expect a small and listless attendance of members. It may have been that the leading lady in charge of the Materials Testing group was the drawing card, but whatever the reason, standing room only was available after the section got started on Thursday forenoon. Mis Kiely has made an unquestioned success of the work of her committee and she is entitled to considerable praise for the expeditious manner in which she conducted the proceedings. The same business-like procedure characterized most of the other sectional meetings, the sections on sulphite and soda pulps disposing of much interesting material that can be used to advantage in speeding up production and improving the quality.

IMPORTANT action was taken by the Technical Association by its decision to form local sections in selected papermaking centers, particularly where a sufficient number of the younger technical men can be brought together regularly for the discussion of problems that confront them in their daily work, and where they can get the benefit of the experience of older men in the industry. It is worthy of note that in the revision of the articles of organization provision has been made for the award of Honorable Mention, under proper certification, to inventors or discoverers of processes who may be deemed worthy of the award. If the Technical Association of the Pulp and Paper Industry had been in existence when Jordan invented his refining engine or when the decker was invented, those inventors on the mechanical side would have been distinguished in the manner that it is now proposed to single out the authors of conspicuous achievements in technical paper work.

THERE is much constructive work yet to be done by the Technical Association of the Pulp and Paper Industry and we may suggest that a closer contact might be established between the association and the various government bureaus which have relations with the industry. The Forest Products Laboratory at Madison, Wis., has always maintained the most intimate contact with the Technical Association of the Pulp and Paper Industry from the earliest days and the investigations carried on there supported to the fullest extent financially and otherwise by the leading paper manufacturing firms. There is no reason why a similar coordination of effect should not be possible with the Bureau of Standards and the Government Printing Office, who are represented in the association through the members of the Technical Staff in each instance.

The Magazine of the Paper Industry

American Paper and Pulp Association

Action Taken to Continue Import Service for Another Three Months—General Movement for Simplification of Paper Sizes Approved—Reports on Conditions in Special Papers Show that Industry Generally is in Good Condition—President Stokes is Reelected

THE annual general meeting of the American Paper and Pulp Association was held in the Astor Gallery of the Waldorf-Astoria on Thursday morning, April 10. The meeting was called to order by Henry W. Stokes, president, who read a statement of conditions in the industry, which is printed in full on another page.

Activities and Program

Norman W. Wilson, chairman of the Special Committee on Activities and Program of the American Paper and Pulp Association, submitted a report with interpellations. The committee was composed of Norman W. Wilson, Hammermill Paper Company, chairman; H. H. Ellerson, Albemarle Paper Manufacturing Company; Frank E. Taylor, Advertising Paper Mills; D. C. Everest, Marathon Paper Mills Company; C. R. Mc Millen, Union Bag and Paper Corporation.

The committee held three meetings at which there was full discussion of the present form of organization and the relation of the association to its affiliated associations. It was found that discussion of the form of organization and its relation to affiliated associations could not be separated from the question of financing the association. The recommendations of the committee accordingly cover both form of organization and methods of financing.

Form of Organization

It is recommended that there be no essential change in the form of the Association or in the relation of the association to its affiliated associations. The association can function most effectively by continuing as the federated organization of the paper industry, with other associations in the industry as affiliated associations.

To facilitate the work of the association, however, it is recommended that the present Executive Committee, which is made up of the elected officers of the association, the past presidents and the presidents of the affiliated associations, be changed to an Advisory Council, which may meet at least once each year for discussion of the work of the association for the industry.

It is recommended also that there be an Executive Committee consisting of elected officers of the association and five other executives in the industry, who shall be elected at the same time and in the same way as the president and vice-presidents of the association. The president of the association shall be chairman of the Executive Committee.

Activities of the A. P. & P. A.

It is recommended that the association continue to function as in the past, for the protection, promotion and perpetuation of the paper industry of the United States.

It is recommended that the program for the association's activities in 1924-25 feature the following:

1. Representing the Industry—Such activity is fundamental to the character of the association. It means representing the industry at Washington, at various State capitols, in papermaking States, with other industries, and before the public.

2. Statistics.—The statistical activities of the association to cover general statistics for the entire paper industry, import and export reports, and such detailed statistical reports as may be needed. The association to cooperate with affiliated associations and thus avoid duplicating the activities of those associations.

3. Tariff and Import Service.—As the association is organized to protect and promote the paper industry of the country, it must take a definite stand in tariff matters for the ultimate good of the entire industry.

Any activities which are necessitated by the tariff law or changes in it, must be carried on in such a way as to represent all groups of the industry, and for the upbuilding of the industry. Tariff service is in a sense an emergency service, which must at all times be guided by the Executive Committee of the association.

The industry is meeting very difficult competition from foreign pulp and paper. The association should continue its efforts to prevent the dumping of foreign pulp and paper on the markets of this country, and the entrance of paper wrongly classified and undervalued.

4. Emergency Service.—As the association has been able, repeatedly in the past, to meet emergency needs in the industry, so it should continue to serve the entire industry and affiliated associations in such emergency matters as tariff, coal, pulpwood, casein, etc.

5. Cost and Income Tax Service.—It is recommended that the association be more active in developing cost education throughout the industry, and that the industry itself should support the Cost Association much more efficiently than at present. The work of the Cost Association of the Paper Industry, which is a separate organization, has been carefully analyzed, and it is believed that the Cost Association is doing work of vital importance to the industry along cost lines, and particularly in service to the industry on income tax matters.

It would tend toward both efficiency and economy were the Cost Association a cost section of the American Paper and Pulp Association, so that its cost and income tax service might be given to all members. This can be done only when and if the industry provides the necessary funds. Such an amalgamation is not contemplated at the present time.

6. Legislation. — The association should continue with even greater aggressiveness its protection of the industry from harmful legislation at Washington and in state legislatures, and should use its influence in furthering helpful legislation.

7. Information. — The association must of necessity serve the industry as a source of information relative to the industry here and abroad.

The limited funds assured the association for 1924-25 makes it necessary to give up the Information Service, as it has been known during the past three years. The committee has studied the activities of the Information Service carefully, however, and believes that these activities have been of great value to the entire industry. It recommends that the association carry on limited information service as funds permit.

8. Raw Material.—The committee recommends that the association continue even more aggressively its efforts to insure the industry a permanency of raw materials, such as rags, paper stock, pulpwood, etc.

During the past three years the association has allocated certain sums of money annually for the support of the work of the Woodlands Section. Last year this amount was $3,000, which covered in part the salary of the Assistant Secretary. The proposed budget will not permit of the continued support of this work. It recommends, however, that the association continue its general work through its regular force for maintenance of a permanent supply of raw materials, and that the Woodlands Section be reorganized so as to give special association service to the manufacturers owning timberlands, logging operations, reforestation, etc.

9. Meetings and Conferences.—In addition to carrying on its general work for the industry, in arranging for conventions and meetings, the association is in a position to handle the general association and statistical work of such of its smaller affiliated associations as do not have paid secretaries, at cost to the affiliated association, thus maintaining the organizations of these associations for emergency action and unifying the general statistical activities of the industry.

10. Arbitration.—It is recommended that the association extend its service in arbitrating difficulties between the buyer and the seller, particularly for mills in the unclassified division of the association, or for members of those affiliated associations which do not give direct arbitration service. The association should not extend this service into groups where the service is already under way, unless specifically requested to do so.

NORMAN W. WILSON
Vice President American Paper & Pulp Association

Financing the Association

The American Paper and Pulp Association is a busniess organization, in existence to serve the paper industry in a practical businesslike way. The committee believes that as the industry learns more of the character of service given by the association, it will finance the association so as to adequately meet the needs of the industry.

With an assured and known income which can be made the basis of annual budgets, the association can give more effective service to the industry than has been possible in the past where income has been irregular and uncertain.

It is recommended that the association continue as a federated organization with affiliated associations continuing as organization members on a nominal membership fee of from $100 to $300 per year. The committee believes that such an arrangement will not change in any way the present harmonious relations which the association has with its affiliated associations.

It is also recommended that the association continue the plan inaugurated this year of going directly to the mills, both to those members of its affiliated associations and to its own individual unclassified members, for annual membership pledges, and that, based upon the pledged amount, the Executive Committee fix the budget for the following year at its last meeting in any fiscal year, prior to the year during which the budget will be effective.

Finally, it is recommended that the Secretary-Treasurer submit monthly full statements as to the financial condition and the activities of the association to members of the Executive Committee.

On motion, the report as presented by Chairman Wilson was adapted by unanimous vote.

Financial Difficulties

President Stokes reviewed the difficulties which had confronted the association throughout the year on account of scarcity of funds to meet the expense of an ambitious program of activities. Early last December the treasury of the association was faced with a deficit of $15,000 and an appeal was sent out by a special committee for $29,000 to carry on the work of the association till the close of the association year. The response was gratifying, some $25,000 having been contributed by 114 different companies. On March 31, the books showed a deficit of $1,400, but this had since been cleared up by receipts from banquet registration fees and the association began its fiscal year on April 1, free from debt.

Acknowledgments

President Stokes closed a well worded and impressive statement with an expression of thanks to the members of the executive committee and the special committees and he made special mention of the assistance in the work of his office which he had received from Emmet H. Naylor, secretary of the Writing Paper Manufacturers' Association, and A. J. Stewartson, secretary of the Wrapping Paper Manufacturers' Service Bureau.

W. J. Raybold, chairman of the Special Finance Committee, supplemented what had been told by President Stokes in regard to the financial difficulties of the association. Along in December, he said, the officers woke up to find that the funds to run the association had been exhausted. The measures taken to remedy the situation were then described as told above.

At this point, President Stokes appointed a Committee on Nominations to draw up a slate for the election of officers.

Announcements by Secretary

Before presenting his report for the year, Executive Secretary Baker made several announcements, including one of a visit to the Hell Gate power plant arranged by Edward B. Cowles, of the American Engineering Company. He called attention to the subscription blanks for "Our Judge Moore's" book on *One Thing and Another* and made an appeal to all who had not yet ordered a copy of the book to do so now.

Secretary Baker then presented his annual report as secretary-treasurer. This will be found on another page in this issue of Paper.

He followed his report with an audit of the association's finances by a firm of certified public accountants, and both were adopted as read.

Secretary Baker then read the text of a resolution adopted by the Salesmen's Association of the Paper Industry, and before action was taken on this resolution he read several excerpts from his own annual report covering the paper and import situation.

Resolution Offered by Salesmen

The resolution presented for action by the Salesmen's Association was worded as follows:

"Whereas the paper industry of the United States is suffering from the continued and increasing volume of cheap made foreign paper imported and put upon the market of the United States at prices less than the said imported papers can be produced in the mills of the United States, and

"Whereas the paper mills of the United States are wholly unable to meet this pirate competition due to the fact that they must pay their American workmen the highest prices for labor on earth and also the consequent high raw material trnasportation and tax charged, and

"Whereas charges are freely made and widely circulated to the effect that quantities of this cheap and foreign paper are coming into this country falsely classified and evading the customs law of the land, and

"Whereas these import abuses and crimes demand that the entire membership of the paper industry in the United States do immediately create and erect some adequate and powerful agency which shall put an end to this strangling menace to our industrial properity, and

"Whereas the paper industry in the United States is today without any such powerful and adequate agency for the purpose required, and

"Whereas, it appears that the one sole reason why no such immediate competent and adequate measures are available to cope with this import menace is because of the lack of some comprehensive plan backed by sufficient funds to make it effective, and

"Whereas, we believe that our American paper markets exist primarily for the benefit of the American manufacturers, workmen and consumers and further that American people will buy American paper to the exclusion of cheap made foreign made paper products if they be shown the perils that confront their American industry, and

"Whereas, we believe that the perfection and adoption of some adequate plan backed by sufficient funds and directed by the American paper industry as a whole is the proper manner in which to proceed to educate the buyers of the United States in favor of the American paper products and to correct and put a stop to the unlimited entry of the cheap foreign papers into this country,

WARREN B. BULLOCK
Who has waged the war on import violations

Therefore, be it resolved by the members of the Salesmen's Association of the Paper Industry in annual meeting assembled on this eighth day of April, 1924, that we do hereby call upon the executives of the American Paper and Pulp Association to take some immediate action toward the adoption of some adequate plan backed by the requisite funds necessary for the protection of the American paper market from the invasion of the cheap made foreign paper products, and be it further

"Resolved that the Salesmen's Association of the Paper Industry pledges 100 percent cooperation to the American Paper and Pulp Association in any and all efforts it may undertake for the adequate grappling with this huge problem.

"Resolved, that a copy of these resolutions be transmitted by this association to the president and secretary of the American Paper and Pulp Association with the request that the subject matter of these resolutions be made a matter of consideration at their annual meeting on Thursday next April 10."

Advocated by Secretary

Secretary Baker called attention to a statement covering the paper and import situation which he had made in his report for 1922. After a reference to the great quantities of paper then being brought into the country under improper classification he recommended that the industry should have a man who understands thoroughly the importation of paper who could keep close touch with the larger ports to see that paper is brought in under right classification, and secure information as to importations. Such work, he said, could not be done with the present force of the association.

Again in his report for 1923, Secretary Baker returned to the subject and said:

"A very important piece of work could be done for the industry by the association having in its employ a man who understands thoroughly the importation of pulp and paper. Every time that a shipment of paper is brought into this country undevalued or wrongly classified it injures the industry. No one can estimate the amount of paper that is being brought in and wrongly classified and undervalued. The association is keeping in as close touch as it can with customs officials at the Port of New York and elsewhere and the specific cases which the customs officials of New York have brought to the attention of the association in the past six months are clearly indicative of the very great help which could be given the entire industry if this work could be handled in a more effective way. Furthermore, such a man could keep the industry thoroughly informed as to the pulp coming into this country, how much is in warehouses, etc. The value of this information does not need to be enlarged upon—your secretary is so convinced of the necessity of service along these lines that he will continue to emphasize them in the hope that eventually such service may be given— and the wonder will be then that the service was not given before."

Had Asked For

He reminded the members that he had asked that the association be given a customs expert to assist in the carrying on of the work, and pointed out that if the industry was facing a period of declining prices, with keener competition and lower margins of profit there was greater necessity than ever that the association do more aggressive work in meeting this situation.

After E. W. Kiefer, of the Port Huron Sulphite and Paper Company, had moved that no action on the resolution be taken at this time, the whole matter was referred for consideration to the incoming executive committee.

Simplification

W. A. Durgin of the Department of Commerce was then called upon to address the meeting on the subject of "The Simplification of Paper Sizes".

Mr. Durgin said the work had been going forward most encouragingly and that the fact was being driven home that the function of the distributor is to serve the consumer at a profit rather than to merely give the consumer what he thinks he wants. There was no need to worry about the distributor and consumer fields but the simplification program would not go nationally unless it had the endorsement and support of the producers. He urged that the pledge to the program be signed. "It simply binds you to use your best efforts to conform to certain sizes," he said. 'We have no police power," however, "and cannot send you to Leavenworth if you fail to conform to them. The signing of the pledge simply places you on record as in favor of simplification in your business."

Demand for Simplification

Mr. Durgin said the government was not in this on its own initiative but that there was a real demand for simplification and the government was only functioning to get all the factions together. "If only one branch got into it," said Mr. Durgin, "I suppose someone would raise a hue and cry about being in restraint of trade. But the time has come when we must go through with this or cast it into the discard for all time. It will either become a great benefit to the industry soon or we would like to withdraw from our efforts very soon."

Resolution Adopted

Following this address a resolution on the subject was adopted. It read:

"It is the sense of this meeting to get behind the paper simplification program to the limit and make it effective in the shortest possible period of time."

Review of the Woodpulp Situation

A statement on the woodpulp situation was then presented by E. W. Kiefer, president of the Port Huron Sulphite and Paper Company, as follows:

"Seven years ago I addressed you on the subject of pulp and the expansion then taking place in the industry and the effect it was likely to have, and it may be well to recall the situation at that time in an effort to properly evaluate the present.

"Before the war domestic manufacturers were shipping 9,000 tons of unbleached sulphite pulp which they had increased to 15,000 tons per month to take the place of the 6,000 tons per month previously received from Germany and Austria Hungary.

"During the last year 1923 these countries had fully recovered their position in the American market by shipping 85,000 tons of unbleached and bleached chemical pulp against the same amount in 1912. In addition to this Norway has slightly increased her shipments from 82,000 to 87,000.

Growth of Imports from Europe

"Sweden has increased three fold from 121,000 to 319,000 and Finland has made the astonishing jump from 4,000 tons to 102,000 tons, or the total importation from European countries has risen from 1,000 tons per day to 2,000 tons per day. Canada has gone from 53,000 tons to 777,000 tons, or our total importations have risen from 353,000 tons to 1,377,000 tons, nearly four times as much, in the last ten years. While this has been taking place the production American Sulphite has remanied stationary or slightly declined from 1,450,000 to 1,375,000 tons and soda in about the same proportion from 437,000 tons to 419,000 tons, Kraft jumping from 85,000 to 243,000 tons, due mainly to the building of southern mills, which expansion is still going on at a rapid rate.

Look for Increased Imports of Groundwood

"Now these statistics are interesting when analyzed but in view of the fact that European imports of groundwood have risen from 4,000 tons to 66,000 tons, we may as well proceed directly to the point, and that is that European pulpwood will continue to come over in constantly increasing quantities in the shape of groundwood and chemical pulp and newsprint until the cost of the wood at the mills in the two continents is approximtely equal.

"The traditional difference in labor cost will favor the European producer and become as in past years just about equal to his ocean freight. The cost and wood at the mills making their own pulp cannot exceed the European's price plus the freight of that pulp to the American mill.

"Now what is that cost of wood and how are we to face the issue. I had the pleasure of recently being visited by the president of one of the large Baltic Mills who was quite frank about his operations. His wood cost the equivalent of $9 per rough cord of 128 cu. ft. laid down at his mill. Inasmuch as his company has practiced forestry for some forty years and has nearly 800,00 acres under its management it seemed unlikely to him that his wood cost would change materially in years to come; in other words, this cost was a staple cost based on cost of raising, cutting, etc., and not as with us, constantly being driven by depletion of a natural resource.

High Cost of Wood

"In prewar years the price of pulpwood was fairly steady at $6.75 per cord, averaging the rough and peeled which has advanced to $10.50 on board cars or vessel at point of shipment, an advance of 55 percent which is not much more than the advance of other commodities but when we consider the rise of the cost of transportation due to various causes but mainly that of greater distance, and we see that the price at the mill has jumped from about $10 to $20, that the real significance of the European's staple price of $9 per cord at the mill is fully appreciated.

"It is plain to be seen that as long as the European has the advantage of $18 to $20 per ton on the manufactured pulp that this advantage is not to be offset by an ocean freight of some $5 plus a rail freight of $7 per ton and that the American manufacturer cannot even afford to make pulp for himself much less sell it unless his wood cost is not over $30 per ton of pulp, unless he is making a very special product.

Cannot Compete with Europe

"Not only has this situation practically stopped the manufacture of sulphite for sale, but there is great question whether it has not also stopped the growing of trees on this continent in competition with European forestry before ours has even got fairly started. Unless your woodlands are in your own back yard it would indeed be a brave man who would venture on a policy which would entail millions of dollars on an enterprise unprotected by any tariff and in competition with a strongly intrenched and low cost competitor.

Impossible to Copy European System

"Gentlemen I have devoted my time almost entirely to the pulp or pulpwood situation, as we should be a body of men entirely free from bias on this question and above all not carried away by sentiment. Much as forestry is needed in this country I see little hopes for its successful future in the face of the practical difficulties before it.

When we inquire still further into the low price of European pulpwood we find additional reasons for it. They run saw mills in connection with their pulp plants where every bit of waste is worked up, also wood charcoal and extracting plants to utilize the small stuff, the limbs being sold for faggots and fire wood. Just where in this country with our immense coal resources there is any place for such economics it is hard to see. So we may at once boldly come to the conclusion that wherever paper prices are based on our wood costs and not on European pulp they will not endure and we must do what is necessary to set our house in order by using imported pulps or by bringing our costs to an equivalent basis. So far, it seems that the tendency to do this, has shown itself in the closing down of the smaller and weaker mills and the bonding of the larger one in an attempt to provide sufficient capital to utilize lower operating costs. This course tends to further over production.

Advocates Intense Specialization

"In conclusion, I wish to leave this thought with you that only by intense specialization will the day be saved and a reasonable profit assured. Concentrate on as few lines as possible instead of as varied a product as possible. Make your name stand for the best there is in some one thing and it will bring you unsolicited business in that line. Equip your mill to make that grade that is the most advantageous, considering proximity of the market, the cheapness of the particular raw material required, and last but not least, train your force in the making of that one grade of paper until they are past masters of the art.

"This will not only help to cut selling, distributing and manufacturing costs, but each cobbler sticking to his own last will prevent, to some extent, the making of prices by the inexperienced and give a chance to those who devote themselves to a single line of paper from having to compete with the fellow who will quote on anything from Oxford bible to newsprint on the same sets of costs in an effort to keep his machines running when his own line is slack.

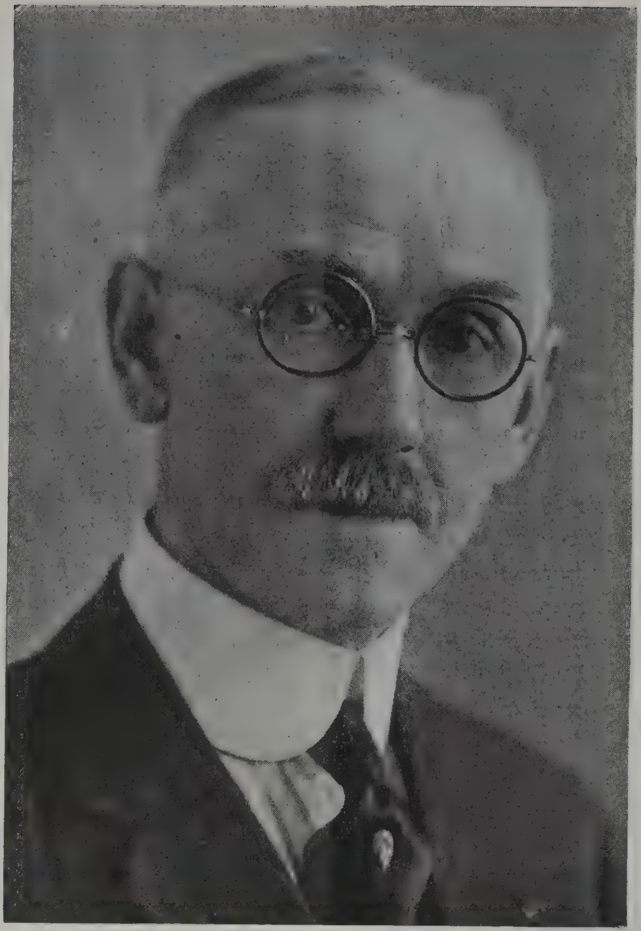
"If therefore this industry like some others which have achieved notable successes, can turn out a greater amount of production per man than the European, standardize its products and its machines until they are the world's best and emphasize specialization instead of diversity of product, then only may we hope to be ranked as one of the successful and valuable branches of American industries."

Review of Wrapping Industry

Mr. Kiefer was followed by C. R. McMillan, of the Union Bag and Paper Corporation, who announced that he would give a bird's eye view of the situation in the coarse paper field. He contrasted conditions in Europe when papermakers specialized on the manufacture of particular papers, and said this might be stimulated here where the tendency was to spread out in too many difficult directions.

Too Many in the Field

The coarse paper industry had not prospered to the extent it should have. It does not yet yield reasonable profits to the manufacturers and dealers. In this respect it stood fifteenth among the sixteen leading industries of our country. He pointed to the steel industry in which one company represented 50 percent of the net investment. There were altogether too many mills operating in the coarse paper division. Speaking figuratively, he said there were 250 men attempting to manage a fleet of 125 boats, and until all learned to use the same chart and compass, or until the number of ships in the fleet was cut down to smaller and stauncher units, he could see little hope for the coarse paper industry.



GEO. W. SISSON
Chairman of Resolution Committee

Report on Condition

Charles McKernon, of the B. D. Rising Paper Company, reported the fine paper industry to be in generally good condition, though the writing paper mills were at the present time operating only at 95 percent of normal capacity.

The price of raw materials had increased, the cost of rags being 21 percent greater than in 1923, but better freight service and lower cost of pulp had benefited manufacturers to some extent.

Officers Elected

President Stokes called for the report of the Nominating Committee. W. F. Brunner, chairman, who submitted the following list of nominations for officers to serve during the ensuing year. He prefaced his report with a statement that five members would constitute the executive committee and that the presidents of affiliated organizations would continue to serve as an advisory council. The new executive committee was chosen to represent different branches of the industry as follows:

Fine Papers—Philip Weston, of Weston, Byron Co., Dalton, Mass.

Wrapping Paper—Herman Elsas, of Continental Paper and Bag Mills, New York.

Book Paper—Frank J. Sensenbrenner, of the Kimberly-Clark Co., Neenah, Wis.

Vegetable Parchment—William F. Brunner, of the Paterson Parchment Paper Company, Passaic, N. J.

Boxboard—George M. Seaman, of the Eddy Paper Corporation, Three Rivers, Mich.

President Stokes

The officers, president and vice presidents were reelected as follows:

President—Henry W. Stokes, York Haven Paper Co., Philadelphia.

Vice President—Norman W. Wilson, Hammermill Paper Co., Erie, Pa.

Western Vice President—Alex Gilman of Allied Paper Mills, Kalamazoo, Mich.

There being no other nominations, Secretary Baker was instructed to cast one affirmative ballot for the officers named and they were declared duly elected.

Resolutions Adopted

Before the meeting closed, George W. Sisson, chairman of the Committee on Resolutions, presented three resolutions for adoption. One declared the association's approval of the McNary-Clarke bill now before Congress and urged its immediate passage. The other commended the work of the U. S. Forest Service and particularly the Forest Products Laboratory at Madison, Wis. The third resolution asked for early and prompt action on the tax problem, and a wise distribution of government appropriations.

Reopen Mill

Because of favorable market conditions the sawmill of the Whalen Pulp & Paper Company at Swanson Bay has been reopened. The plant was turned over on March 5 for the first time since the shutdown last December and it is now sawing lumber steadily. The shingle mill may also be reopened. A. C. Devine from the Vancouver office of the company has assumed the managership, succeeding R. L. Hennessy.

It is the intention of the Whalen Company to operate its logging camps on Moresby Island, Queen Charlotte Islands this summer. The camp at Cumshewa, which has been running all winter, will continue.

The Whalen Company is seeking permission from the government to export No. 3 cedar logs from its camps to the Orient. Pulpwood and slabs will be piled up at the Swanson Bay plant against the possible reopening of the pulp mill when market conditions improve.

T. A. P. P. I. Makes Real Progress

Work of Past Year Is Reviewed and Developments Noted—New Methods Are Requested

THE NINTH ANNUAL MEETING of the Technical Association of the Pulp and Paper Industry was opened by President Howard S. Taylor in the Myrtle Room of the Waldorf-Astoria, New York, on Tuesday, April 8, at 9:45 A.M. After greeting the assembled members, he proceeded to read his annual address, as follows:

President's Address

It is with great pleasure that I greet you at this the opening meeting of the ninth annual convention of our Technical Association. I am greatly pleased to see this meeting so well attended.

The association during the past year has shown a healthy progress, our membership rolls having been considerably increased. New members as well as old have shown the spirit of co-operation to a very satisfactory degree, and at the same time given the chairman of the different committees most commendable support.

HOWARD S. DAYTON
Re-elected President of T.A.P.P.I.

The work of our association must to a great extent depend upon the work of the different standing committees, and it is on the chairmen of these committees that we must depend to bring the work before the association. There is, therefore, a call on the association as a whole to work and co-operate in assisting these chairmen and their committees in every possible way.

During the past year new subjects have been investigated by different committees, and further investigation proceeded with on those subjects with which we are already familiar.

With the exception of that on the sulphate process the committee on wood-pulp processes have maintained active interest in the improvements to these processes, both in methods of control and in following the mechanical improvements made here and abroad.

Sedimentation or Freeness Test for Groundwood

In groundwood production the use of the freeness test as a means of control has become firmly established, and at the present time is in use by practically all progressive groundwork mills. It is recognized, however, that this test needs standardization.

During the year the chief advance to be noted for groundwood is the development and application of grinders whereby a continuous grinding pressure is obtained by means of chains in combination with the weight of the wood in the magazine. Grinders of two designs are in use in a number of plants, operating successfully under widely different conditions.

Hopes for Revival of Sulphate Committee

Under sulphate pulp I regret to say that for the past two years it has not been possible to arrange a committee on this subject. The recent organization of the southern kraft manufacturers and the co-operative work done by a number of the middle western sulphate mills are encouraging signs for this branch of the industry. It is to be hoped that the sulphate pulp committee may soon be revived.

Work on Standard Testing Methods

The signal achievement of the Paper Testing Committee in publishing *Paper Testing Methods* is being emulated by the Committee on Standard Methods of Testing Materials by arranging the approved methods for publication in similar form. These two handbooks with the set of textbooks and a few additional works that are now available will form an extremely valuable library for anyone engaged in the industry. Should our Technical Association have nothing else to its credit except the books I have mentioned, its existence would be amply justified.

Developments in Other Committees

The work of the Dyestuffs Committee during the year has been the preparation of the section on Coloring in the fourth volume of the textbooks. Those on Cellulose and Coated and Processed Papers have developed satisfactorily as has the Committee on Paper Drying. This last committee has shown the results of its active work in the formation of a code for paper drying. In its present form it is being used by a number of mills, by which the efficiency of the drying may be determined and the results of different mills compared.

The development of a vacuum paper machine drier on a semi-commercial scale by one of our members is worthy of record and its application in the industry will be awaited with interest.

Investigation of Waste

Since its formation two years ago the Waste Committee has carried out excellent work and reflected much credit on the association. Besides carrying the work of last year through to completion at this meeting, it has undertaken the investigation of equally important subjects of a different character. The subjects continued are White Water Losses and Their Prevention, the Utilization of Barking Drum Refuse as Fuel, and Broke Losses and Their Reduction, on which concluding reports will be made.

New Subjects of Study

The new subjects which are equally important to the industry are Heat Losses in Pulp and Paper Mills, Mechanical Handling of Materials in Paper Mills, the Utilization of Decayed Pulpwood Resulting from the Attacks of Insects and Fungi. The only thing to be feared is that too much may be undertaken at one time. Judging by the work which the committee did last year, however, and from its progress report at the fall meeting it would appear to be able to handle the large volume of work most creditably.

Heat, Light and Power

The Heat, Light and Power Committee is to report progress. In its field one of the mills is reported to have installed a power plant consisting of a boiler operating at materially higher pressure than customary and a steam turbine exhausting at a back pressure of 150 lbs. into the regular steam supply, and we hope to hear more about this installation.

Service to members started at the beginning of the year has met with considerable success. A number of important problems have been dealt with and the members who have co-operated have thereby been benefited.

Industrial Education

Under vocational education the work has gone forward with its usual success under the direction of the committee. With the publication of the fourth volume of the textbooks the large work undertaken five years ago is nearing completion. With the set of textbooks for the industry the next responsibility of the association will be to secure a wider use not only of the textbooks but of the correspondence courses centering about them which have been provided.

During the year the relations between our association and the Paper Trade Journal, in which the Technical Association Section has been published, have been most satisfactory.

Praise for Abstracts and Bibliography

The work of the Committee on Abstracts and Bibliography has been a material help. In editing the abstracts and the preparation of the index to the Technical Section, besides preparing a bibliography for the year, the chairman of the committee is to be highly complimented on the work that he has done.

We have the regular meeting now before us that will bring out new subjects of interest, which will I trust prove most enlightening and be enjoyed by all. Let us all grasp the true spirit of such a meeting as ours through the possibility that it provides for comparing the different problems and viewpoints that each one of us has, and thereby become one and all for the best interests of our Association and the Industry that it serves.

W. G. MacNaughton, secretary, reported a satisfactory increase in membership for the year. The total membership on March 31, 1924, was 571, classified as active 347; associates, 102; juniors, 90, and corporate members, 32. He announced that a compendium of approved methods for testing materials used in the industry would shortly be put on sale at $2 to members and $3 to others. The work has been compiled by the Committee on standard methods of Testing Materials of which Miss Helen U. Kiely is chairman.

Service to Members

Last year a plan was put in operation for cooperation among the members on manufacturing and technical problems. Specific inquiries by members covering their problems are published or distributed to the members in blank and replies invited. A transcript of these replies is made and distributed to those who have contributed information. In this way problems have been handled relating to a variety of subjects, specimens being as follows:

1—Substitute for poplar for soda pulp
2—Proper relation in width of felt and press rolls
3—Causes and remedies for the liming of blowpits in sulphite mills
4—The kind of prime mover for the paper machine
5—A problem in the distribution of power for costs
6—The proper method for storage of pulp
7—The interpretation of paper tests
8—The sizing of paper in the presence of calcium carbonate
9—Cleaning solution for Fourdrinier wires
10—The causes and remedies for high sulphur consumption in sulphite mills

Cooperation research was suggested to discover a substitute for casein in the manufacture of coated paper. The secretary suggested that manufacturers who are interested and ready to finance a research study should form a committee to take charge of all details with authority to act.

Planning Future Activities

Secretary MacNaughton reported that the executive committee had under consideration the question of joining the American Society for Testing Materials so as to be in a position to cooperate in some of the work it is doing. The suggestion is made that the Committee on Standard Methods of Testing Materials and the Committee on Paper Testing be made subdivisions of one Materials Testing Committee to consider raw materials and products of manufacture.

It was noted that the committees on Waste and Paper Drying have plans for cooperative work in their particular fields. White water losses, as the Waste Committee points out in its report is related to the question of stream pollution. While much of the stream pollution charged to the paper industry is exaggerated it is unquestioned that the prevention of losses of fiber and other materials in the mill effluent would automatically take care of stream pollution and at the same time be a profitable undertaking for many manufacturers. Credit was given to the Forest Products Laboratory for support and cooperation in the work of the Waste Committee.

Adoption of a Drying Code

The Committee on Paper Drying in cooperation with a similar committee of the Canadian Technical Section has compiled a Drying Code by which it is possible for mills with the ordinary equipment to compare their results on the same basis.

Secretary MacNaughton referred to the many problems in pulp and paper manufacture seeking solution and said it was through cooperation such as is being stimulated by T.A.P.P.I. that the entire industry may be greatly advanced.

He spoke of the revision of the articles of association in which provision is made for the formation of local sections of the association. He expected that the incoming executive would undertake the organization of a number of active sections in logical papermaking centers which would benefit the industry at those points.

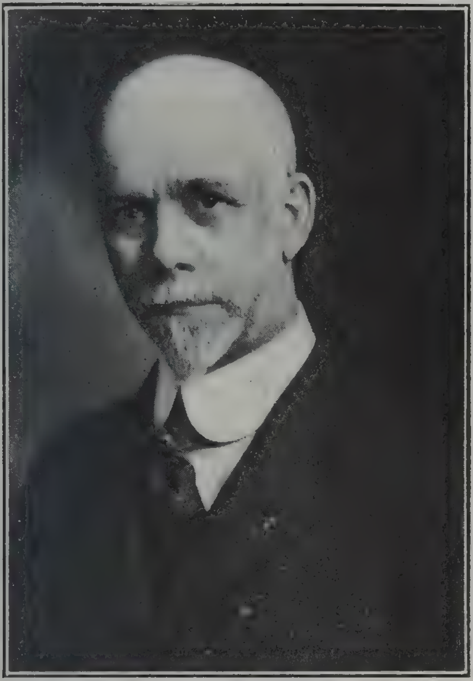
The report of the secretary was adopted.

State of the Treasury Reported

Some details of the auditor's report on the finances of the association were then given. The total income for the year amounted to $13,186.28, with expenditures of $10,666.71, leaving a balance on December 31, 1923, of $3,453.67.

Executive Committee Reports Briefly

For the Executive Committee, Royal S. Kellogg reported briefly. He said there had been fewer meetings of the executive committee during 1923 than in any other year. He placed emphasis on the proposal to form sections of the association and made it as a recommendation that steps be taken at once to effect organizations of this kind. He hoped to be able to report four sections in operation next year.



GEORGE H. HARVEY
Middletown, Ohio

Reports of standing committees were then called for, but only a few chairmen were in attendance, and such as were either reported progress or announced that the reports would be discussed in sectional meetings on the following afternoon. The Committee on Waste, R. B. Wolf, chairman, and the Committee on Paper Drying, F. R. Hyatt, chairman, were to meet in the Myrtle Room following the forenoon session. W. W. Cronkhite, for the Heat, Light and Power Committee, spoke of a certain lack of cooperation on the part of engineers with the work of his committee and stated there would be no formal report presented.

Miss Helen U. Kiely said the Committee on Standard Methods of Testing Materials had held two meetings during the year. A comprehensive report had been prepared and this would be issued shortly as a separate publication.

The revised articles of organization, embodying the Constitution and By-Laws of the association, were presented for adoption, the new sections being read by the secretary. A motion to adopt was promptly seconded and passed without debate. The text of the Constitution and By-Laws under which the association will now operate is as follows:

The Vocational Education Committee reported through Raymond S. Hatch, chairman, that it was in possession of sufficient funds, some $6,924, to complete the series of textbooks by the early publication of Vol V. A royalty fund was being accumulated and held in reserve for the payment of expenses connected with the revision of the volumes. A total of 6820 copies had been sold. Volume III proved to be the best seller, the number sold to date totaling 2036 bound copies and 181 sections or pamphlets. It is likely that sales of Vol. IV will exceed this, as 1052 copies in cloth binding have been already sold and 61 of the loose leaf or sectional volumes. It is the expectation of the committee that Vol. V will sell fully as fast as Vol. IV.

At the suggestion of Grellet N. Collins, B. T. McBain was invited to give an account of the course in pulp and paper manufacture as conducted at the mills of the Nekoosa-Edwards Paper Company at Port Edwards, Wis., under the auspices of the mill owners and management.

Mr. McBain said that courses had been carried on for three seasons. The first season's experiment was a complete failure. New methods were tried the second season and the result was an entire success. The secret of success laid in getting the superintendents and foremen interested and insuring their attendance both as pupils and instructors. It was the only way to make a success of industrial education. The system of instruction by the use of the textbooks on the manufacture of pulp and paper and the aid of professors and teachers in local colleges worked out satisfactorily at what is now called Nepco college, of which Mr. McBain is dean. The education of mill operatives in Wisconsin was also being taken care of by the Forest Products Laboratory, of Madison, in cooperation with the University of Wisconsin Extension Division. The extension course in pulp manufacture is in charge of Dr. C. E. Curran of the Pulp and Paper Section of the Forest Products Laboratory. The Nekoosa-Edwards Paper Company is at an expense of $48 a week for instructors. The company pays the enrollment fees of workers and the cost of books which are afterwards deducted by instalments from the pay envelope of the enrolled worker. Those who complete the course successfully get a refund of the fees paid. Some fifty of the employees are now taking the course.

The methods of instruction followed at the mills of the Strathmore Paper Company in Mittineague and Woronoco, Mass., were described by George E. Williamson, who is executive engineer of that company. Immediately after the publication of Vol. I of the textbooks a class was started, but it was not a success. Many of those who enrolled to take the course dropped out early, giving as an excuse that others in the class had the advantage of them in preliminary education. A system of correspondence teaching was then tried and as an inducement the company offered to refund tuition fees to those students who had been awarded certificates.

GEORGE K. SPENCE
Chairman of Committee on Soda Pulp, T.A.P.P.I.

Mr. McBain mentioned that sundry courses for the use of the textbooks were being carried on at Rothschild, Wis., by the Marathon Paper Mills Company; at Neenah and Appleton by the Kimberly-Clark Company and at Mosinee, by the Wausau Sulphate Fibre Company.

John D. Rue, of the Forest Products Laboratory, Madison, Wis., was asked to give his views concerning the best methods of conducting courses and he advocated an adoption to the capacities of the men. It was most important, he said, to lead the men on slowly.

Royal S. Kellogg, secretary of the Newsprint Service Bureau, told of inducing the stenographers and filing clerks in his office to take the course of instruction as a means of improving their education, and he had been much gratified with the results.

Martin L. Griffin spoke of the value of getting the cooperation and support of the mill superintendents as a means of getting apprentices interested.

H. O. Keay, of the Laurentide Company, Grand' Mere, P. Q., said his company was cautiously observing activities in the movement for industrial education. One of the difficulties encountered in Quebec was the inability of the French Canadians to learn English. Steps were now being taken to provide a French text of the Vocational Education course. The iron law of inequality had to be faced despite the declaration in the Constitution of the United States that all men were created free and equal. The pace must be maintained so that the slowest intellect among the students would not be discouraged and it was of the highest importance to organize the superintendents. The textbooks provided the most powerful instruments for the education of workers and the Laurentide Company was in full sympathy and desired to be of the greatest service in the movement for a correspondence course in pulp and paper manufacture.

L. M. Alexander, president of the Nekoosa-Edwards Paper Company, denied the validity of Professor Keay's statement concerning equality. There was equality in all things, he said, only opportunity might be lacking. He entertained the members with the story of a German farmer who was handicapped by inability to write or sign his name. He was forced to learn reading and writing and was soon able to sign checks on a bank.

J. J. O'Connor, of the Mead Pulp and Paper Company, Chillicothe, Ohio, told of courses in Practical Economics which had been started by an instructor from the Research Academy and had yielded good results. The men had become interested in the course because they were given subjects of study in which they had some practical working knowledge. Work in operation was studied in connection with the textbooks and not the textbooks as the prime study.

E. C. Tucker, of the Chemical Paper Manufacturing Company, Holyoke, Mass., advocated the short course feature. Failure to interest students was attributed by him to efforts that were made to gulp the system at once, instead of taking it in small doses. A good many small doses would make a big ending.

Thomas J. Keenan advocated a return to the old apprenticeship system, by which beginners could get graded courses of instruction in special operations.

Edwin Sutermeister of S. D. Warren Company, Cumberland Mills, Me., emphasized the importance of providing personal incentives to study by a system of promotion for excellence in studies.

George K. Spence, of the New York and Pennsylvania Company, Johnsonburg, Pa., said that his company had not approached the subject of industrial education from any angle whatsoever, but he was convinced of the value of the work and agreed with Mr. Sutermeister that an incentive in the way of promotion should be provided.

W. G. Mac Naughton, secretary of T.A.P.P.I., expressed the opinion that vocational education and training in mill operations should be handled in the same manner as any manufacturing problem. It must be decided by the management whether it is a good thing or not, and its cost estimated. It was essential that the idea should be sold to the management, and applied systematically to the workers in the mill, the entire arrangement being put on a business basis. A proper combination of theory and practice should be employed. At McGill University from which he was graduated, he had observed that students taking the mining course did better than others, because they were required to spend part of their vacations in practical mining operations, whether handling a pick, pushing a barrow, or handling a transit and level.

This closed the discussion and President Taylor announced the appointment of a Committee on Nominations and a Committee on Recommendations, George E. Williamson being named chairman of the first named with W. W. Cronkhite and Fred C. Clark as associates, and Martin L. Griffin, chairman of the second committee, with Thomas J. Keenan and Edwin Sutermeister as associates.

After sundry announcements by the secretary the forenoon sitting was adjourned.

Afternoon Sitting, Tuesday

Robert B. Wolf, presided at the opening of the afternoon sitting when the Committee on Waste reported on the utilization of pulpwood bark for fuel, a preliminary discussion being carried on in reference to white water and broke economies. The reuse of white water drainings at every point was emphasized. The installation of save-all and other devices for the recovery of lost fiber was urged. In discussing the value of such equipment it developed that widely varying results have been obtained at various mills. A questionnaire is to be sent out by John D. Rue of the sub committee to mills interested in the problem and data compiled and compared in order that standard methods might be established. The problem of conserving mill effluents is of immediate concern in view of the prospect of legislation prohibiting stream pollution with mill wastes. Many states have laws or pending legislation regarding stream pollution. Among these are the states of Massachusetts, Michigan, Wisconsin and Pennsylvania. If the individul pulp and paper mills study and solve their problems, the report stated, they will not only reclaim fiber that is of appreciable value, but will also meet the requirements of any laws or inevitable legislation regarding stream pollution.

In reference to bark and refuse utilization the report now in course of preparation will contain all available data upon bark presses and the furnaces now used in the utilization of wood and barking refuse. The report will cover the various methods of handling this problem under different conditions, and will give figures that will indicate the improved results that can be obtained with adequate equipment and proper control.

Appreciable savings can be effected by the more economical utilization of bark and while tests indicate that each mill has its own particular problem, the construction of the furnace, control of the air, and the method of feeding the fuel are three points that must be given special attention. In general, all refuse must be approximately 50 percent dry in order to be burned with reasonably good efficiency.

The report considered the reduction of broke losses and heat losses: handling materials in pulp and paper mills and the utilization of decayed wood for pulp.

The handling of materials is a very important item of cost in the manufacture of paper which has greatly increased during the past few years on account of the rapidly increasing cost of labor. Each mill has its particular problem and a study of the cost of handling a commodity under present methods compared with the installation and handling cost with modern equipment should be thoroughly investigated.

The Utilization of Decayed Wood for Pulp

This is one of the most important problems that confronts pulp and paper mills at the present time. Realizing that it is an international problem a Joint Committee was appointed to co-operate on this work, representing the Technical Association, Woodlands section of the Canadian Pulp and Paper Association, the Forest Products Laboratory and the Newsprint Service Bureau and during the present year the co-operation of the Woodland section of the American Paper and Pulp Association. Much valuable information has already been obtained and further reports will be submitted to the Technical Association as the work progresses.

Recommendations

In conclusion the committee made the following recommendations:

The committee believes that its main function in the future should be to assist the regular standing committees to take up problems dealing with the elimination of waste in their respective fields. The committee should act as a coordinating medium with such organizations as the Forest Products Laboratory and the Bureau of Standards in order to make available the results of their findings. The committee should also assist these agencies to continue their co-operative studies on waste elimination problems at the various mills interested in this work.

The Minton Vacuum Dryer

Ogden Minton gave an interesting account of the developments leading up to the construction of a paper dryer in which the vacuum principle is used. The text of his address is published in full on another page in this issue of PAPER. One of the great advantages of the Minton Vacuum Dryer, as pointed out by Mr. Minton, was the ability to dry paper at a comparatively low temperature with steam inside the rolls at a pressure of 5.3 pounds. The claim is made for the vacuum system of drying that 100 per cent thermal efficiency is obtained in less space than is occupied by ordinary dryer stacks. The dryers are enclosed in a high vacuum, which acts much the same as a thermos bottle, giving up heat to paper in contact with them. There is great economy of heat as no air is present to absorb and carry away heat units. The only heat loss is that by radiation from the cast iron case in which the dryers are enclosed. As noted in the text of Mr. Minton's address, with a vacuum of 28 inches of mercury, the temperature of evaporation will be about 100° F., the vapor given off having the same temperature.

Mr. Minton pointed out that when using a vacuum of 28 in., the water going to the hot well of the condenser will be approximately 90° F. This warm water could be used in the beaters or in the flow box of the paper machine instead of the ice cold water which some of the northern mills have to use in paper.

Drying Code Adopted

The adoption of a drying code, or a data sheet on paper drying precipitated some discussion. Objection was made to some of the figures on absorption of heat units by dryers, but is was explained that the code was open to amendment. The figures obtained by a careful comparison of data supplied by the Laurentide Company, Crown-Willamette Company, Pejepscot Company, Consolidated Water Power and Paper Company, Great Western Paper Company, American Writing Paper Company, the Beckett Paper Company, the Chemical Paper Manufacturing Company and the Crocker-McElwain Company supplied

Judge Moore to T. A. P. P. I.

JUDGE CHARLES F. MOORE

(From his sick bed)

Since I cannot be there to meet you,
By proxy I'm compelled to greet you.
'Twere better far to see your faces
While you are seated in your places,
And share the friendship and good cheer—
At this, the round-up of the year.
But since that pleasure I'm denied,
I'll be content and satisfied
To know that you do not forget
The olden days in which we met—
The joyous days that I recall
With gratitude for one and all.
In prison walls I've been confined;
And yet, my lot is not unkind;
For much I've had to compensate
The sore privations of my fate.
Life may not be just what we'd make it:
So much depends on how we take it!
No longer can I hold my place
Within the ranks that move apace;
But, parked beside the great highway,
I watch the world as day by day
It passes by, and I can see
It marching on to destiny.
While pausing here, the load I bear
Is no whit greater than you share,
Who daily meet and struggle through
The task that some one has to do.
While I still linger in the rear,
You man the trenches, without fear;
And fight the battles some must fight,
If we would still maintain the right.
Then why should I complain when you
Have both your work and mine to do?
It seems to me—the truth to tell—
That I should pity you who're well
While here I sit and wait and rest,
My passing days are doubly blest;
And thus the benefits I gain
Repay me well for all the pain
That I endure—repay the cost
Of all the blessings I have lost.
While many things I've been denied,
My friends indeed have multiplied;
And they have filled my days with cheer
And helped me through the lingering year.
They've put new courage in my heart,
And made me brave to do my part
As best I can—they've taught me more
Of friendship than I knew before.
In spite of some who still deceive,
My friends have taught me to believe
That men are true—that I can trust
Them to be generous and just.
In fervent faith I'll ever laud
My friends, my country and my God.

useful figures concerning the amount of heat used in drying at the various mills. In a summary it was shown that for heat units used per pound of water evaporated from sheets amounted to 1263 while the water evaporated per square foot effective drying surface per hour was 3.659, nearly double the amount of paper dried per square foot. The steam used per pound of paper dried amounted to 4.025. Variations in the foregoing figures ranged from 2030.8, 1224.6, 1067 and 1370.7 for total overall heat units used per pound of water evaporated from sheets, as compared with the first figure given—1263. The variation noted was not so great under other headings, though all were a few degrees lower.

Asbestos Coverings for Digesters

At the afternoon sitting there was an animated discussion regarding the value of asbestos coverings on digesters. Many of those who took part in the discussion denied any saving of heat while others took an opposite view. Mr. Wolf had previously resigned the chair to G. D. Bearce who said that if a saving was to be effected by the asbestos covering it would probably take a period of three years to determine it. Mr. McBain had previously reported the opposite of a saving of heat by use of asbestos coverings. Another member who had reported satisfactory results was asked what flow meter had been used to determine steam consumption and he mentioned the Republic Flow Meter as made by the Republic Flow-Meter Company, Bush Terminal Building, Brooklyn. It was jokingly suggested that if this flow-meter had been used at the Nekoosa-Edwards plant, results from the use of asbestos coverings on digesters might have showed up better.

Third Sitting, Wednesday Forenoon

It was long after the advertised hour before the third sitting on Wednesday was called to order. The first business taken up was the reception of the report of the Committee on Nominations, George E. Williamson, chairman. The officers who served during 1923 were accorded the compliment of reelection and two new members were elected to the executive committee each to serve for a period of three years. They will fill the places formerly occupied by George K. Spence and George H. Harvey, who retired by rotation. The list of nominations as submitted by the committee was voted on and the election declared unanimous.

Officers Elected

During the ensuing year the Technical Association of Pulp and Paper Industry will be officered as follows:

President—Howard S. Taylor, of Dayton, Ohio.

Vice-President—Grellett N. Collins, of Dill & Collins Co., Philadelphia.

Secretary-Treasurer—William G. MacNaughton, 18 East Forty-first Street, New York.

New members of the executive committee are L. J. Parant, of the St. Croix Paper Company, Woodland, Me., and W. E. B. Baker, of the Continental Paper & Bag Mills Corporation, York Haven, Pa. The executive committee consists of seven members, the president and secretary; E. C. Tucker, Royal S. Kellogg, B. T. McBain and L. J. Parant and W. E. B. Baker.

The report of the Committee on Recommendations was then called for. Martin L. Griffin chairman, responded with a series of endorsements of the recommendations in the president's address. Mr. Kellogg of the Executive Committee protested that action should have been taken on the recommendations made in his oral report concerning the organization of four local sections of T.A.P.P.I.

Mr. Keenan replied for the committee saying that nothing had been referred to it for consideration but the president's address. He asked leave on behalf of the committee to submit a supplementary report at a later sitting, which was granted.

In addition to endorsing the recommendation of the Executive Committee relating to the immediate formation of branches of the Technical Association in logical papermaking centers the Committee on Recommendations approved the plan mentioned in the secretary's report for cooperation on manufacturing and technical problems in the way of service to members. It also approved of the suggestion in the secretary's report that the Committee on Standard Methods of Testing should be subdivisions of one Materials Testing Committee covering both the materials used and products it manufactures. Approval was also given to the suggestion of the Executive Committee that the Technical Association join the American Society for Testing Materials. The foregoing was submitted in the form of a supplementary report, the original report reading as follows:

Report of the Committee on Recommendations

Your committee has considered the able address of President Taylor and begs leave to present the following report.

We desire to second the president's recommendation for enlarged cooperation on the part of the whole membership with the committee chairmen and the work they have in hand.

It is a matter deserving of special investigation that the Sulphate Pulp Committee should have been allowed to suspend operations in view of the growing importance of sulphate pulp in the manufacture of paper and the development of this industry in different parts of the country.

The committee recommends that steps be taken to carry out the president's suggestion in regard to the adoption of a standard freeness test for groundwood pulp.

It is in full agreement with the president regarding the importance of an extension of study in such subjects as heat losses in pulp and paper mills, mechanical handling of materials in paper mills, and the utilization of decayed pulpwood resulting from the attacks of insects and fungi, and would recommend that the development of this work be encouraged and its extent left to the discretion of the proper committees.

Your committee is impressed with the potential value of the work of the Committee on Service to Members and expresses the hope that it will be enlarged to the fullest extent that may be possible.

It joins with the president in commending the work of the Committee on Vocational Education in the near completion of the five volumes on the Manufacture of Pulp and Paper and agrees with him that the next responsibility of the Association will be to secure a wider use not only of the textbooks but of the correspondence courses centering about them which have been provided.

The important work of the Committee on Bibliography, of which Clarence J. West is chairman, has reflected credit upon the association as well as upon our entire industry, and we join the president in his felicitations to Chairman West. (Signed) Edwin Sutermeister, Thomas J. Keenan, Martin L. Griffin, Chairman.

Fourth Sitting, Wednesday Afternoon

At the afternoon sitting on Wednesday, Austin Cary of the U. S. Forest Service, presented a paper, illustrated by lantern slides, on "Papermaking Possibilities in the South." It is of striking significance that more than one paper was presented during the week of meetings on the opportunities that are open in the Southern States for the development there of a selfcontained paper industry.

Our Extravagant Use of Paper

Mr. Cary is a forester of great experience, having cruised and surveyed many tracks of timber land both in this country and in Canada. He does not look with a favorable eye on the extravagant use of paper as exemplified by the daily newspaper. To him the raw material would look better standing in the form of a tree in the forest. He confessed that this feeling might be individual or narrowly restricted and he did not hesitate to pay a tribute of esteem to our American pulp and paper industry for its intensiveness, resourcefulness and courage, not less than for its economic service to local populations making for the comfort and convenience of our lives. He reflected on the great and momentous thing which happened when a block of wood was first converted into something so unlike it—a block of paper.

Forest Resources

Turning to the subject nearer in line with his main purpose Mr. Cary said:

"I hope in this paper to make some useful contribution to the consideration now going on of the resources available for papermaking in country-wide fashion. Country-wide, at least, the consideration must be if it is to be adequate. True, papermaking in this country is now mainly located and was developed in the northeast. That as in so many other cases was largely due to the wealth, intelligence and industrial push of the section. It was also founded on natural facilities—available power, labor, supply, particularly on the location here of wood especially suited to the purpose. Spruce, the familiar tree of our boyhood, common, cheap, regarded mostly as part of the scenery and source of spruce gum, proved to have special suitability to papermaking, and for many years there were abundant supplies of it. Forty years of intense activity have made a vast difference, however. In that time the virgin stands of the northern mountains have been cleared off; great areas previously culled for their sawtimber have been combed over again, more than once in many cases; more lately a great natural force, the budworm, has worked tremendous devastation in the resources remaining. Of waste, lack of forethought, negligence, I say nothing here. If the paper industry of the northeast has not a record as clear as might be in respect to these matters to my thinking at least and speaking broadly, it has kept in advance of all other industries in these United States. But the situation is different now than it was forty years ago, or twenty for that matter. The stuff is not there now for continuance at the same rate; other local resources that might be called on are inferior. The question how much wood that available territory will grow, or can be made to grow at economic cost, is therefore presented.

HENRY F. OBERMANNS
Hammermill Paper Co., Erie, Pa.

"That as a purely technical question, though not at all easy, is rather simple. I note that it is being taken up and that it has a place on this program. Even though fully and trustworthily handled, however, the practical problem of the industry is not so settled. Competition comes in from the countries, from other parts of our own, the whole field of transportation costs, tariffs, etc. For myself I can only sketch out these questions, showing that their importance is understood, leaving their solution to those better equipped and who have more direct concern with them.

B. T. McBAIN
Port Edwards, Wis.

Possible New Papermaking Territory

"Let me now plunge into the heart of my subject by calling your attention to the vast area of pine land in the southern section of this country, following that with some account of its resident resources and growing power.

"The area in mind begins at the northeast at Chesapeake Bay and stretches in a widening belt, continuous except for a strip bordering the Mississippi River, to timber line in Texas and Oklahoma and to northwestern Arkansas. Fourteen states, some of them the largest in the Union, are embraced in it wholly or in part; its outside boundary encloses over 350,000 square miles, some 230,000,000 acres. Compared with this, the spruce bearing region of Northern New England and New York is less than one-eighth as large. As I figure it, it is just about equal to the gross area in the United States and Eastern Canada south of the Arctic drainage that can be looked on as naturally or potentially spruce bearing Not at all the area of course is forest or even potential pine forest. Millions of people reside there with their cities, pastures, and cultivated areas; also much land not actually productive of pine is necessarily included. But the area in timber or available for timber is still vast indeed, figured net for pine some years ago by the Forest Service at half the gross area, or 115,000,000 acres.

"So much for that feature. For timber stands on account of the billions of feet available for sawtimber, the only basis on which the resource has ever been estimated, would have extremely little significance to you. Reference to vast areas of second growth, not possible now to estimate for area or quantity of available wood, is far more to the point. This resource, of so much natural interest to men of your outlook and training, is in that section not only in very minor degree subject to demand from local industries; very largely indeed the local population do not regard it as having commercial value or even potential utility at all.

Great Rate of Growth in South

"Even beyond that, however, in its significance to an industry such as yours, of large plant investment and enduring outlook, is the growing power there. Here we touch on a subject on which every forester who gets acquainted with the region becomes enthusiastic. With soils for the most part well suited to the rapid production of timber, particularly with a warm climate and long growing season, timber in much of this region grows at a rate not to be believed until seen by those familiar with northern territory. In the Southern pine belt, the United States is thought to possess the greatest single asset in the way of a potential source of coniferous wood and lumber that exists anywhere on the face of the earth.

"The pictures to be thrown on the screen later will bring this home in the most effective way available, but a few brief statements here will be appropriate. Three feet of yearly height growth is not uncommon among the southern pines, that to compare with half as much for white pine in New England, and a foot and less for spruce as it grows in most northern territory. Two cords per acre of wood yearly is not infrequently grown; 60 cords of rough wood at 25 years of age have been personally recorded. At 20 and 25 years of age such lands produce trees of sizes nicely suited for use as pulpwood. Some species and much soil produce at a rate of about half as great as mentioned and results actually attainable are of course affected by a great variety of factors. Men entering on long-range enterprise based on southern pine lands will do well to look carefully into such things, as soil as related to the species of timber at hand, including drainage; rate of tree growth as manifested most clearly by height on age; bush growth and undesirable species as affecting the matter of reproduction of timber.

Three Regions Adapted for Paper Industry

"To be a little more specific three regions illustrative and perhaps most attractive from the standpoint of paper manufacturing enterprise, may be covered briefly. One is Northern Alabama, a region abundantly provided with coal, also with water power in some measure; in that region are very large resources of second growth pine, one variety of the tree sufficiently low in pitch content so that its wood has been ground under present processes. That region too is very favorably situated in relation to great markets for paper.

"Second, I may refer to southern Arkansas and northern Louisiana, a region characterized by the rapid growing loblolly pine, much of it underlaid by natural gas that may be used as fuel. More than one papermaking enterprise is located in that region and others are in contemplation.

Conditions in Georgia and Florida

"Third, lying back of and tributary to the seaboard cities of Savannah and Jacksonville there is an area of some 10,000,000 acres especially attractive from the forest standpoint. Great aggregate resources of suitable wood are there; the characteristic pines are slash and long-leaf, both rapid growers, high in quality of lumber, while in respect to an additional source of revenue, naval stores, they are the most productive species known to man. Words would fail, pictures must serve, to depict conditions in that territory—the tremendous producing power, the resources available today, the enormous waste of wood that is going on, a waste that no agency is so well calculated to stop as the introduction of an industry like papermaking.

Kraft from Southern Pine

"Rounding out this division of the paper, one must refer briefly to the lines of papermaking to which southern resources are adapted. Kraft and fibre boards, as is well known, are the leading lines of product from the southern pines today, that by the sulphate process. To this process the wood is thoroughly adapted and the product of excellent quality, competing successfully with paper of the same kind from any source.

"Magazine and book paper is another line which seems to attract, the difficulty of bleaching pine fibre having, it is understood, been successfully surmounted, and most regions which furnish pine possessing also sufficient stocks of gum and other hardwoods suited to the production of the short fibre required. The fact may also be noted that intensive investigations are now going on that seem to promise much in connection with one other great line, that of newsprint paper. These technical points and some others essential to the location of successful papermaking enterprises are not authoritatively treated here. It seems, however that one might say with confidence that the era of invention and discovery in this field is not passed; consequently that wise men will be keeping close watch on developments and inaugurating enterprises as they see the opportunity at all clear, in this general direction.

Cheap Sources of Wood Supply

"Wood supply—its cheapness today, the possibility of cheaply perpetuating it—is the main topic of this year. That comes out for one thing in the present cost of pulpwood at southern paper mills, around $5 a cord on cars as I understand it, against approximately $20 a cord mill cost for many northern producers. The mere stumpage cost of New England pulpwood about equals cost of wood on cars at the south; some northern mills are paying considerably more than the same figure for freight haul. Sawmill waste and the refuse of great logging operations are now supplying a share of present requirements too, this at cost as low as or less than the other, and opportunity to obtain stock of this character will at well chosen points be long open.

Tree Cultivation

"The production of wood by design is a matter of great interest; in fact ultimately we shall have to look to it for our main reliance. Here the advantages of the South shine out in comparison with those of the present location of the paper industry. Statements already given on amount of wood that can be grown in a given time indicate that to an extent, and the following further brings out the contrast: Several years ago Canadian authorities made the statement that 20 cords of spruce wood could be raised in 40 years from planted and tended forest. The figures given could be turned around in application to much southern territory.

"Natural seeding for all the southern pines except long-leaf is abundant and easy, will serve essential purposes on most territory, given only fire control, concerning which, however, in view of conditions, especially the habits of southern country people about fire, I am bound to say there may be considerable difficulty.

Reforestation Pays in the South

"It is also true that with timber growing as rapidly as it does in the south cultural measures will pay that must be looked at askance in northern territory. This holds true of thinning, which so reduces the time required for production of usable wood; it is also true in a marked degree of artificial stocking. That measure, when successful, it is well understood, fully utilizes the ground and so spaces the trees as to secure the utmost in quantity and quality production.

"Fortunately, just at this time an enterprise is working out in the south that serves to demonstrate and test these methods. Several years ago the Great Southern Lumber Company at Bogalusa, La., a lumber concern primarily, but having a paper mill, though with many years' supply of virgin timber, set out on the project of perpetuating its busy and beautiful town on the basis of papermaking. Various conditions are favorable there, including timberlands, taxation. Selecting, therefore, a bright local man to take the lead in their reforestation work, in the last three years they have carried out the following measures: They have fenced up 30,000 acres of cut-over land to secure the utmost possible degree of protection and fire control, especially preserving by this means the bunchy and scattering tree reproduction on it; through a little regulation of their logging they saved 4,000 acres of the great longleaf mast of 1920; they have left seed trees standing over land recently cut; lastly and more directly to the present purpose they have to date planted 1,000,000 small trees, while the planting of not less than 5 million is on their 1924 program. That is going in with both feet. The project as a whole and the results to date in different directions are matters of vast interest to the whole American paper industry.

"Think in the first place what it will be if say twenty-five years from now instead of paying the prices that may then be current and hauling pulpwood hundreds of miles, as many do today, at cost of several dollars a cord, a paper mill can run a tramroad out into its own back yard as one may say, and haul in wood that it grew on its own property. Big advantage there, as all can see. What, however, of the cost of the planting operation?

Cost of Planting Operations

"There again northern men get a jolt when they learn what has actually been done at a southern locality. It takes us in New England three years one transplanting included, to raise planing stock that we think well suited to put out in the woods and the cost of the work complete runs anywhere from $10 or $12 to $20 an acre. At Bogalusa in 1922 the seed of loblolly pine was sown in March and November of the same year the beds were full of fine, stocky plants, 450,000 of them, ready to be put out in their final location. That was done with the spacing of 6x8 feet, around 900 trees to the acre, and the total cost of the work—raising plants, setting them out, fencing cost prorated, supervision and overhead not in—was little over $4 an acre. That figure is trifling in proportion to the yields in woods and value that may be looked for from successful plantations.

"Final, undoubted success is not claimed, at any rate on this occasion; some difficulties are being met and chances are involved that cannot be weighed now, for which we must make allowance. Extremely promising, however, the work must be rated at date. As noted earlier it is a thing to be given careful attention by the whole paper industry; also the men are to be congratulated and honored who lead in enterprise of this bold and constructive kind.

"That seems to tell the main story. It is an outline only, so recognized; in every phase of the subject presented extensive elaboration might well be made. In this connection it must be noted that possibilities in the way of productive forest management exist that have not even been hinted at as yet. An imperfect outline, however, if timely, stimulating and true to the facts, is often of much use, and that is all there is room for at this time.

Timber in Abundant Supply Over Wide Areas

"The South, strangely it seems, is a section little known to residents of the one in which we are. If it is a section whose possibilities wonderfully attract. Today, by reason of natural facilities and economic changes that have come about in the recent past, it is fast taking away from New England the cotton manufacturing industry that originated there, that for many years was a strong support and source of pride. The question put up in this paper is how far and how fast manufacture promises to go the same way.

"The question involves very many things and anything approaching an adequate answer has been attempted on one side only, the side of timber supply. This is a summary in that field of what has been said and of the information and study that are behind it; timber available in abundance over vast areas, at but small fraction of the cost to northern mills, much of it close to where it should be manufactured, a good portion of it as things are now going not in a way ever to produce sawtimber but going to absolute waste; opportunities for plant location and the acquisition of land wide open at low cost; timber production so easy and rapid that it looks as if, should prompt and well judged measures be taken, the cost of standing wood need never rise beyond say $2 a cord.

Causes of Color Changes in Paper

Following Mr. Cary, a paper by Martin L. Griffin was scheduled which treated of the causes of deterioration of color in pulp and paper. The text of Mr. Griffin's communication appears elsewhere in this issue of PAPER.

Mr. Griffin called attention to some interesting instances of paper discoloration. Paper made from esparto takes on a pinkish tint when exposed to aniline fumes. If rag papers are made from pulps containing residual impurities they will become discolored in course of time, while it is well known that the presence of rosin is a menace to permanent white in high grade papers.

W. A. Munro, who was formerly active on the Groundwood Committee, is now employed by the Washington Pulp and Paper Corporation at Port Angeles, Wash., and could not be present to read his paper on "Comparative Efficiency of Pulp Grinders". Copies of the paper were available and distributed to those in attendance.

Sectional Meetings

A series of sectional meetings took place in different rooms during the afternoon. The Soda Pulp Committee held forth in room 151 where papers were presented by George K. Spence and W. D. Mount. A joint session of the Technical Association and the Woodland Section was held in the Myrtle room. At this meeting J. D. Rue, of the Forest Products Laboratory, Madison Wis., continued his observations on the use of decayed wood in the manufacture of sulphite pulps.

In room 110 a session of the Heat, Light and Power Committee was held at which papers were presented on "Maintenance of Electrical Equipment" and "Prime Movers for Paper Machines," by H. L. Hayes, and F. O. White respectively.

Good Pulp from Bad Wood

In regard to the work on the utilization of decayed wood for the manufacture of pulp, Mr. Rue said that pulp for newsprint production may be made from infected wood with yields only slightly lower than those usually obtained with good wood, though the color might not be what was desired.

George K. Spence presided at the meeting of the Soda Pulp Committee and read his paper entitled "Methods in Use for Disposal of Lime Sludge and Sulphate Pulp Mills." This is reproduced on another page of this issue of PAPER.

Fifth Sitting, Thursday Morning

Sectional meetings of the Technical Association were held on Thursday forenoon during the progress of the general meeting of the American Paper and Pulp Association.

Materials and Paper Testing

In Room 151, the Materials and Paper Testing Committee met with Miss Helen U. Kiely in the chair. The chief subject of discussion with pulp testing and much interest was taken in the proceedings by an assembly that filled the room to overflowing.

Book on Standard Methods to Be Published

Miss Kiely stated that during the past year the Materials Testing Committee has assembled and had published for the first time standard methods covering the more common materials tested in the ordinary paper laboratory. She said that these methods were in all instances practical commercial methods in daily use in many laboratories. While it was realized that these might not meet with the approval of the highly scientific, it was thought better to prepare such methods as would best suit the needs of the ordinary paper mill chemist. For college laboratories or for referee analysis a more detailed method might be more advisable.

The committee will continue to assemble and check new methods during the year. It is hoped that a revised methor for pulp testing may be developed, as there seems to be a growing need for a new method that may better approximate mill working conditions.

No data seemed to be available on the testing of rags and it is also hoped that something may be worked up along this line.

If there are any particular methods which the members desire the committee to investigate they should be brought to the attention of the committee and consideration will be given them.

The meeting was then turned over to the Paper Testing Committee, Fred A. Curtis taking the chair. The annual report of the chairman was distributed in printed form and this is reproduced separately. Mr. Curtis then brought up a list of twelve questions for consideration, but no action was taken.

Sulphite Engineers Hold Sectional Meeting

At the sectional meeting conducted by the Sulphite Pulp Committee in Room 110, G. B. Genberg's paper on the Cooking of Sulphite Cellulose was presented and a further contribution from the Forest Products Laboratory on the chemistry of the sulphite process was reported. Mr. Genberg attempted to throw some light on the questions as to which country produces the best pulp and which method of cooking gives the best results. Acknowledgment for assistance in the preparation of data were made to W. G. MacNaughton, O. L. Berger and the Stebbins Engineering Manufacturing Company. The conclusions reached were that Finnish and Swedish mills cooking spruce by the Ritter-Kellner process get a lower yield of easy bleaching pulp than the Quick Cook mills in North America.

Mixtures of spruce and fir give a lower yield of both strong and easy bleaching pulp than spruce alone. Hemlock gives a lower yield than spruce for both strong and easy bleaching pulp . Mitscherlich mills get a lower yield than Quick Cook and Ritter-Kellner mills.

A simple illustration showed that where a Quick Cook mill cooking spruce uses only five digesters for a certain volume of pulp produced, six digesters must be used with hemlock to get an equal volume of pulp, nine digesters with the Ritter-Kellner process and ten with the Mitscherlich. It was noted that the steam consumption in the direct cooking process is higher than in the indirect process and that the steam consumption increases with a decrease in yield from the species of wood cut.

A Busy Corner of the Shop

One of the busiest corners on the floor of the Grand Central Palace during the week of the Second Annual Paper Industries Exposition, was that occupied by the Foreign Paper Mills, handlers of the Schopper scales and paper testers. With the Messrs. Schniewind and Voltman in charge, there was always a good sized crowd about the booth hearing the interesting demonstration of the various instruments and incidentally learning something new about paper testing.

The instruments displayed ranged from large ones for those who go deeply into the matter of paper and smaller ones for more cursory tests.

* * *

Opens New Office Here

Karl Lefren, who recently opened an office at 171 Madison Avenue, New York, as consulting engineer, is having good success. He is a member of the American Society of Mechanical Engineers and handles a wide range of work in the paper mill field, including industrial power plants, paper and board mills, general mill construction and designs.

* * *

Eagle Company Starts

The Eagle Instrument and Paper Company has recently started business in New York City. It will handle scientific paper trade instruments and paper specialties. C. J. Koenigsamen, who has long been in the business, is at the head of the company. He is perfectly familiar with paper scales having long experience in selling them.

The Eagle Company is the sole agent for F. E. Amthor's paper trade instruments. An office has been opened at 396 Broadway, New York City. A special repair department is being maintained also. Mr. Koenigsamen was with Crouse for some 20 years.

Meet Miss Kiely

MISS HELEN U. KIELY

Miss Helen U. Kiely, chairman of the Materials Testing Committee, enjoys the distinction of being the first lady member of the Technical Association of the Pulp and Paper Industry. A graduate of Smith College, she has had a considerable amount of experience in general analytical work, having been with the General Chemical Company and the Rockefeller Institute in New York.

In March, 1918, Miss Kiely joined the staff of the American Writing Paper Company, where for the last four years she has been in charge of the Paper and Materials Testing Section. In 1921 she made an extensive tour of western Europe studying paper conditions.

The many very successful educational papermaking shows conducted by the American Writing Paper Company during 1922 and 1923 were carried out under Miss Kiely's able direction. For the past three years she has been a member of the Paper Testing Committee and for two years chairman of the Materials Testing Committee of T. A. P. P. I.

* * *

Middle Mill Closed

The middle mill of the International Paper Company, situated at Glen Park, near Watertown, has been closed permanently for good reasons, according to Philip T. Dodge, president of the International Paper Company, in his annual report to stockholders last week.

The middle mill of the International Paper Company is also known of as the "C. R." mill. The "C. R." mill and the Ontario mill, the third in the group, have been running at intervals during the past two years, but the No. 4 mill has been closed since the strike two years ago.

"The development and consolidation of the water powers," Mr. Dodge states, "to give a materially greater amount of power, has been carefully planned, together with the introduction of electric generators from which surplus power may be sold."

Meetings of Affiliated Associations

SEVERAL of the manufacturers' associations affiliated more or less directly with the American Paper and Pulp Association held meetings during the week. The annual meetings of the Technical Association and the Salesmen's Association are reported separately. The Tissue, Writing and Cover Paper Associations met for the election of officers to serve during the ensuing year and the results are given below.

Officers of Tissue Association

The following officers and executive committee were elected at the annual meeting of the Tissue Paper Manufacturers' Association held Tuesday, April 8:

President, F. W. Hoefler, Oswego River Paper Mills, Phoenix, N. Y.; vice president and chairman Toilet and Towel Division, H. W. Brightman, Northern Paper Mills, Green Bay, Wis.; vice president and chairman Sheet Tissue Division, J. B. Rieg, Erving Paper Mills, Erving, Mass.; Secretary-Treasurer, E. H. Naylor, 18 East 41st Street, New York, N. Y.

Executive Committee, F. W. Hoefler, Oswego River Paper Mills, Phoenix, N. Y., chairman; H. W. Brightman, Northern Paper Mills, Green Bay, Wis.; J. B. Rieg, Erving Paper Mills, Erving, Mass.; Z. W. Ranck, Crystal Tissue Co., Middletown, Ohio.; J. M. Ross, Sauquoit Paper Co., Inc., New Hartford, N. Y.; Member of Advisory Committee of the American Paper and Pulp Association, F. W. Hoefler, Oswego River Paper Mills, Phoenix, N. Y.

Writing Paper Association

The Writing Paper Manufacturers Association elected the following officers and executive committee at the annual meeting held at the Waldorf-Astoria on Wednesday, April 9.

President, Philip Weston, Byron Weston Co., Dalton, Mass.; first vice president, W. M. Crane, Jr., Crane & Co., Inc., Dalton, Mass.; second vice president and chairman Sulphite Bond Division, A. H. Nevius, The Miami Paper Co., West Carrollton, Ohio; Secretary-treasurer, E. H. Naylor, 18 East 41st Street, New York, N. Y.

Executive Committee — chairman, Philip Weston, Byron Weston Co., Dalton, Mass.; W. M. Crane, Jr., Crane & Co., Inc., Dalton, Mass.; A. H. Nevius, The Miami Paper Co., West Carrollton, Ohio; D. K. Brown, Neenah Paper Co., Neenah, Wis.; A. H. Dwight, Hawthorne Paper Co., Kalamazoo, Mich.; E. A. Oberweiser, Whiting-Plover Paper Co., Stevens Point, Wis.; A. R. Smith, Keith Paper Co., Turners Falls, Mass.

Member of Advisory Council of American Paper and Pulp Association, Philip Weston.

Cover Paper Association

The following officers and executive committee were elected at the annual meeting of the Cover Paper Manufacturers Association held at the Waldorf-Astoria on Tuesday, April 8:

President, D. L. Quirk, Jr., Peninsular Paper Company, Ypsilanti, Mich.; vice president, B. A. Franklin, Strathmore Paper Company, Mittineague, Mass.; Secretary-Treasurer, E. H. Naylor, 18 East 41st Street, New York, N. Y.

Executive Committee—chairman, D. L. Quirk, Jr., Peninsular Paper Co., Ypsilanti, Mich.; B. A. Franklin, Strathmore Paper Co., Mittineague, Mass.; Minor M. Beckett, The Beckett Paper Company, Hamilton, Ohio.

Member of Advisory Committee of A. P. & P. A., D. L. Quirk, Jr.

Converting Paper Mills Association

Discussion of the foreign import situation as it relates to the book paper mills particularly those of the middle west, was an outstanding feature of the discussion of the Converting Paper Mills Association. This association, which for the past year has been conducting its work independently of the American Paper and Pulp Association, decided to have its statistical work handled in future by the central association.

Waxed Paper Manufacturers

The Waxed Paper Manufacturers, after two days of conferences, have formally organized an association which will have nearly 80 percent of the tonnage of that group of the industry. The new association decided to affiliate with the American Paper and Pulp Association.

Cardboard and Fancy Papers

The Cardboard and Glazed and Fancy Paper Manufacturers' Associations, whose secretarial and general association work has been handled by the American Paper and Pulp Association since the retirement of Jacob Erichsen to enter the pulp industry, decided at their meetings Wednesday, April 9, to continue their present organizations and work through the American Paper and Pulp Association. The Gummed Paper Manufacturers Association, third association handled by Mr. Erichsen, has not decided its future policy, but is considering a slightly different form of association activity.

United States Pulp Producers

A turn for the better in the American Pulp industry was reported at the meeting of the United States Pulp Producers Association, when it was found by reports from all parts of the country that the importers have injured their own market by the recent sacrifice sales of Scandinavian pulp.

Foreign pulp has been sold at prices which forced the shutting down of some domestic mills, where the paper manufacturers found they could buy plup cheaper than they could make it in their own pulp mills. The foreign manufacturers have lost so heavily by their competition for American business that they are being forced to change their marketing policy, and the results are already beginning to be felt.

The election for officers to serve during the ensuing year resulted as follows: President, D. C. Everest, Marathon Paper Mills Company, Rothschild, Wis.; vice president, L. M. Alexander, Nekoosa-Edwards Paper Company, Port Edwards, Wis.; E. W. Kiefer, Port Huron Sulphite & Paper Co., Port Huron, Mich.; W. H. Savery, Harpers Ferry Paper Co., Harpers Ferry, W. Va.

Executive Committee, Herman Elsas, Continental Paper & Bag Mills, 16 East 40th Street, New York; G. W. Sisson, Jr., Racquette River Paper Company, Potsdam, N. Y.; N. W. Wilson, Hammermill Paper Co., Erie, Pa.

Membership Committee, G. E. Crafts Crono Pulp & Paper Co., Bangor, Me.; H. W. Stokes, York Haven Paper Company, 906 Land Title Bldg., Philadelphia, Pa.

Secretary-Treasurer, Oliver M. Porter, 18 East 41st Street, New York.

Woodlands Section A. P. & P. A.

The United States consumed more paper in 1923 than in any previous year of its history, G. W. Boyce of the United States Forest Service told the Woodlands Section at its meeting on Wednesday.

"In studying the relationship of paper to the forestry problem," he said, "the Forest Service finds that in 1923 the United States consumed 8,500,000 tons of paper, of which 7,200,000 was made in this country. Of the imported paper, by far the largest quantity was newsprint imported from Canada, and the highest previous record for paper consumption was the consumption in 1922 of 8,003,000 tons."

Officers of the Woodlands Section were re-elected as follows:

Chairman, C. W. Hurtubis, Hammermill Paper Company, Erie, Pa.; vice chairman, Geo. N. Ostrander, Finch, Pruyn & Co., Inc., Glens Falls, N. Y.

Executive Committee, C. W. Hurtubis, Geo. N. Ostrander, D. E. Lauderburn, Pejepscot Paper Company, Brunswick, Me.; Edward S. Bryant, Boston, Mass.; Oliver M. Porter, ex-officio.

Secretary-Treasurer, Oliver M. Porter, 18 East 41st Street, New York.

Members at Large, E. S. Holloway, Hammermill Paper Company, Matane, P. Q.; Ellwood Wilson, Laurentide Co., Ltd., Grand Mere, P. Q.

Salesmen's Association

The Salesmen's Association of the Paper Industry met on Tuesday, April 8, and transacted a good deal of important business. Action was taken looking to more keen surveillance of paper imports, the charge being made that much foreign paper is being brought into the United States under false classification, a grade of imitation parchment or greaseproof paper, for example, being entered as wrapping and afterwards sold as parchment, so it is reported.

A resolution was adopted for transmission to the president of the American Paper and Pulp Association with the request that it be considered for adoption at the annual meeting of the parent association. The text of this resolution, which was introduced by George K. Gibson, of the Wausau Sulphate Fibre Co., is given in our report of the general meeting on another page.

The members then listened to an address by Francis H. Sisson, of the Guaranty Trust Company, New York.

Basically, business conditions throughout the country are progressing satisfactorily, but there is a tendency on the part of business interests to await tax reductions before undertaking further forward movement. The plethora of money in the banks is due in part to high taxes and the resulting disinclination of investors to let their funds move into regular investment channels. In fact, had the tax bill been passed as introduced by the Administration shortly after Congress convened, the country would probably have experienced a material increase in business and a general stimulation of industrial activity.

Unsettlement has been a feature of both security and commodity markets in recent weeks, due largely to political developments, rather than to current changes in fundamental business conditions. The action of the House in rejecting the Mellon tax revision plan and adopting an inadequate substitute has unfavorably affected business sentiment; although the restoration of the Mellon rate schedule is the revenue bill by the Senate Finance Committee was a reassuring note. Disclosures made in the course of the oil investigation have tended further to disturb confidence. The approval of the bonus bill by the House, while not unexpected, called attention to the possible enactment of the measure in some form at this session. The sharp decline in the exchange value of the French franc, until it was arrested upon the announcement of a loan to the Bank of France by a group of American bankers, was an additional disturbing element.

Cautious Business Policies

In the face of these uncertainties, a general attitude of hesitation and unwillingness to make commitments for the future continues. As a result, hand-to-mouth buying is general and programs involving the expansion of old or the undertaking of new enterprises are held in abeyance. In some industries this is more pronounced than in others but the general effect has been to restrain speculation and to lower prices somewhat. Conservatism and caution are the keynotes of the situation.

Market trends in the immediate future will probably be influenced in considerable degree by further developments at Washington, as well as by the reactions to the recommendations of the Dawes Committee concerning reparations and German financial rehabilitation.

It is obvious that the present activities of Congress must interfere in some measure with a constructive legislative program. This may not have an entirely unfavorable effect, however, for it may prevent the enactment of some laws inimical to the best interests of business, such, for instance, as legislation antagonistic to the railroads.

Outlook is Favorable

The succession of untoward developments at Washington, accompanied by the menace of further blows at public confidence, came at a time when industrial production and trade were expanding. Subsequent curtailment in the production schedules of some automobile manufacturers, together with reduced buying of steel, led to recent apprehension of a general slowing down of business. The movement of commodity prices has been uncertain, with a tendency to weakness, as is shown by the continued decline of the index of wholesale prices. And there is even more reluctant buying by distributors in many lines than prevailed heretofore. A pronounced slackening of business as a whole has not occurred, however, and the outlook remains favorable.

Money Market to Continue Easy

The fundamental soundness and strength of the banking situation as a whole is one of the greatest assets in the balance sheet of business conditions. The upturn in commercial loans in January was preceded by much the largest contraction they have undergone since their expansion began in the summer of 1922. This recession was apparently a tardy reflection in some degree of the general slowing down of business which began last spring. The expansion of commercial loans in recent weeks was not as rapid as that which took place during the corresponding period last year.

The fluctuations in the trend of secured loans have reflected in some degree the activity in the securities markets, with the peaks occurring near the quarterly settlement dates. These loans are now at approximately the level of the corresponding period last year.

Although credit requirements are now somewhat greater than a year ago, loanable funds are plentiful and interest rates have recently declined. Indications are that the money market will continue easy for the immediate future, and basic economic factors warrant a firm bond market, with perhaps an upward tendency.

The present building activity is on a large scale and the outlook for the year is very promising. As with the automobile industry, building development is favorably reflected in numerous other industries manufacturing building material and supplies.

While the housing shortage has been greatly reduced by the extraordinary activity of construction in the last ten years the end of the period of intense activity in this field is by no means yet in sight. During the past winter favorable weather conditions have served to provide a more even distribution of building operations throughout the year.

Good Volume of Traffic

Car loadings of freight have continued at a high level and indicate the active consumption of goods which is taking place. The loadings for the first several weeks of this year exceeded the corresponding total of a year ago, and later reports show a volume of traffic well above the previous figures for the winter season. A further favorable factor in the railroad situation is the fact that there is now little likelihood of adverse or disturbing legislation in Congress affecting the roads. If given freedom to develop we may expect the railroads materially to improve their credit situation during the current year.

In the cotton textile business, however, the high price of raw material, a lagging market, and a difficult labor situation have led to considerable curtailment of operations in New England and also to some extent in the South.

Manufacturers of paper and paper pulp look forward confidently to a year of active business. The production of paper in 1923 was nearly or quite of record volume, and the first of this year opened with a notable influx of orders for nearly every grade of this product.

The prevalent piece-meal buying by distributors of merchandise in general, despite the hardships which it imposes upon producers, and the selling of costs in some cases, represents a strong safeguard against losses incident to possible price fluctuations. While production conforms closely to current consumption, with inventories of business as a whole.

Meanwhile, with all the continuing irregularities, a better balance is gradually being effected between the different branches of industry. The value of last year's farm products, for example, shows an estimated increase of approximately $1,000,000,000 over the 1923 estimate, and the computed gain in average purchasing power of farm products from January, 1923, to January, 1924, was 9 per cent. Such a condition cannot fail to influence favorably the course of business as a whole.

The Outlook

When an attempt is made to forecast the future and to estimate the influences which are likely to affect commerce and industry favorably or adversely it is evident that one must ascribe a dominant place to political factors both at home and abroad. For example, in so far as the prosperity of the United States is dependent upon foreign trade it is sensitive to the significant political developments which are now taking place in Europe which may have so profound an influence upon the financial and economic situation there. There are many evidences of a definite improvement in this situation during the past year, but this improvement cannot be founded upon a firm foundation until a satisfactory solution is given to the reparations problem. If a way has at last been found for the settlement of the differences between Germany and France, and if both countries discover the real path to balanced budgets and stability of currency values, we may confidently expect to see the restoration of economic health in Europe within a comparatively short time and a corresponding favorable reaction upon the international interests of the United States.

Fortunately, conditions today seem to be more favorable than heretofore for such a settlement. And there are indications that Europe may be on the threshold of a market revival. Austria, which was apparently the most helpless insolvent, has been placed on her feet again. The economic demoralization of Germany apparently has been arrested. France has halted her unwise loan program. Italy has surprised the world by the masterly management of her finances. And the labor government has not so far disturbed the stability of Great Britain, which, by the way, reports a handsome Exchequer surplus for the second consecutive fiscal year, despite a cut in taxes last year.

Our Great Inherent Strength

Far more important, however, to the satisfactory development of trade and industry in the United States, as I have indicated, are the outstanding political problems presented by tax revision and the soldiers' bonus proposals now under consideration in Congress.

A recent estimate of the wealth of the United States places the total at the enormous figure of more than $320,000,000, or more than $2,900 per capita. This makes the United States by far the richest country in the world and constitutes it the most important world market. The task of supplying this vast domestic market alone is sufficient to occupy our own industries to a very large percentage of their capacity, thus almost assuring a constant high minimum of industrial activity. This gives us a strength of position that is in marked contrast with that of other manufacturing nations, such as Great Britain, France, Belgium and Germany, which must find a far larger proportion of their markets abroad and risk serious depession whenever such markets diminish their demand, as is the case at the present time.

This inherent strength in the economic position of the United States, as compared with other countries, has been shown by its relatively rapid recovery from the disastrous effects of the war and the postwar inflationary period. It creates an exceptional stability in trade and manufacturing which justifies a confident attitude towards the future. While it is admitted that prosperity in the United States can be materially lessened by errors of political policy, progress will still take place in spite of these obstacles. Few even in America realize the overwhelming impetus which its wealth of resources, its unexcelled facilities for transport, and the number and character of its population now give to the nation.

Thus, pessimism in regard to its future finds little justification at the present time. Only a catastrophe can check its upward and onward course and the possibility of such a catastrophe now seems remote. Experience has always shown that in the last analysis the conservative forces of the United States remain dominant. This is the year of a presidential election and coming months will no doubt be characterized by a certain hesitation in business. These influences, however, are essentially temporary in their effect and should not seriously retard the generally favorable progress of business. In fact, it is believed that the outlook for the future justified a reasonable degree of optimism on the part of trade and industry. The domestic market is very large, production and consumption are on a satisfactory scale, and the foreign situation is definitely improving. In fact, no country in the world is so soundly buttressed financially and economically as the United States today."

The election of officers to serve during the ensuing year was then taken up the following slate being presented:

For president, J. L. Fearing, International Paper Company, New York; vice president, New England District, Walter E. Perry, Chemical Paper Manufacturing Company, Holyoke, Mass.; New York District, F. N. Countiss, Martin Cantine Company, Saugerties, N. Y.; Chicago District, J. Ray Russell, Marathon Paper Mills Company, Chicago; Miami Valley District, R. T. Houk, Jr., Dayton, Ohio; Secretary-treasurer, Warren B. Bullock, New York.

PAPER MERCHANTS BANQUET

Jolliest Party of the Week Entertained by Stars from Ziegfeld's Follies—No Set Speeches

THE National Paper Trade Association of the United States closed its annual meeting with a banquet at the Waldorf Astoria on Wednesday evening, April 9, which was one of the most enjoyable ever held. It was attended by paper merchants and their guests from all parts of the country, the floor of the large ballroom being fully occupied by tables, some being placed in the rear passageways.

Best of the Series

In a week of banquets that of the National Paper Trade Association is distinguished by an absence of speechmaking. The entertainment provided for members and their guests is always of a high order of excellence and this year's assembly, the fourteenth in the series, was no exception to the rule, but rather surpassed previous performances.

All Join in Singing

During the course of an excellent dinner, served as none but Oscar can serve it, Conrad's orchestra played various selections and the jovialtiy of the gathering was manifested by all taking part in singing the choruses. Through the Ned Wayburn Office, Inc., several stars from Zeigfeld Follies had been secured to repeat their acts at the Waldorf, among them being Ann Pennington, who gave the Dimple Knee dance and received many encores. Will Morrissey acted as master of ceremonies in his own inimitable fashion and was a host in himself.

A Happy Continental Crowd

Edna Leedom and Dave Stamper gave their performance of "Trying to Get into the Follies." Dave rattled off some of his popular songs on the piano and all present tried their best to sing and whistle with him.

It was a happy contented crowd that adjourned shortly after eleven o'clock to the Astor Gallery where dancing was enjoyed until the early morning hours.

Simplification Committee

The meeting of the Simplification Committee, held Tuesday morning at the Waldorf-Astoria, was attended by a representative gathering of manufacturers, distributors and consumers. Various speakers favored getting behind the simplification program which has as one of its main features the adoption of eight basic sizes. The meeting unanimously endorsed the simplified practice recommendation as embodied in the action made at a general conference of representatives of manufacturers and users of paper which met at the Bureau of Standards in Washington on June 19, 1923. The stock sizes which are approved by Tuesday's meeting are:

General printing and publishing—26 x 29 inches; 29 x 52 inches; 25 x 38 inches; 38 x 50 inches; 32 x 44 inches; 44 x 64 inches; 35 x 45½ inches.

Book publishers—30½ x 41 inches; 41 x 61 inches.

Forms and letterheads—17 x 22 inches; 22 x 34 inches; 17 x 28 inches; 28 x 34 inches; 19 x 24 inches; 24 x 38 inches.

* * *

Consolidated Officers

Offices of the Outagamie Paper Company have been removed from Kaukauna, Wis., to Appleton and consolidated with those of the Patten Paper Company. Judson G. Rosebush recently acquired control of the Outagamie Company and the change in the business headquarters was in the interest of efficiency, making it possible to centralize operations. The business of the Outagamie Company is now being handled by the Patten Paper Company. The operating force at Kaukauna has not been changed and several clerks will remain there to take care of manufacturing details. A. C. Remley is in charge of the mill at Kaukauna.

An amendment to the articles of incorporation of the Patten Paper Company, Limited, recently was filed in the office of the secretary of state at Madison, putting that company in the million dollar class. The capital stock has been increased from $100,000 to $1,000.000. The papers bear the signature of Judson G. Rosebush, president, and Eric D. Lindberg, secretary of the company.

* * *

Fear Spring Floods

The annual spring floods are taking place along the Wisconsin River Valley and the many paper mills are on the alert to prevent damage that will interfere with operations. At Stevens Point reports tell of the river overflowing the dikes and inundating a large section of the city. Relief in the Portage Street district is said to be dependent solely on the ability of the gates in the Consolidated Water Power and Paper Company dam to carry off the river water and keep the level of the river lower than that of the slough. Thus far the big dam of the Consolidated Company has been able to cope with the situation, partially because of river conditions in the valley. Lack of rains last fall sent the river to a very low stage and the reservoirs between Wausau and Rhinelander contained only 7 per cent of capacity. In March the Valley Improvement Association of Wausau reported only 12 inches of snow north of Wausau, a condition that indicates the water may be drained off more gradually than usual.

To Build Addition

The Menominee and Marinette Paper Company, Menominee, announces plans to erect a $200,000 addition to its plant.

Pulp and Paper Men Dine

Annual Dinner of the American Paper and Pulp Association Marked by Speeches Bearing on Industrial Progress—Indexes of Production and Consumption are Indicative of Advancing Civilization According to President Barnes

THE attendance at the forty-seventh annual banquet of the American Paper and Pulp Association, held in the grand ballroom of the Waldorf-Astoria on Thursday evening, April 10, was quite up to the expectations of Secretary Baker and the Committee of Arrangements, headed by President Henry H. Stokes, assisted by G. G. Abernethy, A. Calder, L. H. Davey, Herman Elsas, A. S. Guggenheimer, C. F. Guild, W. Lloyd Heath, Roger B. Taft and G. M. Whitmore.

President Stokes Toastmaster

President Stokes was toastmaster and occupied the center place at the speakers' table where he was flanked on right and left by the chief speakers of the evening and many of the past presidents of the association. The banquet hall was festooned with flags, those of the United States and the State of New York being conspicuous. In the decorations of the tables flowers were not spared and the scene was one of great beauty. At the tables the guests found handsomely engraved menu cards in heavy covers which gave, besides the menu, the names of the speakers, officers, committees and former presidents of the association. At each plate was placed an ornamental package containing a de luxe Ever-Ready shaving set with extra blades, a gift of the manufacturers. Saratoga Geyser water was supplied ad. lib. by the Saratoga State Waters Corporation.

An Attractive Menu

The menu was up to the usual Waldorf-Astoria standard of perfection, consisting of

Cold Spring Harbor Oysters
Sorrel Soup with Toasties
Celery Olives
Aiguillette of Sole a la Bonne-femme
Potatoes, Hollandaise
Sweetbreads a la Florentine
Squab Chicken en casserole, Waldorf
Hearts of Lettuce, Russian Dressing
Bombe Villeneuve Ice Cream
Assorted Cakes Macaroons
Coffee

Mr. Barnes on Trade Indexes

In a few well chosen words, Toastmaster Stokes at 9:30 o'clock introduced Julius H. Barnes, president of the Chamber of Commerce of the United States who delivered a lengthy address on trade indexes. For more than an hour and a half he poured out a flood of statistics dealing with the progress of industry throughout the world, with special regard to the standing of the United States.

Taking individual industries he referred to the index of iron production and consumption as an indicator of industrial progress, the advance of civilization being traced in the annual record of the use of iron and its metal products. The health tables of cities and attendance figures in schools and colleges might also be considered an index of development, he said.

Indicators of Progress

The indicators of progress in the paper trade are to be found, the speaker said, in the cold statistics of industry, which are nevertheless warm with human meaning.

Mr. Barnes spoke without notes and his delivery was rapid, so that the whole speech impressed one as a great mnemonic feat. He traced the progress of America for 143 years, the following paragraphs embracing the main points of his address.

Industrial Progress in U. S.

It was of vast significance to the world, he said, that here in America 6 percent of the world's population produces annually, and converts to the manifold shapes that lend themselves to human use, practically half of the world's production of the basic materials of industry. It was of immense importance that the United States produces 43 percent of the world's coal, and consumes 42 percent; that it produces 54 percent of the world's iron, and consumes 53 percent, that it produces 64 percent of the world's steel and consumes 57; that it produces 49 percent of the world's copper, and consumes 44; that it produces 64 percent of the world's oil, and consumes 72; that it produces 52 percent of the world's timber, and consumes 51; that it produces 69 percent of the world's cotton, and consumes 37 percent.

Significance of the Statistics

But above and beyond these striking figures of the accelerated conversion of the wealth of nature into forms of use through the basic processes of industry, runs the significance of the fact that 6 percent of the world's population produces 43 percent of the world's production of print paper, and uses at home practically a half of the entire world consumption. In its last analysis, the production and consumption of newsprint in this astonishing degree by 6 percent of the world population is the greatest assurance of achieved progress in America, and holds forth the greatest promise for the expansion of world industry, year by year. American enterprise, American adaptability, American earning power, are strikingly shown in the fact that America so readily visualized the possibilities of the automobile, and so adapted it both as a widener of social contact and as a great earning contribution, that this 6 percent of the world's population produces 92 percent of the world's automobiles, and uses in its service 90 percent of the world equipment. When we add to this extraordinary record the fact that this 6 percent of the world population possesses almost half of the railroad mileage of the world, and almost three-quarters of the telegraph and telephone equipment of the world, we begin to visualize those devices which, created by ingenious and inventive minds, have been harnessed to the service of industry.

An Example of Other Nations

If, he continued, we have in America developed a new means of quick and ready transport which establishes marketing opportunity and economic independence to vast areas of production without the enormous capital investment of the earlier railroad; if we have found in this great country such use of that agency of transportation that it has created a new marvel of industry, and, by the very earning power which it itself facilitates, found a market for the unprecedented aggregate of fifteen million automobiles, then the natural question arises as to why the new and undeveloped regions of the world will not, given political and financial stability, follow America's example?

In this picture comes with peculiar promise to the paper trades the fact that, through all the ages, the permanent record by which proven experience and knowledge is transmitted to succeeding generations, has been the major reliance of the world. The paper trades of America had their recent years of trial, accentuated by the fact that war, and its aftermath, and the succeeding inconclusive peace, have checked, among Europe's three hundred million people whose living standards approach our own, the advancing living standards by which we prove the advancing standards of America. Those advancing standards rest most securely on increased knowledge and experience, which themselves base on a more general appreciation of the printed page.

The whole leadership in living standards which America holds forth as the inspiration for the rest of the world rests on the demonstrated earning power which follows certain ideals, methods, practices and philosophies that are peculiarly American.

From the very moment that highly productive industry became assured by the discovery of steam generation in 1781, America's industrial progress has been one of, first, slow, then rapid, development, of the harnessing of nature's forces to the service of industry.

Adaptation of Machine Production

This progress has clearly rested on America's adaptation of machine production, by which the power of every pair of worker's hands to create something for human use, has been steadily enlarged. The figures of power service, the figures of various kinds of power consumption, show the enormous growth of machine production. It is not alone that the average yearly consumption of coal of a century ago, of 140 thousand tons, has risen now to 575 million tons; it is not alone that in forty years the production of crude petroleum has risen from 26 million-barrels annually to 700 million barrels annually. Parallel with these most striking figures runs the story of electric light and power, which has risen in twenty years from two and one-half billion kilowatt hours per year, to fifty billion. These things mark the accelerated speed with which America's industrial methods and practices convert the basic materials of Nature into the shapes for human use, and they are the security on which rests earning and buying power.

This conversion of industry to a machine-power basis, instead of man power alone, rests primarily too on a people of developed mentality and intelligence that can direct the vast and intricate machines of productive industry. Here America is beginning to realize on its capital investment of generations of public school education. America's industry is constantly invigorated with a new and virile leadership through a social system that closes no door of opportunity through birth or accident of station, because we have no concept of social stratification. The door of opportunity swings in America for energy and ability, which of itself lends new vigor and enterprise to industry.

Now through this whole social structure, and responsive to the demands of industry which require knowledge and intelligence as never before, runs the sure assurance of undiminished demand and use for the printed page, for all it can print of accurate information and guidance. Here is a vision of enlargement for this industry which runs parallel with a justification of healthy profits which expanding industry should itself assure. So that it seems today there is a vista of promise of expansion of industrial and social reliance on the industry which prepares the sheet on which will be spread the information and knowledge which stimulates human activity and secures its earning power as well, that may well give a peculiar pride and confidence to this particular one of America's great industries.

A Trip to South America

Before introducing the next speaker, Toastmaster Stokes told of a trip which he had made to South America and how he had been impressed by the evidences left in the great capitals of that country by the Spanish and Portuguese invaders by whom civilization and the Christian religion had been introduced.

Relations of Capital and Labor

Frederick P. Fish, chairman of the National Industrial Conference Board was then introduced and talked at considerable length of the relations of capital and labor, so that it was nearly midnight before the Reverend Doctor W. Warren Giles had an opportunity to be heard. Mr. Fish said that in the United States the tremendous problem of equitable relations between employer and employee had been solved with more satisfactory results than in any other country of the world.

Dr. Giles Lets Out a Secret

In rising to speak, after a suitable introduction by Mr. Stokes, the Reverend Doctor Giles struck a sympathetic chord in the audience by saying, "I want to take you into my confidence and say that I am not a statistician so you will get home before twelve o'clock, and I will tell you that I am not a lawyer so that you may expect to get to bed before morning." He then pointed out some of the dangers with which civilization in this country was threatened and spoke of a little white book which he always carried with him, concerning which not enough was generally known by the great masses of the people and the politicians.

He Utters a Warning

Taking a pamphlet out of his pocket he waved it above his head and said the little white book he referred to was this—the Constitution of the United States. It was time, he warned, that our statesmen returned to the ways of the fathers of our country and be guided by the Constitution. The well-being and safety of our country was menaced, according to the late Pope Benedict, by five modern plagues and these were enumerated by Dr. Giles as (1) The unprecedented challenge to authority; (2) hatred between races; (3) Aversion to work; (4) Excessive thirst for pleasure; (5) Complete materialization of life.

Touches a Spiritual Note

The burden of Doctor Giles' address was an appeal to return to the spiritual outlook of the founders of our country, as in that way only could lasting success be obtained. All else was evanescent. He closed on the spiritual note of mystic meaning by telling the story of a beautiful woman who died recently in Edinburgh. In her last illness she kept reaching for a little locket suspended above her neck, and those who surrounded her dying bed felt sure that the secret of the belle of Edinburgh, who had never married despite the most advantageous offers, would be found in that locket. When the locket was opened after her death all that it contained was a little piece of paper bearing some words testifying to her love for Christ, beginning "Who having not seen I have loved."

The Reverend Doctor Giles proved a most capable successor to the former chaplain of the association, the Reverend Doctor Nehemiah Boynton, who is now in foreign parts. During the course of his short but eloquent address he was frequently interrupted by applause and at the close he was heartily cheered.

The list of guests:

James M. Abell, G. G. Abernethy, Chas. Addoms, H. A. Adler, P. Aitchison, Chester W. Alden, Lynn E. Aldrich, L. M. Alexander, Magnus W. Alexander, Judge Allen, P. M. Allen, Philip R. Allen, R. L. Allison, C. A. Alpers, Frank Amy, L. C. Anderson, Richard T. Anderson, J. A. Andrew, A. C. Andrews, Joseph Andrews, L. O. Angevine, G. Asplund, L. Astrom, Geo. H. Attfield, Edw. H. Austin.

Charles J. Babcock, P. R. Bachman, O. Bache-Wiig, Harry F. Badgley, John L. Bagg, John S. C. Bailey, G. F. Baine, C. W. Baker, Hugh P. Baker, W. E. B. Baker, H. R. Baldin, A. J. Baldwin, Arthur J. Baldwin, Charles H. Baldwin, Charles Ballin, W. F. Bancker, Julius H. Barnes, L. E. Barnes, W. J. Barnes, J. V. Baron, Nicholas J. Barrett, A. O. Barrows, N. L. Bartlett, A. C. Battersby, Philip C. THE AMERICAN PAPER AND PULP
ASSOCIATION
WALDORF-ASTORIA NEW YORK APRIL 10 1924

SCENE AT THE ANNUAL BANQUET OF THE AMERICAN PAPER AND PULP ASSOCIATION, THURSDAY EVENING, APRIL 10, 1924.

T. A. P. P. I. Has Brilliant Banquet

Judge Moore Sends Rhymed Address—Speakers Recount Progress in Science and Industry—Origin of Paper Interestingly Told by R. S. Kellogg, Who Impersonates Tsai Loun, Tutelary Deity of Papermaking

The Technical Association of the Pulp and Paper Industry moved this year to the Hotel Commodore for its annual banquet, the ninth in the series. The accommodations were all that could be desired and the menu was generally enjoyed. The absence of Judge Charles F. Moore from his familiar place as toastmaster was again noted with regret by all in attendance. His place was taken by Howard S. Taylor, president of the association, who displayed unlooked for ability as a toastmaster, discharging the pleasing functions of his position with noticeable success. After the coffee was served he announced that he had a message from Judge Moore which would be read by George E. Williamson.

Judge Moore to His Dear Techs

The Judge's message consisted of rhymed verses to his "Dear Techs," in which he made acknowledgments to the members of T. A. P. P. I. for the delightful associations of the past and touched on his present condition as the slave of illness. The verses are given in their entirety on another page of this issue of Paper. Before taking his seat Mr. Williamson made an appeal to those present to assist Judge Moore by purchasing his book "One Thing and Another," notices and order blanks of which would be found on every table.

Analyzing Industry

J. P. Jordan, president of the National Association of Cost Accountants, was then introduced by the toastmaster and made an address analyzing phases and growth of industry. He advocated the coupling up of cost accounting and executive control.

Paul T. Brady, of the Westinghouse Electric and Manufacturing Company, gave a long and instructive account of the evolution of power and pictured the possibilities of the future when the waterfalls of Niagara and other rivers were utilized to their fullest extent.

Tsai Loun and the Spirit of Papermaking

Toastmaster Taylor set the diners wondering by his next announcement, which was that an ancient Chinese document had been lately discovered dealing with the story of Tsai Loun, the inventor of paper. He said that Tsai Loun himself would appear and give a discourse on the Chinese origin of paper. Two figures attired in Chinese costumes then advanced to the piano, who were afterwards disclosed as Mr. and Mrs. Royal S. Kellogg. Mrs. Kellogg looked charming in an embroidered Chinese kimono. Announcing herself as the "Spirit of Papermaking," she played several Chinese selections and told of Chinese artistry in the efforts of the poets and painters of Cathy to get color and tone in wood, stones, etc.

The Curious Story of Tsai Loun

The musical overture finished, Mr. Kellogg took a position at the speaker's table and unrolling a lengthy Chinese scroll, recited the veracious (more or less) history of papermaking in China as developed in the story of Tsai Loun whom he impersonted.

Mr. Kellogg made a brilliant picture, attired in a flowing robe of green silk and wearing what was intended for a Chinese mandarin's cap. He added many curious details to the original story of Tsai Loun and gave the impression that this great historical character was a sort of "Wandering Jew" who still looked after the destiny of papermakers. He made him out to be one who was especially watchful over the preservation of sources of paper-making supplies, forests, etc.

Tutelary Deity of Chinese Papermakers

Tsai Loun was a celebrated man who lived in the time of the Emperor Ho-Ti about the year 100 A. D. He was held in high esteem by everyone; by his skill he invented the manufacture of paper from rags, hemp waste, fishing nets and the bark of trees. To papermakers in China he is a tutelary deity. His pagoda stands in the temple of Shue-Feng of Ta-Tong-Meng and there is always a large number of people in spring and autumn before his statue. The mortar in which Tsai-Loun pounded the fibers of the mulberry bark to make paper is still exhibited in the Imperial museum and exceptional honors are paid to this modest utensil. People and emperors have recognized in the mortar and pestle of Tsai-Loun the characteristic symbol of a new industry which was his own work. His invention placed paper at the disposal of all and he was acclaimed as a great discoverer throughout the empire. In his own country was paper used as it was in China, where everyone, poor or rich, small or great, learned to draw and to write on this medium.

Was Commissioner

Mr. Kellogg told a wonderful story of the versatility of Tsai-Loun who, among other posts under the Emperor Ho-Ti, held that of Commissioner of Agriculture. History records that Tsai-Loun was also Inspector of Trades; by his advice and with his methods, engineers and workmen made swords and various weapons with first class materials. In the first year of the reign of Yuan-Tch'ou, the Dowager Empress T'ang gave Tsai-Loun the honorary title of Marquis of Long-T'ing, for his services at the palace; the government gave him the ground-rents and products of the soil for three hundred acres.

Ends Own Life

According to one of the annals of the Chinese people Tsai-Loun did not die a natural death. Having been commanded by the Empress to invent calumnies against the grandmother of the Empress' consort, on the death of the Empress and the accession of the Emperor An-Ti, Tsai Loun was brought before the Ministry of Justice and accused of wrongdoing. He felt such shame and remorse that he poisoned himself. To this day however his name is venerated among papermakers throughout the world and Mr. Kellogg succeeded admirably by the account which he gave of his career in making his personality vivid. The story was greatly appreciated and Mr. Kellogg received many encomiums on his literary ability and of histrionic art the cheering being loud and continuous as he rolled up his scroll, gathered his robe about him and took his seat again with the party at his table.

Greetings from Canada

Edward Beck, secretary of the Canadian Pulp and Paper Association, was introduced and made a characteristic talk which kept the assembly highly entertained and vastly amused. He said that the absence of

George Carruthers who was unable to be present on account of business was much regretted. Other notable Canadian absentees who were usually to be found in attendance at the meetings of T. A. P. P. I. were R. W. Hovey who had left Iroquois Falls several days ago on his way to New York but had failed to show up.

Editor Stephenson

Joe Stephenson, an unfailing attendant at the meetings, was now in London superintending the Canadian exhibit at the British Exposition at Wembly and learning to say "My Word" and wear a monocle; while Arthur Dawe was sailing for Australia on the morrow in an effort to ascertain why Australian publishers did not buy more paper in Canada.

Dawe's Portable Typewriter

As secretary of the Canadian Pulp and Paper Association, Mr. Beck had assisted Dawe in the work of outfitting him for his trip to the Antipodes, but had been rather upset by some of the requests that had been made of him. Arthur had considerable trouble in getting all that he asked for. One day he would ask if it would be all right to take along a portable typewriter. Mr. Beck, or some other official in the association, said, yes, it would be all right "If she would pay her own expenses."

Industry Assists Government

Mr. Beck said he had been an interested attendant at the meeting of the Technical Association that morning when the subject of educating the French Canadians had been brought up. He mentioned that steps had been already taken to provide a French edition of the textbooks. The Canadian Pulp and Paper Association was active in its support of research. Recently a deputation from the association called on some government officials in Ottawa and were greeted with "Well, what do you want?" The officials were rendered speechless when told that the Canadian Pulp and Paper Association was there to offer the government a subsidy or yearly sum of money to support the work of the Forest Products Laboratory.

Mr. Beck closed an address of more than ordinary interest and retorical excellence by expressing the hope that the day would come when there would be no international lines and they would have only one industry and one technical association.

Impressions of European Mills

The last speaker of the evening was John Traquair, of the Mead Pulp and Paper Company, Chillicothe, Ohio. Mr. Traquair had just landed that morning from an ocean steamship. He has spent some time in France, Belgium, England and Scotland and gave some impressions of his trip. The industry was, he said, fairly flourishing in France and Belgium but much depressed in England and Scotland. England was now under a socialistic government and was affected injuriously by the emigration of a large number of artisans and trained workers.

Scotch Esparto Mills

He visted a number of Scotch esparto mills and commented on the fine sheet of paper they were able to produce with a furnish of 80 percent esparto and 20 percent of wood.

The feel and look-through compared very favorably with most United States papers. More attention was paid he said to specialties in British mills, quality being the first consideration rather than quantity of production.

It was a late hour before the party broke up but all were unanimous in praising the committee of arrangements for the excellent entertainment provided in the way of speechmaking and music. A professional entertainer occupied a seat at the speaker's table and at intervals he would be called upon to tell stories always of a humorous character, which he did with inimitable art and accent, so as to make the soberest member of the party unbend and risk the buttons of his waistcoat in laughter.

Those Present

The list of those who had seats at the banquet follows:

W. C. Ahlers, L. M. Alexander, Fred L. Allen, Adam E. Armstrong and guest, W. H. Artz.

J. S. Babbitt, Hugh P. Baker, W. E. Byron Baker, W. Noyes Baker, Lawrence F. Barsaloux, George D. Bearce, Edward Beck, Mrs. Edward Beck, T. A. Bennett, H. J. Berger, E. A. Bergholtz, L. M. Booth, Paul T. Brady, Thomas J. Burke, Mrs. Thomas J. Burke, John E. Burkhardt, James A. Cameron, James L. Carey, L. R. Carpenter, Emmett B. Carter, George H. Carter, M. L. Caust, A. B. Clark, Mrs. A. B. Clark, F. C. Clark and guest, Samuel Clayman, Max Cline, W. C. Clingan, Grellet N. Collins, Ward Comstock, Edward B. Cowles, Mrs. Edward B. Cowles, T. Linsey Crossley, Lester W. Crouse.

J. A. DeCew and guests, C. P. Deitrick, Richard H. DeMott, William F. Dewey, Philip DeWolf, G. W. Dodge.

George C. Emigh, C. M. Eshelman.

Herman C. Fleischer, Maurice C. Fleming, S. W. Fletcher, Mrs. S. W. Fletcher, Edward B. Fritz, Mrs. Edward B. Fritz, P. H. Glatfelter, Gilbert H. Gleason, John H. Graff and guest, John Grieve, Martin L. Griffin.

Carl S. Hamersley, H. P. Harris, Kenyon Harris, H. H. Harrison, Hugo Hartig, George H. Harvey, Raymond S. Hatch, C. H. Helvey, C. L. Higgins, H. H. Holden and guest, Harold M. Holmes, A. H. Hooker, H H. Hooker, Benjamin K. Hotchkiss, Russell C. Hughes, Edward Hutchins.

S. W. Jacobs, Frederick I. Jacoby, Irving C. Jennings, W. O. Johnson, Robert McC. Johnstone, Willis T. Jones, J. P. Jordan, Mrs. J. P. Jordan.

Harry Kay, H. O. Keay, Thomas J. Keenan, R. S. Kellogg, Mrs. R. S. Kellogg, Miss Ruth Kellogg, Miss Helen U. Kiely, T. T. Kintzing, Paul Koenig, Herman L. Kutter.

Arthur W. Lamb, Ralph W. Leeper, Frank D. Libby, H. H. Lockey, Lowell E. Longstreth.

W. G. MacNaughton, Louis W. Mahle, Clarke Marion, Julian W. Maxson, B. T McBain, Ira R. McCall, J. W. McCammon, W. S. McClellan, John McEwan, Miss Louise E. McGrath, Ogden Minton, William D. Mooney, Charles F. Moore, W. H. Millspaugh and guests.

E. H. Neese, W. S. Newell, W. A. N. Newton, A. W. Nickerson.

James E. O'Connell, James J. O'Connor.

F. W. Partsch, Mrs. F. W. Partsch, P. A. Paulson, Harold L. Peckham, O. M. Porter, Miss Helen Pritchard, R. W. Pryor, Jr., Mrs. R. W. Pryor, Jr.

R. M. Radsch, G. F. Reale, Edward O. Reed, Charles F. Rhodes, H. T. Robbins, John R. Roberts, J. O. Ross, Mrs. J. O. Ross, John D. Rue.

C. Frank Sammet, F. M. Sanger, A. Lyman Satterthwaite, Thomas H. Savery, Jr., Carl C. Schneider, H. Z. Schniewind, F. T. E. Sisson, R. Skagerberg, H. J. Skinner, A. F. Smith, Frederick L. Smith, J. J. Sokolinski, George K. Spence, George H. Spencer, W. W. Spratt, V. M. Stouck.

Howard S. Taylor, Mrs. Howard S. Taylor, E. C. Tucker.

J. M. Wade, Sigmund Wang, G. A. Ware, William J. Weed, Yuan K. Wei, H. H. Werley, W. A. Whitenack, Ralph H. Whitney, A. F. Wilcox, George E. Williamson, J. D. Williamson, R. B. Wolf, Mrs. R. B. Wolf, J. B. Woodruff.

* * *

Supers Meet In May

The Northwest Division of the Superintendents' Association will hold a convention at Marinette, Wisconsin, on Friday and Saturday, May 2nd and 3rd.

The committee has arranged a splendid program and some very interesting and instructive papers will be presented at the meeting. The program also includes an inspection of paper mills in this locality.

Lunch for members and guests will be served in the cafeteria of the Marinette & Menominee Paper Company Saturday noon, May 3rd. The wind-up will be a banquet on Saturday evening; good speakers have been obtained who will talk on live, interesting subjects and a fine musical program has been arranged. The complete program will be announced later.

Program Committee are: William Eibel, treasurer and general manager, Peshtigo Paper Company; W. W. Hinnenthal, assistant manager, Marinette & Menominee Paper Company; P. J. Lamoureaux, general superintendent, Marinette & Menominee Paper Company; P. J. Sievert, superintendent park mills, Marinette & Menominee Paper Company; J. H. Slater, manager, Escanaba Paper Company; A. G. Stone, superintendent Menominee mill, Marinette & Menominee Paper Company.

Salesmen Make Merry at Banquet

Henry A. Wise Announces Wise Plan at Annual Banquet of Salesmen—Entertainment of Merit Follows

THE long forecast and expected Wise plan to cope with the lamentable import situation was announced by its originator Henry A. Wise, long an attorney for the pulp and paper industry, at the annual convention of the Salesmen's Association atop the Waldorf-Astoria on Tuesday evening of convention week. With the topic "European Competition" he gradually led up to the plan.

Despite the fact that the plan was at least temporarily shelved by the American Paper and Pulp Association it merits publication.

In opening his address Mr. Wise reviewed the things which have made the papermaker's lot here almost intolerable. "All things being equal the United States mills should have produced all the paper used in the United States."

He further said that "imports would be of small account except for their effect on the price of the entire market," and there the attorney hit the crux of the entire matter.

Mr. Wise is a protectionist. He emphatically said so in these words: "I am a protectionist first, last and all the time. I am a protectionist, unequivocally, irrevocably." And he pointed out the need for protection for the paper industry in America.

"Only five per cent of the production causes all the rest to be sold at a loss," was one startling statement he made.

"In any other country industry would combine to destroy this competition. Here industry is constrained to live under laws which are sometimes detrimental to the vital industries of the country. The American manufacturers must not combine to destroy this competition, despite the will of the people is for protection."

Taking up the actual import situation, Mr. Wise said: "Either the tariff rate is too low or some shinanigan is going on somewhere."

He then asked the question: "Why doesn't the government protect American industry?" And he went on to answer it by telling of the work of the appraisers and calling on the paper companies for assistance for the "legitimate elimination of illegitimate European competition."

The Plan in Brief

The only effective action can be secured, he said, by "starting at the fountainhead in foreign countries and following through to the American consumers, to see that every legitimate requirement is met, to learn the actual cost of manufacture in the foreign countries, the selling price there and the export sales price."

"The cost of the organization to do this, will be insignificant," he went on to state. "As it will be a protective agency for the entire industry the plan must be adopted by the entire industry and every manufacturer should come in."

Mr. Wise asserted that under the present Tariff Act unfair methods of competition and unfair acts in the importation or sale of imported articles, which substantially injure a domestic industry, are in effect declared unlawful.

Under-valuation, improper classification and dumping of imported paper undoubtedly substantially injure the paper industry; and if it desires protection from these unlawful acts that industry must create an organization which will enable it to secure the protection to which it is entitled.

With knowledge a proper organization will be able to act immediately to prevent the unfair methods or acts which are declared to be unlawful.

It should be apparent that it is impossible for any single domestic manufacturer to maintain an organization sufficient to afford him the protection to which he is entitled; yet such protection is merely a form of insurance which every manufacturer should have.

Under the Wise plan the activities of the organization would be under the direct supervision of legal experts giving immediate attention to any problems which might arise.

An office would be maintained under the direction of a paper expert and the organization would include the necessary office help and experts in the Customs Service so that complete information would be had at all times, not only with respect to actual importations of paper but also covering foreign markets, foreign manufacturers, foreign production, foreign consumption and the paper available for importation into the United States.

At the call of President J. L. Fearing, who acted as toastmaster for the dinner, there was a rising vote of approval of the Wise plan. Practically all those present stood up, only a small minority holding their seats.

Kaltenborn Speaks

H. V. Kaltenborn, of the *Brooklyn Daily Eagle,* who has long been a speaker at paper industry affairs, spoke on "Current Events." From his vast knowledge of affairs that are large and timely Mr. Kaltenborn spoke interestingly. He took up and interpreted with an optimistic spirit the oil scandal, conservation, the reparations question and the stand of the various nations, thereon, Mussolini's success in Italy, the Dawes report. The Dawes report he called the last hope of the salvation of Europe.

Following the speaker a number of entertainers gave their acts, while throughout the evening, there was spirited singing.

The menu served was tasty and varied. Filet Mignon of Beef, a la Rose, with green pleas saute in butter was the piece de resistance while it was garnished with Cherrystone Cocktails, Turtle Soup, William Penn, Celery, Olives, Broiled Sea Trout, Hollandaise, Potatoes, Parisienne, Hearts of Romaine, French Dressing, Fancy Ice Cream, Assorted Cakes, Macaroons, Coffee, Cigars and Cigarettes.

* * *

St. Regis Man On Visit

W. F. V. Atkinson, manager of the St. Regis Paper Company of Canada at Godbout, in the county of Saguenay, Que., was a visitor in Toronto a few days ago. Mr. Atkinson stated that the St. Regis Company have extensive undertakings in progress at Godbout. A power house of 600 h. p., and 500-foot head, is being constructed and will be ready by June 1 generating hydro-electric power. Booms, piers, etc., have been built up on the Godbout River for about a mile and a half. As the pulpwood comes down through the booms it will be lifted by a jack ladder into a V-shaped flume about 7,000 feet long, into which water will be pumped. The logs, as they emerge from the flume, will travel through chutes into 14-foot draft canal steamers, which will take the product to Watertown, N. Y., for use in the company's mills across the border. About 500 feet of deep sea wharf have been constructed at Godbout. The company buys most of its wood from settlers in the district. Several thousand cords of pulpwood will be handled from Godbout during the present season and it is rumored that the St. Regis Paper Company intend putting up a 200-ton newsprint mill at Cap Rouge, Que., and that preliminary steps are now under way.

Baker Tells of Finances and Imports

Secretary Takes Up Vital Subject in Annual Report to the Paper and Pulp Association

Speaking Frankly

Secretary Hugh P. Baker, secretary of the American Paper and Pulp Association, went straight to the heart of the matters that are troubling the pulp and paper industry, in his annual report to the American Paper and Pulp Association at the Waldorf Astoria last week. No attempt was made to sidestep the issues and the discussion was free and open. It touched upon practically everything that has poked its nose above the horizon during the last 15 months.

The financing of the organization, the import problem, and the various departments of the association are all discussed in detail. The report has much of interest for every person connected with paper and pulp making.

THE year ending March 31, 1924, has been one of very definite accomplishment for the Association. This accomplishment has been both along the line of increasingly effective service to the industry but particularly in the direction of changes which promise to put the Association onto a sound financial basis for the future.

The year in the industry has been one of somewhat difficult adjustment to changing economic conditions, and yet the close of the year brings the conclusion that 1923 was pretty nearly a normal year in the industry, in fact rather more normal than any year since 1914. If economists serving the business interests of the country are correct, the paper industry like other great industries of the country, is facing a period of slowly declining prices during which competition at home and abroad will be excedingly keen probably making it necessary to do business on a narrower margin of profit. This will doubtless be a period in which the high cost mill or mine or factory will gradually find itself unable to meet competition with the low cost mill or factory.

It was emphasized in the report of the Secretary last year that if there is ever a time when a trade association should be of service to the manufacturer, it is in a period of difficult business adjustment. The past year's experience has proven this assertion in that the well organized associations have been giving more efficient service to the groups which they represent, and the less well organized associations have felt keenly the demands of their membership for greater efficiency. There is a growing appreciation in industry that a well organized trade asociation stands for definite accomplishments in the industry which it serves, and further that the trade association is in fact a part of American industry and, therefore, must play an increasingly important part in the economic development of the country.

Possibly some of the associations in the paper industry and in some other industries have concluded hastily that business conditions warrant doing certain things that are generally recognized as activities that may lead to difficulties under the law. What a legitimate association may and may not do has been very clearly established, and there is no need today for either a secretary of a trade association or the members of that association pleading ignorance of what may be done under our present anti-trust legislation.

Service by the Association

There are two forms of service given by associations in the paper industry to their members. The first and most effective form is what is called Direct Service; such as, statistical activity, holding of meetings, reports on traffic and transportation and the personal work of the secretary. The second form of service is the representation of the group which the Association serves with other groups in the industry or with other industries, the watching of helpful and harmful legislation which the Association is always in a position to work aggressively for and against, and finally the representation of the industry before the public.

American Paper and Pulp has been able to develop through closer and more harmonious work with affiliated associations, forms of very direct service to the paper industry. Some of the most important phases of this direct service are:

1—Monthly statistical summary of the paper industry.

2—Weekly statistical reports for groups not served by organized groups, or groups without a paid secretary.

3—Monthly statistical reports on imported pulp and paper.

4—Quarterly reports on pulpwood situation.

5—A printed monthly bulletin which in no sense competes with the trade papers, but rather takes the place of form letters or special mimeographed reports.

6—Reports on general economic conditions affecting the entire industry.

7—Special import service dealing with the difficult situation confronting the industry in the way of papers being imported under wrong classification and undervalued.

Emergency Service

Meeting emergency needs in the industry in the way of coal, pulpwood, casein, tariff, etc.

Meeting and Conferences

Arbitration

Assisting mills not served in this activity by affiliated associations in arbitrating difficulties between the buyer and the seller.

Indirect Service

1—Representing the industry—with other industries, with the government, and before the public.

2—Contacts of helpful character with the National Industrial Conference Board, Chamber of Commerce of the United States, Association of Wood-Using Industries, etc.

3—Contacts with foreign countries with purpose of keeping the industry informed on foreign conditions.

Committee Activities

Two years ago the policy was adopted of doing away with standing committees in the Association and their replacement by special committees to do a particular piece of work. The standing committees have been continued only as there seems to be a special work to be done during the year. This policy has proven to be a wise one, in that a standing committee that does not have regular work to do soon comes to feel that it is of little service, and that possibly if the committee is not active the Association, itself, is not active.

Probably the outstanding committee activity during the year, has been the development of an Advisory Committee from the Paper Industry for the Department of Agriculture. This committee is made up of representative men from the entire industry, whether members of the Association or not, and during February held an exceedingly intersting meeting in Washington with Secretaries Hoover and Wallace.

The principal committee activity in the industry itself has been the formation of a Committee on Perpetuation of the Paper Industry of the United States, of which Henry W. Stokes, President of the Association, is Chairman. This committee has been carrying on some exceedingly interesting work.

Woodlands Section

The Woodlands Section was organized in 1920 for the purpose of bringing together executives and their assistants having to do with woodlands. Since its organization the Section has been able to provide the industry with accurate and timely statistics as to the wood situation, and it has increased the effectiveness of these statistics by graphs and charts. The Section has as its purpose not only statistics but it is working to increase the efficiency of woods operations in the industry, to encourage the practice of forestry on timberland holdings, and to provide a medium for gathering and dissemination of information which will promote the permanency of the woods operations of the pulp and paper industry.

Wood is the raw material of a large part of the industry, and it is increasingly important that we should have information of an accurate character as to available supplies of wood, both in this country and in Canada, and how to make these supplies permanent for the industry.

O. M. Porter, Assistant Secretary of the Association, has been Secretary of the Woodlands Section and has developed this work very effectively. His report upon the work of the Section for the year appears elsewhere in this bulletin.

Information Service

This service was organized in 1921 under a special fund contributed to the Association both by members and non members. Warren B. Bullock, a trained newspaper man, was placed in charge and he has made this service of very distinct value to the industry, particularly during the past year.

The industry itself, other national industries and the public are coming to the Association as never before for information as to where various papers may be secured, how papers may be used for new purposes and many other questions. It is important that the industry should have some agency through which this information can be given out, keeping in mind, of course, always that information given is accurate and truly representative of conditions in the industry.

The limited funds assured the Association for 1923-24 makes it necessary to give up the Information Service. A Special Committee on Association Activities and Program, of which Norman W. Wilson is Chairman, has studied the activities of the Information Service fully and believes that these activities have been of great value to the entire industry. Even with the necessity of discontinuing the Information Service this Committee has recommended that the Association carry on an Information service through the regular association channels.

The Paper and Import Situation

In the report of the Secretary for the year 1922, the tendency toward a difficult competitive situation with foreign paper was referred to as follows: "Great quantities of paper are being brought into this country under improper classification and, of course, to the detriment of the paper industry. The industry should have a man who understands thoroughly the importation of paper who could keep close touch with the larger ports to see that paper is brought in under right classification, and secure information as to importations. Such work cannot be done with the present force of the Association."

In the report of the secretary for 1923 reference was again made to the need for an aggressive import service as follows: "A very important piece of work could be done for the industry by the Association having in its employ a man who understands thoroughly the importation of pulp and paper. Every time that a shipment of paper is brought into this country undervalued or wrongly classified it injures the industry. No one can estimate the amount of paper that is being brought in and wrongly classified and undervalued. The Association is keeping in as close touch as it can with customs officials at the port of New York and elsewhere and the specific cases which the customs officials of New York have brought to the attention of the Association in the past six months are clearly indicative of the very great help which could be given the entire industry if this work could be handled in a more effective way. Furthermore, such a man could keep the industry thoroughly informed as to the pulp coming into this country, how much is in warehouses, etc. The value of this information does not need to be enlarged upon —your secretary is so convinced of the necessity of service along these lines that he will continue to emphasize them in the hope that eventually such service may be given—and the wonder will be then that the service was not given before."

The Association has been keeping this import situation before its membership for more than two years not only through annual reports of the secretary but through repeated form letters and in the monthly bulletin of the Association. Your secretary has appeared before regular meetings of the larger affiliated associations to explain the situation and emphasize the necessity for action. Finally, in November, 1923, after repeated efforts to get accurate information by letter, a conference of manufacturers was called at the Waldorf-Astoria. At the Conference some 20 odd mills were represented and the situation was fully discussed and a resolution was passed urging the continuance of the work.

The difficulty all the way along has been that our manufacturers as a whole have not appreciated the emergency conditions which might arise from the constant bringing in of these foreign papers. Complaints have been so general that it has been impossible to take different cases to the government officials concerned. There has been large correspondence carried on in an attempt to get specific evidence of papers wrongly classified and undervalued but too often without success.

After a great deal of work certain cases were taken to Washington, but with little or no direct action because of the lack of evidence that such competition was actually injuring individual manufacturers within the industry.

If we are facing a period of declining prices with keener competition and lower margins of profit, there is greater necessity than ever that the Association work more aggressively in meeting this situation.

The Salesmen's Association of the Paper Industry has emphasized the situation through advertisements in the trade press and at their annual meeting just completed. Out of the agitation and work of this Association for the past two years and with the interest aroused by the work of the Salesmen's Association, it should not be necessary to continue to emphasize the necessity of action. There should be very definite action and that in a way that will meet the situation.

In presenting this situation during the past two years your Secretary has asked that the Association be given a customs expert to assist in the carrying on of the work. This same plan of action was presented before affiliated associations and at the November Conference. The situation became so difficult in January that your officers decided to temporarily give up the work of the Information Service and discontinue the monthly bulletin, and put all of Mr. Bullock's time into the import situation. Results achieved have proven the wisdom of this action. While Mr. Bullock is not a customs expert, his training as a newspaper man makes him of great value in securing needed information. As there has come necessity for technical assistance in the determination of papers, etc., he has gone to W G. MacNaughton, Secretary of the Technical Association of the Pulp and Paper Industry, a technical man who has given very valuable assistance and who is ready to continue this assistance.

Your secretary recommends that the work which the Association has been doing the past two years be strengthened at once by the addition of a customs expert. With the Association machinery already functioning and with the experience which the Association has already had, it seems that the results desired could be achieved at the expense of a single customs expert. When need arises for special legal assistance this could be financed by the groups concerned.

Income Tax Activities

In the report of your Secretary in 1922 and again in 1923, the necessity for aggressive service to the industry along income tax lines was emphasized. Last year your Secretary urged the retention by the industry of an income tax expert. This suggestion was made because of the knowledge of what other industries and other national associations are doing in meeting their income tax problems.

As in the case of the suggestion as to a customs expert, this suggestion as to an incom tax expert was not considered of vital importance to the industry. Therefore, this Association urged the Cost Association of the Paper Industry to take up income tax work as a part of its service to the industry. That Association has been giving some very helpful service along income tax lines. The Cost Association should be supported much more generously by the industry, not only for the service which it may give along income tax lines but for the help which it can give in emphasizing the necessity for satisfactory cost work in the industry.

Contact with the Federal Government

Under this heading your Secretary has discussed in his reports of 1922 and 1923 the close contact which the Association is maintaining with various agencies of the federal government.

Last year it was stated—"It is safe to assume, and many of our manufacturers will assert as the result of more or less expensive experience, that the federal government is continuing with passing years to take greater cognizance of economic conditions generally and of the individual business of paper manufacturers, and all of the other manufacturers of the country. So long as this is the case it would appear to be wisdom for the industries generally to develop more effective cooperation as between the business men of the country and the federal government. To put it another way, there are mighty few arguments against such cooperation."

Through the efforts of the Association the past four years to maintain the right contact with Washington, it is now generally appreciated among the government departments that this Association represents the industry, and when it speaks it speaks for the industry. This has been exceedingly helpful in getting the right consideration for the industry's problems at Washington.

Next Year

Your Secretary counts the past year and the year ahead better years as there comes greater opportunity for service and as he feels that the Association has made its work count for something in the up-building of the industry. As your secretary has become better acquainted with the industry and with the men making up the industry, he has come to appreciate that there are much greater opportunities for service before the Association than in the past, and he hopes that it may be possible to make these greater opportunities for service the means of protecting promoting and perpetuating the industry.

Last year in his report the secretary stated: "The fundamental need for the coming year is for a sounder and more effective method of financing this Association—If the Association is worth while it should be supported in a reasonably effective way, if it is not worth while the Association should be wiped off the slate and forgotten—The Association is worth while and three years of service with you has made me believe tremendously in the industry, in you men who make up the industry and in the Association itself."

The chronic financial difficulties of the Association finally came to a head in the early winter, just past, and your President, Mr. Stokes, took hold of the financial problem in a way that means a better Association.

Early last December the President appointed two Special Committees, one on Finance, of which W. J. Raybold is Chairman and the other on Association Activities and Program, of which Norman W. Wilson is chairman. Owing to the fact that there was a deficit when your secretary came into the Association in 1920 and the fact that most of his service with the Association has been during a period of business depression, it has made it excedingly difficult to meet the increasing demands for service and at the same time get the Association onto a sound financial condition.

You will hear today that Mr. Raybold's Special Committee, with the aggressive assisance of Mr. Stokes and Norman W. Wilson, and in fact of every member of the Association, has been able to raise funds sufficient to put the Association square with the world. This seemed like an impossible task when it was approached in December, 1923, but hard work has accomplished the seemingly impossible task and the Associatoin opened this fiscal year on April 1 without deficit or financial obligation of any kind.

Another phase of the difficult financial situation was the irregular and uncertain method of financing the Association. The report of the Special Committee on Association Activities and Program, which will be presented today by its Chairman, Norman W. Wilson, will indicate the thorough study which this Committee has made of the Association's problems and the solution proposed by that Committee, if accepted by you, will put the Association onto a sound financial basis. In fact the acceptance of this report means a turning point in the life of the Association of very great importance. With direct financial support by the individual mills and, therefore, direct financial responsibility for the Association, we should be able to go forward not only on a sounder financial basis, but on the basis of sounder and more effective service.

The fundamental need for the year 1924-25 in the work of the Association is for a better personal contact between the working force of the Association and its membership. Four years of effort to develop more direct service has gradually brought the secretary and his assistant into closer contact with the manufacturers. This contact should be carried still further, for only as there is a real working contact between the staff and the manufacturers can the Association know accurately the need of the industry and meet those needs as members of the Association feel that they should be met.

Limited funds may prevent the staff from spending as much time in the field as they should spend. The luncheons held in the different papermaking sections last year were very helpful and in the long run are less expensive than it would be for the secretary to spend enough time in any given section to meet the executives who would attend a luncheon in a group. These luncheons should be continued, that there may be discussion of the vital problems in the industry rather more than the problems of the Association.

There are other needs to be met in the work of the Association, but now that the financial burden has been lifted from the Association it should be possible for the Association staff to be more effective in all of their work.

Your Secretary appreciates more than he can express the solution of the final problem of the Association, which has been carried through by President Stokes and Vice-President Wilson. It has been a privilege to work with these men during the past year. Few members of the Association appreciate the time and thought demanded of the officers of the Association. Mr. Stokes and Mr. Wilson particularly have met all of the demands of the Association in a fine, generous spirit that has meant everything to those who are carrying forward the work of your Association here in New York.

The Association, after all, like any organization of men, is what the members make it. Your officers can but assist, and to repeat what has been said in previous reports "How much that assistance (from the officers) will mean to the Association will depend largely upon the way in which you meet, not only the Secretary, but your President and your Executive Committee in the work which they are trying to do for you."

* * *

Seaman Company Moves

On April 19th the Seaman Paper Company of 208 South LaSalle street are moving their general offices to the 10th floor of the new Wrigley Building.

Starting in 1902 as a small paper house, the Seaman Paper Company has grown steadily during the last twenty-two years, until today it enjoys a position second to none in the manufacture and distributon of all grades of paper throughout the entire United States.

In Chicago they have a seven-story concrete warehouse located at 411-23 W. Ontario street, carrying probably the largest stocks of book and other papers in that city.

The new phone number will be State 2100.

The officers and directors of the company are: George M. Seaman, President; A. J. McKay, Vice President and Assistant to the President; J. B. Seaman, Vice President, (New York); D. R. Seaman, Vice President; George D. Jones, Vice President; C. W. Sherman, Treasurer; F. A. Borchers, Vice President and Secretary; F. M. Stephens, Vice President and Sales Manager; J. Poole, Vice President and Assistant Treasurer.

* * *

Elect Officers

In a regular meeting of the Wrapping Paper Association of Chicago held on the evening of April 10th the following officers were elected for the ensuing year:

Jas. S. Danehy, Schwarz Paper Company, president; John Daily, Daily Brothers, 1st vice-president; Leo Altholz, Inslander-Steindler Paper Company, 2nd vice-president; Peter O'Leary, Rauth Brothers, secretary; William Ensweiler, Pomeroy Paper Products Company, treasurer; E. H. Allen, Allen, Ward, Myers and Schwartz, assistant secretary.

Notes of New York Trade

Schedules in bankruptcy have been filled by the Bauer Paper Box Company, Inc., of 440 Lafayette Street, New York. Liabilities are placed at $21,071, and assets at $27,700, main items of which are fixtures and stock $16,000, and accounts $8,500. The principal creditors are the Yorkville Bank, $6,500; John F. Boyle Company, board dealers, $2,269; Marwin L. Smith, $1,727, and Earle E. Cort, $1,613.

* * *

Stuart Henry was appointed equity receiver for the Manitou Paper Company, dealers in wall paper at Broadway and Fifty-seventh Street, New York, on April 7 by Judge Learned Hand in an action filed by M. Francis Hunt, who asserted a claim for $5,000 was not paid. Liabilities are estimated at $71,672, and assets, consisting of paper, real estate, machinery and accounts, at $126,000. The receiver's bond was placed at $25,000.

* * *

An event of Paper Week in New York was a dinner and entertainment given by Albert T. Hicks, Walter R. Hicks and Leonard F. Hicks, of Daniel M. Hicks, Inc., importers of and dealers in paper mill supplies of 200 Fifth Avenue, New York, to a group of their paper mill friends who were in this city for the convention and exposition. The "evening" took place in a private parlor of the Pennsylvania Hotel on April 9, and following the serving of dinner a fine vaudeville program was staged.

* * *

The plant of the Lion Supply Corporation, dealers in waste paper and papermaking rags at 931 Courtland Avenue, New York, was badly damaged by fire early on the morning of April 10.

* * *

Among the visitors in New York during Convention Week was George A. Just, president of the Graphic Arts Exposition to be held in Milwaukee, Wis., this summer, Mr. Just coming to the convention with the paper delegation from the Wisconsin city. He reported that plans for the exposition were progressing rapidly and that Milwaukee is striving to make the event a great success.

* * *

The Lappert Trading Company dealers in papermakers' supplies, has moved from 132 Nassau Street to the National Bank Building, 1819 Broadway, New York.

* * *

The firm of S. J. Fisher, Inc., dealers in paper manufacturers' supplies and specializing in old rope and bagging, is planning to move to larger quarters on May 1 at 263 Front Street, New York. The concern is now located at 309 Water Street, New York.

* * *

According to predictions made in the financial district of New York this week, a plan calling for the reorganization of the American Writing Paper Company will soon be submitted to stockholders of the company. Engineers are working on an appraisal of the property, and the completion of this work is expected to hasten the formulation of a plan.

* * *

A new record of attendance was set at the sixteenth annual banquet in the East Ball Room of the Hotel Commodore, New York, on the evening of April 9 of the Waste Merchants' Association of New York, whose membership comprises practically all of the large dealers, packers and brokers in papermakers' supplies of Greater New York. The 225 members and guests present included quite a few paper and board mill men, who were the guests of the stock dealers. During the serving of a sumptuous dinner a jazz orchestra provided lots of music, and the diners joined in singing many of the popular songs between courses. After dinner a splendid vaudeville show was put on, the performance taking place on a stage erected in the center of the dining room, and the tables being so arranged as to give everyone a direct view of the stage. The cabaret troupe from the Rockwell Terrace Restaurant in Brooklyn, which included vocalists, dancers and a beauty chorus of eight young ladies cavorted on the stage and sang and danced for about two hours. The banquet committee consisted of Walter R. Martens, of George W. Millar & Company, Inc., Alfred J. Moran of the Alfred J. Moran Company and Charles Passanante of the Wilson Paper Stock Company.

With Marr-McDonnell Co.

The Marr-McDonnell Co., of Mt. Holly Springs, Pa., manufacturers of bond, ledgers and special papers of rag content, who have been quietly building a reputation on high grade papers during the past two years, are sending out to the trade, notices that Byron Weston and Bruce Babcock have become affiliated with the company's interests and will provide the desired personal element, necessary to properly care for the firms' rapidly increasing business.

Mr. Weston comes from the well known Weston family, papermakers, of Dalton, Mass., his grandfather being the original Byron Weston, and his father the late Franklin Weston. Mr. Weston possesses the necessary resuirements to make a complete success in his new connection and already is very favorably known in the trade.

Mr. Babcock needs no introduction to the paper trade, having served the industry in various capacities since 1894 and his well rounded experience will be of great assistance to the Marr-McDonnell Co., whose progress is already being favorably noted by the trade.

* * *

Future For Oregon

The United States geological survey recently reported that the water powers of western Oregon will soon be in as much demand as those of California are today, with the rapid increase in the use of such power and the improvement of long distance electric transmission.

The report dealt specifically with the power possibilities of the Smith, Trask and Nestucca rivers, which are within easy transmission distance of Portland, Oregon.

The total potential power with regulated flow on the three rivers amounts to 21,600 horsepower for 90 per cent of the time and 47,700 horsepowerfor 50 per cent of the time.

The total estimated water power of the United States is 54,000,000 horsepower. Oregon has 6,615,000 horse power or more than one-ninth of this water power. This water power greatly reduces the expenses of manufacturing industries located in the state.

* * *

Plan An Association

At a meeting in Montreal a few days ago of the pulpwood dealers of the Eastern provinces, pulpwood merchants from four provinces took preliminary steps to form a Canadian-wide pulpwood dealers association to protect their trade and insure general Dominion-wide co-operation in all movements aiming at forest protection and improved operating methods. The action of the meeting resulted in the formation of an organization to be known as the Canadian Pulpwood Association. Angus McLean was elected president pro tem and Ralph P. Bell, vice-president and secretary, pro tem. Later on these officers met members of the Quebec Pulpwood Dealers' Association, when it was decided to retain that organization and to co-operate with the Dominion Association.

Papermaking Opportunities in the South

Availability of Raw Material, Power, Markets, Labor and Climate Point to Early Development of the Paper Industry on a Big Scale

By CHARLES A. McKEAND

General Industrial Agent, Seaboard Airline Railway

THE object of the Seaboard Air Line Railway exhibit at the second annual Paper Industries Exposition is to present to those interested in the development of pulp and paper industry, the opportunities to be found in the South for further expansion of the industry.

It would be useless for me to go into a technical discussion of the manufacturing of paper from variuos types of Southern timbers. You are all aware that during the past few years there have been many successful mills launched in the various southern states engaged in the manufacture of kraft papers. You are no doubt aware of the development carried on by the Forest Products Laboratory at Madison, Wis., and by individual paper engineers and chemists for the development of magazine book paper, cardboard, wall board and other types too numerous to mention.

Paper Made From Pine

In our exhibit here we have on display samples of book paper made from a combination of pine and gum and the pulp panel which we have for distribution embraces the processes used in the production of this pulp. It is therefore useless for me to go into an explanation of the processes. I wish rather on this occasion to present to you the broad features of the South from a manufacturing standpoint. In doing so I wish to discuss the following fundamentals: (1) the availability of raw material; (2) power; (3) markets; (4) labor; (5) climate.

As to materials there are twenty-six places located at various points on our rails offering pulp material in sufficient quantities for the location of a pulp and paper mill. By sufficient quantities I am speaking in millions of of cords. I have picked places where there is in sight at least ten million cords contingent to these points figuring future supply.

The average growth of pine in the six states traversed by the Seaboard, namely, Virginia, North and South Carolina, Georgia, Alabama, and Florida, is such that timber will regrow to a pulp size in twenty years. I mean by pulp size those from six inches in diameter up. The manager of the pulp mill at Hartsville, S. C., stated that from a timber tract close to their mill on which an intelligent logging process had been in vogue, his company had taken an average of ten cords an acre, three times in fitfeen years. Almost any of the cut-over pine lands of the Southern states over which lumbering operations have been conducted, offer unlimited possibilities for the regrowth of pine pulp supply. The low marshy lands of our coastal rivers afford a plentiful supply of rapidly growing gum wood and on the hillsides and in the river valleys of the Southern states are found various other types of hard and soft woods suitable for various phases of the industry.

Endless Source of Pulp Supply

Not only will our timbers in the South reproduce more rapidly than in other regions of the United States, thus eliminating the necessity of a mill organization carrying a large timber reserve, but the farms of the South will be found a never ending source of pulp supply; practically every farm in our territory being largely timbered and the farmer will be glad to avail himself of the opportunity during the winter months to cut and deliver to the mill cord wood receiving a cash payment, which will add greatly to his farm income and help him in carrying on a well balanced farming enterprise.

Practically all the smaller mills now existing in the South secure their entire pulp supply in this manner and they have never experienced a lack of a plentiful supply.

Not only does our timber grow rapidly but the yield per cord for the various types of Southern woods is greater than that of Northern woods.

In addition to the plentiful and continuous supply of pulpwood the South offers other materials for use in the pulp and paper industry, such as kaolin and rosin sizing. The kaolin mines of Georgia are among the finest in the world and a great many of you gentlemen present are thoroughly familiar with the clays produced in these mines. We have on exhibit at our booth samples of clay from the famous Dry Branch District of Georgia, the samples having been furnished us by Moore & Munger, operators of these mines.

The naval stores industry of the South produces your rosin sizing. An intelligent turpentining operation on growing pulpwood will increase the revenue per acre of your timber holdings and give you an adequate and profitable crop in rosin, turpentine and rosin sizing. At the completion of such operation, you still have available the original wood for pulp supply.

Power

The second item of importance in this industry is that of power. The South has assumed the leadership during the past few years in the development of her waterpower resources. The streams of the Southern states have a potential seven million H. P. of which only 1,500,000 has been developed. Through a plan of interconnection, the various power companies have formed a super power zone, making it possible to transmit power through these connections from one section of the South to another, thus affording us a quantity of power unequalled in the United States. For heavy load machinery such as is required in the pulp industry, the Southern hydro-electric power offers attractive inducement. At those places out of the power zone but suitable for the location of a mill, because of the accessibility of raw materials, we have through our various Southern ports splendid service for the delivery of fuel oil. The coal fields of Kentucky, West Virginia, Tennessee and Alabama offer an unlimited and un-ending supply of coal for industrial purposes, produced at a figure delivered at the mill which is indeed attractive to the industries. You know that coal delivered at $5.50 to $6.00 a ton is very attratcive in comparison to coal delivered for $10.00 to $$12.00 a ton as in the North.

Markets

You who are keen students of the market problems are fully aware of the movement westward of the purchasing population of this country. Points in the South are closer to the great purchasing centers of the Middle West through the Ohio and Mississippi gateways than are the hills of New England and Canada, and at the same time it is a shorter haul to the Northern markets of the East from various Southern points than it is from the mills of Michigan and Wisconsin.

An item in connection with this is the fact that the rail delivery to the central purchasing sections from Southern points would be those from the East, thus assuring more over rail lines less congested with traffic than those from the East, thus assuring more prompt and efficient delivery at less cost.

The great ports of the South Atlantic and Gulf make possible the shipping coastwise by water of the product of our mill, or the shipping by water to the Pacific coast, thus affording you a decided advantage over the mills located in the East and North, that use a long rail haul.

In addition to the transportation facilities for delivery of your product to the markets of the central East and North, I call your attention to the fact that the purchasing power of the South itself has increased 40 percent in the past ten years and if the curve projected into the future reads aright, the South will see a 100 percent increase in its purchasing power in the next ten years.

Labor

In discussing labor, I am discussing the South's greatest assets. There has grown up an erroneous impression among the Northern people as to our Southern labor. I wish to call your attention to two classes of labor which we have, both of which is especially attractive to your type of industry. First is the white labor, all of which is native born Anglo Saxon, possessing a high degree of native intelligence, true to American principles which predominated this country fifty years ago, and a class of labor which will give you high production and an honest day's work for its wages and be loyal to the organization for which it is working.

In the South a man, such as I have been describing above, gives you two weeks' notice when he is going to quit and if you wish to discontinue his services you give him notice. Compare this, if you please, with the sudden determination on the part of the highly unionized radical type of labor in your Northern mill which decides to lay its tools down and quit without notice.

The labor such as I have been describing works fifty-five hour week in the Southern states. The other class of labor in the South which is attractive for an industry of your type is the negro labor, which would be used in the logging operations and the heavy manual work around your mill. This type of labor under the direction of a man who knows how to handle them will give you good results. I have seen a man from the sunny shores of Italy in a wood yard in New York pulp mill take longer to do a given job than I ever saw a negro in a Southern mill. I think those present representing Southern mills will bear me out in the statement that they have on the whole found this type of labor satisfactory.

Climate

Climate is the fifth fundamental necessary to your industry which offers an attractive Southern inducement, a climatic condition which makes it possible to work the year round. A climatic condition which eliminates the necessity of spending, as in northern and Canadian mills, forty to fifty percent of your coal bill for heating purposes in the winter. A climate which eliminates the necessity of erecting expensive buildings.

White Water Economy

New Process of Saving Fibers That Would Otherwise Be Lost—Chemical Coagulation and Sedimentation by the Boothal Process

By **L. M. BOOTH**

Booth Chemical Company
Elizabeth, N. J.

WHITE WATER Economy, What is it? The answer expressed in terms of "the truth, the whole truth, and nothing but the truth" is—"use it all."

By many experienced papermakers this scheme is considered an idle dream or a fond hope. On the other hand there are a number of mills where this procedure has been adopted following a diligent search for possible objections to such a plan.

Stock Lost in White Water

Stated in the simplest terms, the manufacture of paper consists in the separation of solids from the liquid portion of a water suspension of the stock. In common with all processes, perfection has not yet been attained, so that as practised on the familiar fourdrinier or on the cylinder machine, the separation is incomplete. The water which passes through the wire carries with it some of the stock, hence white water is produced.

The long continued presence of the stock in the white water has an unfavorable influence on each of the components, in that the stock decomposes and in so doing, contaminates the water with the products of decomposition. It is therefore under certain conditions unfit for reuse.

Supplemental Process

Since it is apparent that 100 percent efficiency in stock and water separation is not attainable by the paper machine alone, a supplemental process must be sought as a means of further separation.

White water usually carries from 0.83 to 8.3 lb. of stock per 1,000 U. S. gallons, equivalent to 0.01 percent to 0.10 percent consistency. It is unnecessary to conduct extensive research to develop a radically new process, or to experiment with untried principles in order to solve the problem, because white water responds to the same general class of treatment that for years has been the standard method of water purification for municipalities, paper mills, etc., namely coagulation by chemicals, followed by sedimentation.

Simple Sedimentation Inefficient

In many mills, it is the practice to settle by plain sedimentation, such of the stock as separates most readily, and to use this back in the process. This still leaves a relatively large volume of low consistency white water which must be promptly separated into its constituents, stock and water in order to use these to the best advantage.

Fortunately the separation of the stock and water is easily and effectively accomplished by chemical coagulation and sedimentation. According to authoritative works on water purification, the ancient Chinese utilized aluminum hydroxide precipitates for clearing water of suspended matter. This uses antedates the birth of Fourdrinier by thousands of years. It is thus apparent that man knew the principles of handling the white water, long before he had a paper machine with which to produce white water.

An Old Process Modernized

The ancient basic idea has been brought up to date, including the adoption of means particularly adapted papermaking needs. Use is made of a balanced, and complete coagulant whose constituents mutually react. The product of this reaction, aluminum hydroxide, entraps the fiber and other suspended matter so that these may readily settle and be separated from the water in a suitable settling tank.

Boothal Coagulation Process

Besides settling the stock, a freshly made precipitate of aluminum hydroxide has the effect of coagulating colloidal substances such as clay or resin which may thereupon be promptly returned to the paper machine. Because of the speed of handling, there is no opportunity for slime producing decomposition to occur. In some mills using the Boothal coagulation process, cleaner paper is being made than formerly as a consequence of the substitution of clarified white water for the regular mill supply of fresh water for beaters and showers.

Saves Both Pulp and Water

The present state of the art of separation of pulp and water and their utilization in the manufacture of various grades of paper from tissue to boxboard is such that all of the stock furnished to the beaters may be delivered in the form of finished paper. Another important advantage is that by the utilization of the clarified water for showers, etc., it is possible for many mills to increase production without developing additional fresh water supplies. Some manufacturers are confronted with vexing stream pollution regulations. These have no terror for, and are automatically complied with by, those who have found that it is cheaper to save and use both constituents of white paper, pulp and water, than to cling to conservation methods of yielding less than 100 percent efficiency.

The only "save-all" that *saves all* is the system which *uses all.*

ALBANY COMPANY TO HAVE CANADIAN MILL

A. P. W. Paper Company To Have Mill in Canada to Furnish Pulp To American Mills

THE contract for the erection of the buildings at Sheet Harbor for the Albany Perforated Wrapping Paper Company of Albany, N. Y., has been awarded to the Parsons-Ed Company, of Moncton, N. B.

The A. P. W. Paper Company have been operating three mills in New York state for a number of years. Some time ago, the company sent representatives to eastern Canada to select a site for a pulp mill that would supply pulp for the company's United States mills. After some deliberation, it was decided to purchase the property of the Sheet Harbor Lumber Company which included vast tracts of pulpwood lands, and property fronting on the Atlantic Ocean. A lumber mill and a rossing mill that had been operated by the former owner, was also included in the transaction. During the past winter, preparations were made for the building of the pulp mill.

The main building will be 175 feet in length, and eighty feet in width. It will be of reinforced concrete and brick. The contract to the Parsons-Ed Company also includes the installation of the equipment including the grinding and barking systems. The mill is to be ready for operation early in 1925. The power will be supplied by the St. Margaret's Bay hydro-electric station, an agreement having already been effected whereby the company secures the electric current at a very cheap rate.

In addition to the pulp mill, there will be erected at Sheet Harbor, shipping piers on the water front. From these piers the bulk of the pulp manufactured at the mill will be shipped to the New York state mills. The piers will accommodate steam and sailing craft. On the piers will be constructed warehouses. Other buildings to be erected will include cottages for the employees, but a start on this construction will not be made until about midsummer. The mill will be started this month, the excavation for the foundation having been completed. A special incentive has been offered for the completion of the work either late this year or early next year. The firm of builders having the contract in charge have built a number of important buildings in eastern Canada, but this is the first pulp or paper mill that will have been undertaken by the firm. The A. P. W. Paper Company has several representatives at Sheet Harbor supervising arrangements for the construction work, including R. K. Jones as manager.

Asbestos Dryer Felt Introduced

A New Product By H. N. Hill Being Introduced in the Paper Industry

THE Asbestos Dryer Felt has been perfected to meet the needs of the Paper Industry for a Dryer Felt that would have long life, dry paper more uniformly, and be free from stretching and buckling.

The life of Dryer Felt is limited by certain destroying influences: 1st, the heat of the Drying Cylinders burns the life out of the fibres; 2nd, the felts suffer decomposition due to always running in a moist state; and, besides, one must not overlook the strong pull which finally causes them to tear.

It is evident that a felt composed of a material not attacked by heat and decomposition must have a very long life. Asbestos is such a material, but since it has little strength it much be combined with a texture resistant to pull. The Asbestos Dryer Felt has an asbestos face and a backing of hard twisted, loosely woven cotton yarn. The cotton cloth takes up the pull, and is protected by the insulating asbestos layer from the heat of the Cylinder.

The chief advantage concerning its duration is that the asbestos is not attacked by heat, and therefore the felt is exposed to very little wear.

Canvas Felts suffer most in the middle because the heat of the Cylinder is greatest there, and the Felt is cooled by the air on the edges, consequently they wear out first in the middle and after a certain time the cloth lengthens, forms buckles, and finally folds. The thinner the felt, the more it will fold. Asbestos Dryer Felts are too thick their nature. Besides, the Asbestos Dryer Felt is not attacked by heat and therefore will not lengthen.

Asbestos Dryer Felts are made only in one weight, which is much thicker and heavier than the Canvas Felts used here. This thickness is one of the chief advantages of this Felt. It forms a strong backing for the asbestos, eliminates any tendency to buckle or stretch, and holds the paper tightly against the Cylinders, making a more uniformly dryed sheet.

Asbestos is a very flexible material, which, when moist, becomes smooth and forms a uniform surface. It absorbs water very easily and gives it up again very readily, therefore it dries very quickly. The Dryer Felts become moist, as it is well known, and must be dried again on the Felt Dryer. This moisture is due not so much to actual absorption as to the condensation of the steam in the felt. The Asbestos Dryer Felts are loosely woven so they will pass the steam readily and dry quickly.

The upper surface of the Asbestos Dryer Felt is dressed in such a way that it does not close the pores of the fibre, but the fibres are smoothed so that they have a strong affinity for water and dry the paper well.

Surprisingly long runs have been obtained in Europe, but it is difficult to make a comparison between runs made there and what may be expected here, because they use almost exclusively a heavy *Woolen Felt* that has much longer life than Canvas Felts used here. Woolen Felts have a normal life of about 12 to 18 months, and in exceptional cases from five to six years. The Asbestos Dryer Felts are giving from 50 to 100 per cent. more service than the Woolen Felts, so they presumably should have a life many times longer than Canvas Felts.

The life of felts vary so greatly, even in mills making similar grades of paper, due to various conditions, that results obtained in one mill hardly would be a guide to what might be expected in another mill.

The principle of Asbestos Dryer Felt is correct, and it has been perfected after years of experiment, so that it is actually being used by hundreds of paper mills making practically every grade of paper, from high grade tissue to news and at speeds up to 700 feet per minute.

The Asbestos Dryer Felts are supplied endless, or with ends woven in three tissue layers which are interleaved and sewed together, making a smooth, strong joint.

This is a very simple operation and is unquestionably the most satisfactory way to put on a Dryer Felt.

Measuring

In measuring the Dryers for an endless felt, enough slack should be allowed to get the last roll in place without bringing undue strain on the Felt. The Dryer should be measured with a steel tape or the old Dryer Felt measured from seam to seam.

Top Dryer Felt

All of the Felt rolls must be taken out. The Felt should then be stretched out over the tops of the Dryers. When this is done, the rolls carrying the upper part of the Felt should be put in place by slipping the rolls in between the top and bottom layers of Felt and placing them in their respective brackets. The top part of the Felt, now being held up by the Felt Carrying Rolls, it is an easy matter to press the Felt down between the Dryers and insert the rolls to hold it in place. The Felt can then be tightened up to an easy tension and is ready to run.

Bottom Dryer Felt

All Felt Carrying Rolls must be taken out. The Felt should then be stretched or rolled out under the Dryers. If there is a pit under the Dryers, enough of the Bottom Felt Carrying Rolls should be put in place to keep the upper part of the Felt suspended above the pit. If there is no pit under the Dryers, the bottom Felt rolls should be inserted under the Felt and the Felt pulled up between the Dryers. The Felt Carrying Roll can now be placed under the Dryers, hoisted up and placed in the brackets. This must be repeated for each Felt Carrying Roll between the Dryers. When the rolls are too heavy to be raised up by hand a light chain hoist or rope tackle should be used for hoisting them into place. The bottom roll should be put in last, leaving the most accessible roll, in both top and bottom, Felt until the last one to be put back into place. All Felt rolls should be examined for loose or defective journals before being put back into their respective places.

* * *

Increases Earnings

The Belgo-Canadian Paper Company has been able to increase its earnings since the last of its new paper machines was brought into operation, and it is understood that they are now running at the rate of about 15 per cent on the common shares. This is equivalent to about five and one-half times preferred stock dividends. With its new machines Belgo has a capacity of about 115,000 tons of newsprint a year and is now a nicely rounded-out newsprint producing company.

AMERICAN MILLS NOT TO GO TO CANADA

Paper Manufacturers of the United States Emphatic in their Declaration

IN a memorandum submitted to the Canadian Pulp Wood Commission, pulp and paper manufacturers of the United States interested in the supply of wood from Canada have let it be known that there is very little likelihood of American pulp and paper plants being quickly transferred to Canada through the placing of an embargo on exports of pulpwood. The moving of such plants, it is pointed out, would either involve the scrapping of large investments in the United States, or the duplicating of a part of them in Canada. It is also contended that instead of moving their plants to Canada, American mills would either seek to develop new supplies at home or in Scandinavian countries.

The memorandum also disposes of some very erroneous conclusions as to what may through legislation, be done to remove pulp and paper plants from one country to another. It says: "Pulp and paper mills will be established in the United Sattes and Canada wherever proper sites can be found and proper conditions exist, but the growth of this industry will be the resut of economic laws, not the result of statute laws."

In a summary of the evidence heard by the Commission it is pointed out that for the Dominion as a whole about 90 per cent of the forest area is publicly owned or Crown land; while in the province of Quebec, from which most of the exports of pulpwood go to the United States, 94 per cent of the forest area is held by the Crown. Since in practically all of the provinces the export of wood cut on Crown lands is prohibited, it is pointed out that an embargo would effect less than 10 per cent of the whole forest era, and that the wood now being exported is only from lands held by farmers and settlers, or from lands held in freehold by manufacturers in the United States, or from leases which have been granted by owners in Canada to manufacturers in the United States."

Referring to exports, it is pointed out that the proposed embargo would effect only 1.7 per cent of the total lumber cut, if farmers' and settlers' lands were exempted, as provided by the order-in-council passed last year. Furthermore, considering the fact that this order-in-council exempts from operation of any embargo all contracts made prior to June 15th, 1923, and than for a period of 10 years, the actual percentage of the total wood cut the embargo would apply to, would actually be 1 per cent or less, of the total cut, or somewhere between 100,000 and 150,000 cords per year.

* * *

A. W. Taube Goes with Vernon Bros.

A. W. Taube, formerly with Marquardt, Blake & Decker, will become connected with Vernon Brothers, paper merchants, 66-68 Duane street, New York, and will specialize in the sale of book and coated papers to publishers and printers. Mr. Taube was for many years in charge of the manufacturing of the Frederick A. Stokes Company, publishers, and has therefore a wide range of experience in handling publishers' requirements.

CONSTRUCTION NEWS

A Summary of Vital Facts Regarding Construction, Finances and Operation of Paper Mills

Menominee, Mich.—The Menominee & Marinette Paper Co., has negotiations under way with the city for the purchase of a plot of land, to be used for the construction of a new plant unit, for which plans will be prepared at an early date. It is estimated to cost close to $200,000, including machinery. The present mill will be continued in service.

Brooklyn, N. Y.—The Scandore Paper Box Co., 169 Franklin Avenue, is taking new bids on a general contract for the erection of an addition to its plant, including improvements in the present structure for increased capacity estimated to cost approximately $60,000. William J. Hohauser, 116 West Thirty-ninth Street, New York, is architect.

Troy, N. Y.—The Manning Paper Co., Green Island, near Troy, N. Y., is said to be arranging for the installation of additional equipment at its local plant, including rolls, 24 x 72 in.; roll grinder and auxiliary equipment.

Quebec, Que.—The Gulf Pulp and Paper Co., 71 Peter Street, has plans under way for the erection of a new pulp and paper mill, estimated to cost in excess of $500,000, including equipment. It is expected to proceed with the project at an early date.

Fort William, Ont.—The Great Lakes Paper Co., is arranging an immediate call for bids for the construction of a new paper mill on site selected, consisting of a group of structures, with power house, machine shop and auxiliary buildings, to cost approximately $1,500,000, with machinery. A list of equipment will be available at an early date.

Antioch, Cal.—The Paraffine Companies, Inc., 40 First Street, San Francisco, Cal., is disposing of a bond issue of $750,000, the entire proceeds to be used in connection with an expansion program as arranged for the current year, including plant extensions and installation of additional machinery. The company specializes in the production of additional machinery. The company specializes in the production of building papers, boxboard and kindred products. Contract has been awarded to Fred Stamm, 25 A Street, Antioch, for the erection of an addition to the local mill, to be one-story, 220x300 ft., estimated to cost approximately $60,000. Work will begin at once. Plans were prepared by Leland Rosener, Insurance Exchange Building, San Francisco, engineer.

Kalamazoo, Mich.—The Sutherland Paper Co., has awarded a general contract to Oscar F. Miller & Co., Kalamazoo, for the erection of a new addition to its plant for considerable increase in output, estimated to cost about $100,000, with equipment. Work will be commenced at an early date.

Powell River, B. C.—The Powell River Pulp & Paper Co., has preliminary plans under way for extensions and improvements in its mills and properties, with the erection of a new paper mill unit to cost in excess of $3,000,000, including equipment.

Providence, R. I.—The R. L. Greene Paper Co., Fountain Street, is perfecting plans for the erection of three additional stories to its present building, and proposes to commence work at an early date.

Washington, D. C.—The American Waste Paper Co., Fifth and V Streets, N. E., has tentative plans under way for the rebuilding of the portion of its one-story warehouse, recently destroyed by fire. The reconstruction is estimated to cost $50,000.

New York, N. Y.—The B. & M. Paper Box Co., 372 Broome Street, has leased space in the building at 168 Greene Street, for extensions in operations for the manufacture of paper boxes and containers. Equipment will be installed at an early date.

Long Island City, N. Y.—Fire recently damaged a portion of the plant of the Ravenswood Paper Co., 545-71 Van Alst Avenue. It will be rebuilt at an early date. An official estimate of loss has not been made.

Framingham, Mass.—The Dennison Mfg. Co., manufacturer of paper specialties, has awarded a general contract to the Morton C. Tuttle Co., Boston, Mass., for the erection of an addition to its plant, including improvements in the present mill.

New Companies

Memphis, Tenn.—The Ramier-Hall Wax Paper Co., 1200 Shrine Building, has been incorporated with a capital of $50,000, to manufacture waxed and other special paper products. The incorporators are J. F. Ramier, and R. W. Hall.

New York, N. Y.—The Rising Star Paper Box Co., has been incorporated with a capital of $100,000, to manufacture paper boxes and containers. The incorporators are T. Thorner, J. and S. Siegel. The Company is represented by L. Diamant, 334 Fifth Avenue, New York.

New York, N. Y.—The J. H. Scott Paper Corporation has been incorporated with a capital of 500 shares of common stock, no par value, to manufacture paper products. The incorporators are A. E. Claffey and P. D. Benson. The company is represented by John McLaren, 154 Nassau Street, New York.

New York, N. Y.—The Best Make Paper Box Mfg. Co., has been incorporated with a nominal capital of $5,000, to manufacture paper boxes and containers. The incorporators are M. Schneider and M. Bookspan. Representative: Weinberg & Oltarsh, 158 Rivington Street, New York.

Los Angeles, Cal.—The Gates-Burns Paper Products Corporation has been incorporated with a capital of $200,000, to manufacture paper specialties. The incorporators are John J. Walther, A. E. Gates, and P. J. Newell. Representative: Fred E. Peterson, 611 Story Building, Los Angeles.

Kansas City, Mo.—The Hale Paper Co., has been incorporated with a capital of $10,000, to manufacture paper specialties, and deal generally in paper goods. The incorporators are Virgil A. Hale and R. F. Wood, both of Kansas City.

New York, N. Y.—Rocco de Fina & Sons, Inc., has been incorporated with a nominal capital of $5,000, to manufacture and deal in paper products. The incorporators are R. de Fina, and C. Catalonello. The company is represented by Aaron Morris, 277 Broadway, New York.

New York, N. Y.—Green, Low & Dolge, Inc., has been incorporated with a capital of $30,000, and 450 shares of common stock, no par value, to manufacture and deal in paper products. Incorporators: A. W. Green, F. G. Low and O. A. Dolge. The company is represented by J. F. Condon, 1315 Boston Road, Bronx.

New York, N. Y.—Friedland Brothers, Inc., has been incorporated with a capital of $15,000, to deal in paper goods of various kinds. The incorporators are S. Friedland and J. Lowenbraun. The company is represented by Isidore Lowenbraun, 116 Nassau Street, New York.

Financial

Augusta, Me.—A petition has been filed in the United States District Court for a merger of the Cushnoc Paper Co., and the Kennebec Paper Co., both of this place and in bankruptcy. It is maintained that the consolidation will permit successful operation and will allow the resumption of production at the mills at an early date.

High Bridge, N. J.—Frederick C. Ritger has been appointed temporary receiver for the Tri-State Pulp & Paper Corporation, a Delaware corporation with local mill. An order has been issued to show cause why the receivership should not be made permanent. The company is said to have liabilities aggregating $131,598.43, with book value of assets stated as $118,000. The application for the receivership was made by Frank G. DuBois, secretary and treasurer of the company, and a creditor in the amount of $21,748.42.

Plattsburg, N. Y.—The Saranac Co. has been merged with the Saranac Pulp & Paper Co., under the last noted name.

FORESTRY in the PAPER INDUSTRY

Conducted by J. R. Simmons, Secretary Forester, the New York State Forestry Association

FORESTERS PRESENT PLANS FOR TIMBER SUPPLY

Government Specialists for All Forest Regions Meet at Madison, Wis., to Further the Work

WHETHER or not we agree with them on all points of policy, the findings and recommendations of any group of intelligent men engaged in the growing of timber crops deserve careful consideration, and should be followed with cooperation. The specialists of the United States Forest Service have just met in conference at Madison, Wis., after three years devoted to intensive study on how to prevent depletion of the forests of the country. This is the experiment station forester's day in court, and having had some material part in the conduct of his investigations,—through the setting aside of private tracts for his observation, the submission of private data for his enlightenment, and even the contribution of funds for promotion of his work,—the pulp and paper manufacturer lends an interested and sympathetic ear to the testimony. He will willingly listen to that testimony as given by the forester himself.

Col. William B. Greeley, chief of the government foresters, leads off with the frank and vigorous statement that the measures proposed by the specialists under his charge will, if put into effect, call a halt to the conversion of forests into waste and idle land, and that they will assure the Nation at least a part of the timber it will need in the years to come.

With heavy cutting, destructive processes of logging, the practical certainty of fire in the debris left on logged-off forest land destroying seed or seed trees, and the prevalence of fire in forests of all ages, the forest often either disappears or greatly deteriorates, as the detailed reports for one forest region after another graphically portrayed before the Madison Conference. So far has the process of forest deterioration gone, according to the conference, that no steps that can now be taken will avert a serious shortage of timber during the next several decades, because of a lack of young growing forests. Measures to stop the further conversion of forests into waste unproductive lands, however, were strongly urged by the forestry specialists as the first step toward assuring a future supply of timber.

The recommended measures which have been worked out by Forest Service officials in consultation with timberland owners, lumbermen, and State officials, will be published as soon as they can be put into final form, so that all interested agencies may make use of them.

Control of forest fires was shown in every forest region to be the first practicable step toward keeping forest lands productive. From the Douglas fir region of the Pacific Northwest to the yellow pine forests of Florida, fire following logging was emphasized as the chief enemy of forest regeneration.

In the South, one of the largest and most important forest regions, fire control is practically lacking. In the Lake States, with 57 million acres of forest lands, control is far from effective, and nowhere is it fully developed. Public organization to combat the forest fire evil must, in the opinion of the forestry conference, be greatly strengthened. Timber operators must be required to abate the logging debris menace, to organize their crews for effective fire fighting, and to keep fire from starting in the woods. Lumbering as generally practiced was shown to create conditions of great fire hazard by leaving large quantities of inflammable debris which often ignites and causes highly destructive fires during the logging operations or afterwards.

Equally dangerous to future forest production in many regions, the research specialists showed, is the reduction of the forest by lumbering to the point where there is insufficient seed to reproduce a forest of satisfactory density or where the invasion of brush, weeds, or inferior tree species may prevent the reestablishment of a forest of commercial value. To overcome this destruction of seed and replacement of forest by brush various measures were recommended suitable to varying conditions, ranging from protecting seed in the ground litter in the Douglas fir region so that it can sprout after logging, to leaving seed trees in the Southern pine region, and leaving standing all trees below a given diameter in the California and Rocky Mountain pine region.

The same methods of preventing forest destruction are not applicable in all regions, according to Chief Forester William B. Greeley, who headed the conference. In general in most forest regions forest regeneration is comparatively easy, and with a fair share of help from the public in the way of fire protection and fair taxation of timberlands, the owner of forest land can fairly be required to keep it productive as a matter of public policy.

The measures to prevent forest destruction were supplemented by suggested methods for building up the productivity of second-growth forests by simple forestry methods. These recommendations are intended for timberland owners who desire to grow timber on a fairly intensive scale. Owners and operators in various parts of the country, it was shown, are already beginning to grow timber in order to keep their mills permanently supplied with raw material.

Serious as is the damage and destruction inflicted on young forests by fire, a still greater loss results from improper methods of cutting forests so that natural reproduction is hindered or prevented, said S. T. Dana, Director of the Northeastern Forest Experiment Station at Amherst, Mass. He laid great emphasis on inducing timberland owners to use better methods in harvesting their mature timber so as to permit the young growth to get started.

KILN DRYING APPLIED TO SEED PRODUCTION

Practical Ideas Applied in Various Ways

PRACTICAL ideas worked out during a period of years by men engaged in the lumber and paper industry are continually being applied in unexpected ways in other lines of economic effort. The latest application of a lumber industry method to the science of forestry is the kiln drying process adopted by the Forest Service for extracting seed from the obstinate clutches of the lodgepole pine cone.

Experiments have been in progress for more than 13 years. Beginning in 1910, the government, acting under the Forest Service, began the collection of large quantities of lodgepole pine seed in order to plant up the areas of forest land denuded by fire. The semi-baking method of opening the cones then in use injured a large proportion of the seeds, and was proving decidedly unsatisfactory. C. C. Bates of the Forest Service has shown that the kiln drying method is not only successful in getting out the seed in a proper condition for germination, but that seeds so treated germinate more satisfactorily in many cases than seeds obtained either naturally or artificially without this treatment.

Under the newly approved method the cones are placed in a kiln which has a strong draft of heated air passing through it. This draft causes such rapid drying that the cones themselves are not much heated. Temperatures as high as 200 degrees Fahrenheit may safely be used if the cones are not too green. This heating and drying seems to be of advantage in so ripening the seeds that they will keep in perfect condition for long periods. Seed has been stored for seven years under cool, dry conditions and have been found more vigorous at the end of that time than were the same lot of seeds when fresh.

A sidelight on this subject is the fact that lodgepole pine will produce seed up to a quarter million an acre with comparatively little reproduction resulting. The deficit is laid to the appetite and industry of squirrels.

* * *

Forestry Progressing

A demand for a state forestry law for Florida was voiced by the Florida Forestry Association at its convention in Jacksonville the last of March, when it was voted that the bill which was ignored in the last legislature would be reintroduced and pressed for passage. The naval stores industry was extensively discussed as one of the features of the Florida forestry problem; also the forestry work being done at the Southern Experiment Station, particularly cooperation with the state agricultural station of Florida and the establishment of a large sized tract of slash pine, second growth on which the Federal service will work for the next five years on research problems.

On the same date, the North Carolina Pine Association at Norfolk was discussing forestry problems as seen by the lumbermen, and adopted resolutions endorsing the McNary-Clarke bill, and calling upon the members to press for its passage.

Paper Men Named

Ever since S. T. Dana, head of the new Forest Experiment Station at Amherst, Mass., proposed the creation of an advisory council selected from private enterprises, there has been much speculation as to what men and how many of them the Secretary of Agriculture would eventually appoint. The Research Council of fifteen members has now been named, three prominent paper men appearing thereon: W. R. Brown, president of the New Hampshire Timberland Owners Association; George W. Sisson, Jr., former president of the American Paper & Pulp Association; and R. S. Kellogg, secretary of the News Print Service Bureau, who is also chairman of the National Forestry Program Committee for whose formation the paper industry was largely responsible.

An interesting development in connection with the Amherst station is the appointment of H. B. Pierson, State Forest Entomologist of Maine, and his assistant, J. A. Beal, as temporary members of the staff. This has been made possible through contributions from private owners interested in the work, which have been turned over to the Forest Service as a cooperative fund. The work will continue chiefly in Maine, and will deal principally with the study and suppression of the ravages of the spruce budworm which has killed the pulp timber on thousands of acres of timberland in the Northeast and in Canada in the past few years. Federal forest entomologists will assist under a cooperative agreement also perfected with the Bureau of Entomology of the Agricultural Department. Mr. Dana states that Mr. Pierson's work in these investigations has been and will be of vital importance to the timber interests in Maine, and to the cause of forest conservation. That results of real value have been already attained and are appreciated is shown by the contributions of more than $8,000 which private owners have willingly provided for this work in order that it may go on.

* * *

New York Claims Lead

That New York leads all the states of the nation in the work done for forestry is shown by a recent report by the Empire State Forest Products Association. In 1923 thirty-two states appropriated money for forestry purposes to a total of $5,410,119, while of this amount New York alone expended $2,242,568. Pennsylvania with about $688,000 was second in the list. Detailed showing of expenditures indicates that New York spent for administration, $23,664, while the total cost for the country was $423,125. For fire prevention, New York spent $169,500 out of a total of $1,726,719 by thirty-two states; for insect prevention, $223,174 out of a total of $607,174; for nurseries and planting, $73,320 out of a total of $211,925, and for state forest purchases $752,930, out of $2,441,166, or a million dollars more than all the other thirty-one states combined. To date the state has appropriated $11,500,000 for land for the forest reserve, and a further purchase totaling $5,000,000 is proposed. The association, which includes many of the most prominent pulp and paper mills in the state, points out that as no wood can be cut from this state land, which is now worth at least three times what it cost, the state has an annual loss of 5 percent on the value, or a total of $2,500,000 a year, because of the failure to utilize the crop of timber growth upon this land.

* * *

Minor Changes in Bills

Last week PAPER reported that the national forestry legislation, as expressed in the Clarke-McNary measure, had arrived on the floor of Congress without material disfigurement. Just what changes were made during the progress of the bills through the committees can now be announced with some precision.

One minor change limits the expenditure of the sum of $100,000 to reforestation and timber growing on farms. The original measure provided for the use of this fund for land chiefly suitable for timber production. The change was made at the insistence of Chairman Haugen, who said that, as $2,500,000 was appropriated for general reforestation work, this smaller item should be confined to farm forestry.

Another amendment changes the fourth section to provide for the distribution of tree planting material for farm purposes, particularly for wind breaks, shelter belts and farm woodlots.

The only other change was that the Geological Survey should cooperate with the Secretary of Agriculture in examining and recommending tracts for purchase for national forests, because of the relation of such forests to regulation of the water flow.

* * *

Forest Protection Week

Forest Protection Week for 1924 has been designated by President Coolidge for April 21-27, inclusive. In his proclamation, President calls attention to the appalling losses that occur each year from forest fires, and urges all citizens, either in association or as individuals, to protect all wooded areas from fire. Governors of many states will issue proclamations supplementing the one issued by the President, and Arbor Day in several States will be observed during Forest Protection Week.

Secretary of Agriculture Wallace and W. B. Greeley, Chief of the Forest Service, have many times emphasized the importance of preventing forest fires, about 36,000 of which every year sweep 11,000,000 acres of land. Secretary Wallace has stated that eight out of every ten forest fires result from human carelessness and will not happen once the public is brought face to face with the serious losses these fires cause. These losses fall especially heavy on the American public since the United States uses more sawtimber than all other nations combined.

* * *

Minnesota Cordwood Volume

Director Raphael Zon of the Lake States Forest Experiment Station reports the preparation of cordwood volume tables for aspen and paper birch, and says that the results of this work will be of material assistance to timberland owners in the Lake States region. The paper and lumbering interests have cooperated in the work by setting aside portions of their land for the measurements. The volume tables show the content of average trees of given heights and diameters in double cords of eight-foot wood.

BROKE WORLD'S RECORD IN NEWSPRINT RUN

Algonquin Company Sets New Mark To Shoot At in Fast Run

THE Algonquin Paper Corporation of Ogdensburg, N. Y., on the 24 hour run which was completed last Saturday morning, broke the world's record in the production of news print paper for one paper machine, producing 102.9 tons of paper. A few weeks ago the same machine which broke the world's record for a 24 hour run made 97 tons of paper in about 23 hours.

The Algonquin plant at Ogdensburg has the largest news paper machine in the world and the world's record made by the machine, manufactured by the Bagley and Sewall Company of Watertown, will give the big mill added prestige.

The world's record established Saturday of last week, after a steady run of 24 hours, will be broken by the same machine at some later date, it is thought by mill officials, who realize that the machine is still new and that when it settles down to real production it will be able to run off a still greater record.

PAPER COMPANY SUES TO RECOVER $299,000

Malone Paper Company Charges Breach of Contract Against Van Dyke Company

TRIAL of the supreme court suit of the Malone Paper Company against the T. H. Van Dyke and Co., Inc., will be held in Jefferson County instead of Franklin County according to papers filed in the county clerk's office last week.

The plaintiff seeks to recover judgment of $299,000, charging that the defendant is responsible for a breach of contract made in 1913 for the purchase of 25,000 cords of pulpwood. In their complaint, the Malone Paper Company points out that they stood ready to buy the pulpwood and because of the failure of the Van Dyke Company to deliver according to contract, the business of the paper concern was seriously hampered and damage amounting to nearly $300,000 was incurred.

The suit was started in 1919 through McCartin, Alverson and Cornwall of this city. The plaintiff is now represented by Attorney A. Raymond Cornwall due to the other two members of the firm having died. The defendant is represented by Kilby, Norris and Smith of Carthage.

According to the contract, the defendant was to have furnished 5,000 cords of pulpwood to the plaintiff each year for a period of five years. The complaint cites that the Van Dyke Company only delivered but 5,701 cords although plaintiff was willing and stood ready to accept shipments according to the conditions of the contract. The price of the wood was stated to be $12.50 a cord. On October 15, 1915, certain provisions of the contract were changed but this in no way interferred with the acceptance by the plaintiff, only changing the number of carloads to be shipped weekly.

The wood was to be cut on the G. T. P. Railway in Quebec and shipped directly to Malone. All of the pulpwood was to be of high quality and subject to inspection.

G. H. Van Dyke, vice president and general manager of the defendant corporation, signed the contract. He lives in Colebrook, N. H. The concern was represented locally by the former Summerville-Ellsworth Pulpwood Co., Inc., of this city.

The trial will no doubt be held during the May term of supreme court.

Hess Is Chairman

Herman M. Hess, of Hess & Densen, 129 West 20th street, New York, has accepted the chairmanship of the Paper Box Manufacturers Group in the Home Service Appeal of the Salvation Army for a maintenance fund of $512,500 for its work in Greater New York during 1924.

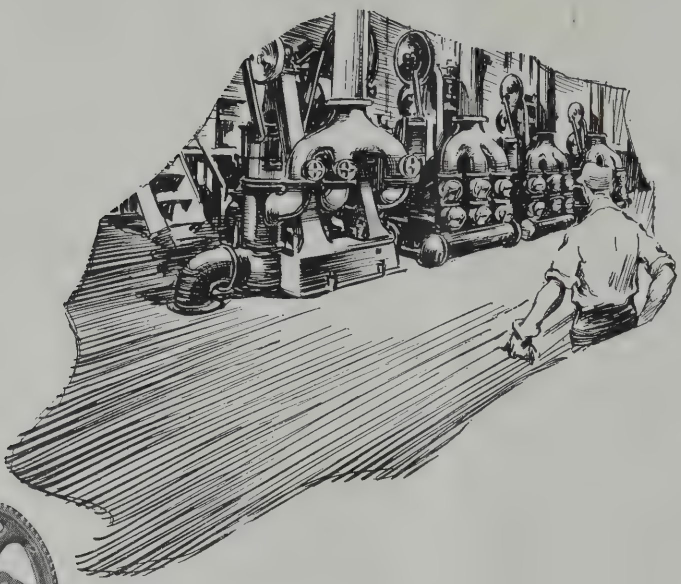
Mr. Hess will appoint a committee to assist him in raising a generous proportion of the Budget and will call a luncheon meeting in the near future, during which the work of solicitation among the members of the Paper Box Manufacturers' Trade will be planned.

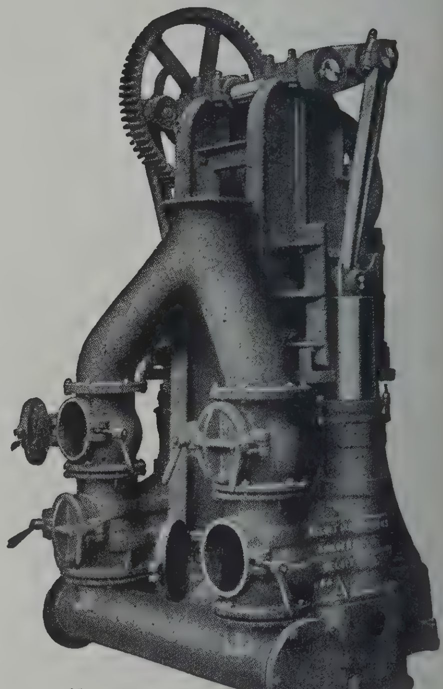
* * *

By-Products of the Forest

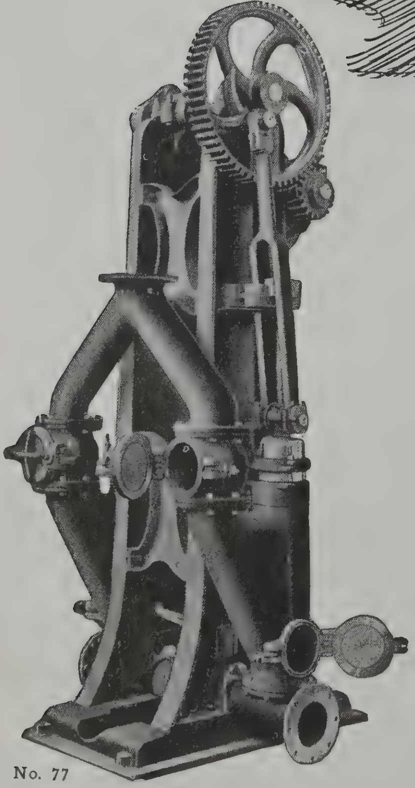
Fully one-half of the 470 millions of forest land in the United States is not suitable for grazing, and the other half should be grazed only after full precautions are taken to protect the young tree growth from injury, according to C. R. Chapline, government grazing expert. Eighty-five million dollars worth of meat and wool are produced yearly from herds of cattle and sheep on the National forests. Grazing must therefore be regarded as highly important economic use of the forest, although secondary to timber growing.

The *Efficiency* Pump for Paper Mills





No. 178



No. 77

BELOIT pumps are called "heavy duty" pumps because they are sturdy and strong. They are built for continuous 24-hour service and are gluttons for hard, steady work. They are regarded as the present-day *efficiency* pump for paper mills.

On our triplex pumps you will find forged steel crank shafts instead of cast steel. Our locomotive type connecting rod (regular equipment on our heavy-duty pumps) takes up the wear on crank and wrist pins while pump is in operation. The self-aligning feature prevents undue strain on cranks or frames.

If ever a part does become broken or worn out after years of hard usage, their construction is so handy that the repair can be effected easily and quickly, without the necessity of buying a considerable portion of a new pump.

Thousands of experienced paper makers the world over know that Beloit pumps "deliver the goods."

It will pay you to turn first to BELOIT.

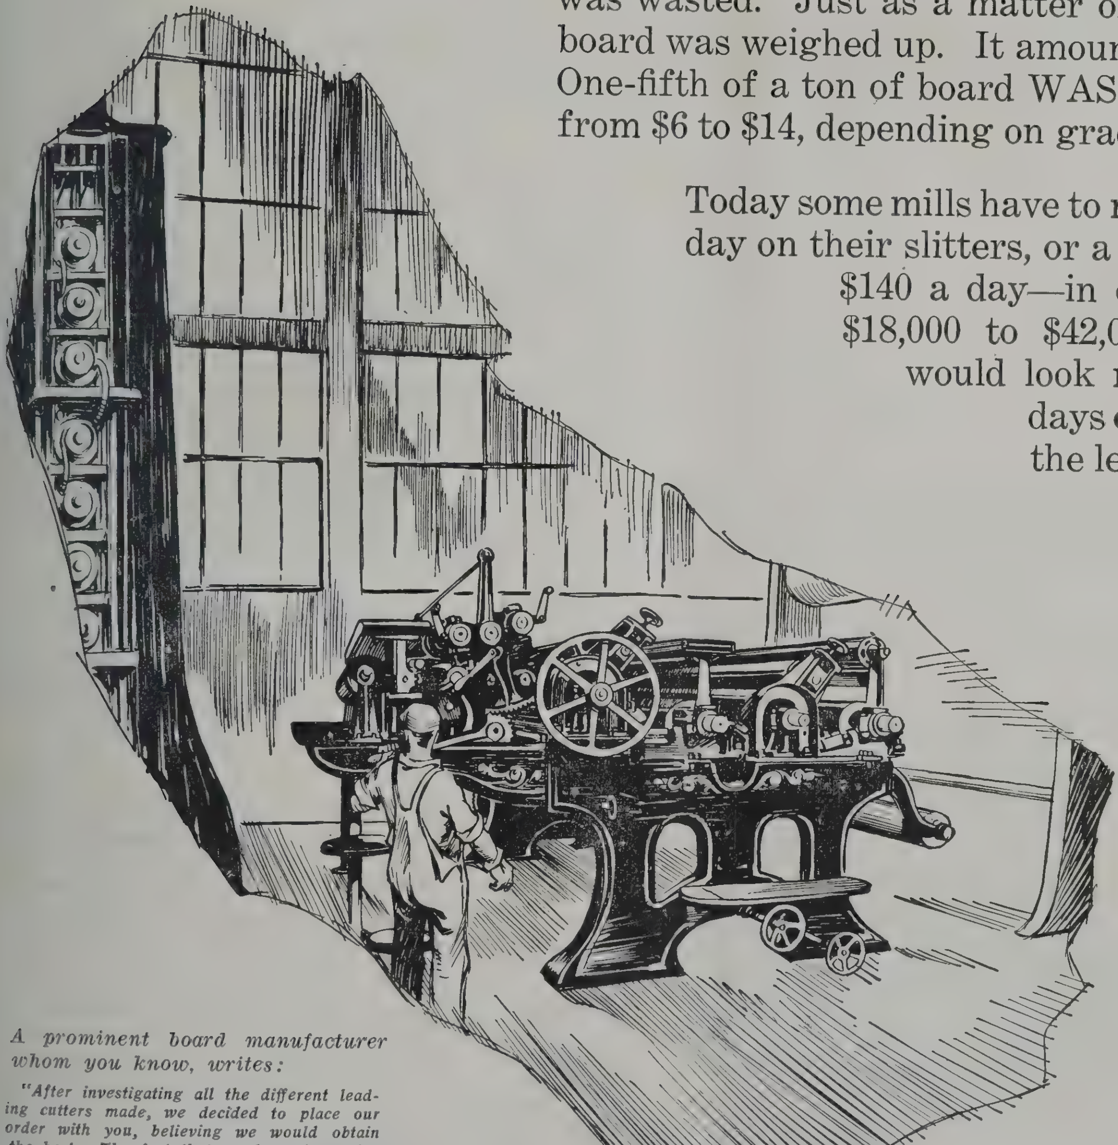
Beloit Iron Works **Beloit, Wis., U. S. A.**

Established Since 1858

Save $18,000 to $42,000 Annually

ONE of our representatives went into a board mill recently and stood at the slitters when widths were being changed. The sheet had been broken down while the slitters were re-set and by the time this was done a large quantity of board was wasted. Just as a matter of information, this board was weighed up. It amounted to 420 pounds! One-fifth of a ton of board WASTED, or in dollars, from $6 to $14, depending on grade of board.

Today some mills have to make ten changes a day on their slitters, or a loss of from $60 to $140 a day—in one year a loss of $18,000 to $42,000. This amount would look mighty good these days on the credit side of the ledger, would it not?



The ***Beloit Duplex Slitter*** *is arranged so that the sheet is NOT broken when changing widths. Simply swing a lever and the job is done—with perhaps four sheets thrown away at the cutter.*

Can YOU afford to be without this attachment NOW?

A prominent board manufacturer whom you know, writes:

"After investigating all the different leading cutters made, we decided to place our order with you, believing we would obtain the best. The fact that we have from time to time, ordered these cutters, making five in all, demonstrates that they are working to our utmost satisfaction."

NEWS FROM CANADA

MYSTERY SURROUNDS RESIGNATIONS OF TWO INSTRUCTORS

Proposed Embargo Is Blamed for Resignations of Forestry School Faculty in Canada

CONSIDERABLE mystery surrounds the resignation of the faculty of the forestry school attached to the University of New Brunswick. Professor B. E. Claridge was the first to announce his intention to quit the school. His resignation was quickly followed by that of his superior, Professor V. P. E. Pulling. The question that is asked is "What was the cause of the two resignations?"

In some quarters, it is held that the proposed embargo and the sentiment in favor of the embargo on pulpwood exportation from Canada to the United States, have been responsible for the two resignations. At the University of New Brunswick, it is believed that sentiment favors the embargo, as an effective means of conserving Canada's pulpwood. It is known that both forestry professors came from the United States to take charge of the school at Fredericton, N. B., and both could be hardly expected to favor such a move as an embargo on pulpwood shipments to the United States. Professor Pulling who was in charge of the school is a graduate of the New York State School of Forestry at Syracuse. He will return to that school as a member of the teaching staff. Professor Claridge who is a graduate of the Yale School of Forestry at New Haven, will go to the Hammermill Paper Company of New York, as a forester on the company's property along the Gaspe coast. He will be established at Matane, near the provincial line between Quebec and New Brunswick. Both men will leave the University of New Brunswick School of Forestry late in May, at the close of the current term.

The embargo question has aroused considerable feeling in some of the forestry schools in Canada. It is felt by some of the university authorities that the heads of the forestry schools in conjunction with Canadian colleges should be Canadians because of the importance of the pulpwood embargo question. Who will succeed the retiring staff of the University of New Brunswick School of Forestry has not been announced. Indications are that a cleavage exists in other schools that will result in resignations at the close of the present academic year. Sentiment in favor of the embargo seems to be growing among Canadians. If the present Canadian government is defeated at the next election, the supplanting administration has promised to introduce the embargo on pulpwood.

The Pulpwood Commission appointed by the Canadian government has finished its labors but it is not expected that the decision will be announced before the first of May, or perhaps later. For some time past the commission operated in two sections, one holding sittings in the western provinces and the other section confining its attention to the eastern provinces.

The claim is made by the pre-embargo faction that most of the evidence adduced before the commission at the many hearings has been given by persons interested vitally in the shipment of pulpwood from Canada to the United States. Spokesmen for the pro-embargo faction claim that representatives of United States pulp and paper companies testified in favor of the abandonment of the embargo as the imposing of an embargo would be highly injurious to these companies.

The Canadian Pulp and Paper Association has placed itself on record as in favor of the embargo as the logical means of conservation for Canada's pulpwood supply. The Canadian Forestry Association has also been registered for the embargo. The largest of the pulp and paper manufacturing concerns, controlled by Canadian and British capital have pronounced in favor of the embargo. Price Brothers, one of the biggest of pulp and paper manufacturing firms has been working vigorously for the embargo. Sir William Price, head of this concern, has been speaking before civic fraternal and legislative bodies in favor of the embargo.

One of the leaders in the fight for the embargo is F. J. D. Barnjum of Annapolis Royal and Montreal. Mr. Barnjum was a Liberal in politics but when the present Liberal administration at Ottawa refused to introduce the embargo without first sending a commission on the road for investigation purposes, he aligned himself with the Conservative party and delivered speeches at two special elections both of which resulted in defeats for the present administrations, in constituencies that had previously sent supporters of the present government to Ottawa. Mr. Barnjum is President of the McLeod Pulp and Paper Company, operating a mill at Milten, N. S. He is also the owner of large tracts of pulpwood lands in eastern Canada.

* * *

Buy 13 Airplanes

C. R. Mills, Assistant Provincial Forester for Ontario, speaking at a meeting of fire rangers in Sudbury, Ont., announced officially that the Ontario government had purchased thirteen airplanes for forest fire protection purposes, and that seven of these 'planes would have their headquarters at Sudbury, as compared with four last year. A complete repair and parts maintenances stores would be established at Sudbury also. It was also announced that the proposed reduction in the staff of the chief fire rangers would be reduced by about 40 per cent. From the trend the discussion took it was apparent that veteran chief fire rangers are far from convinced that the airplane and radio are of any great value in forest fire protection. The telephone, it was agreed, is still and will continue to be the chief method of communication. The advent of the airplane and radio, and consequent heavy expense is blamed for the cutting down of the fire ranging staff.

CANADIAN NEWSPRINT PRICES CHANGE

Cut of at Least $5 Per Ton Are Made Regarding July Prices

IT is difficult to distinguish the real news from the propaganda with respect to the probable price of Canadian newsprint after the 1st of July. Predictions have gone so far as to predict a second cut within the year. There are some reasons that would seem to warrant the first prediction, but few, if any at all to warrant the second. There is, however, an impression that the Canadian newsprint industry in its expansion has possibly outrun demand. There is now being installed in northwestern Ontario the thirteenth machine that has gone in since the 1st of January, 1923, with an increase in the production of 1,000 tons daily, or over 300,000 tons a year. This comes perilously near equalling 25 per cent of the total Canadian production. To absorb all this requires quite an increase in consumption, and the question was bound to arise, is the demand equal to the increased supply.

Another weakness in the Canadian situation is to be found in the fact that the mills are becoming dependent more and more on the market. In 1919 out of total exports of newsprint amounting to 13,248,542 cwts., the United States took 11,880,069. In 1920 it took 12,583,349 out of a total of 14,272,513 cwts.; in 1921 it took 13,376,836 out of a total of 15,112,586; in 1922 14,106,128 cwts. out of a total of 15,138,327. In 1923 the United States took 18,836,245 cwts. out of total exports of 20,130,466; but during the last year the process of being narrowed to the American market has been intensified, for during the first 10 months the United States took 18,743,500 out of total exports amounting to 19,020,728 cwts.

There is no doubt that much of the reasoning as to the probable increase in the general demand has been based on the assumption that there would be a marked continuous increase in the demand from the United States, and that this would continue to assert itself even if the newspapers did not actually require much more newsprint. It has been assumed that the low cost of production in Canadian mills would render it unprofitable for some mills on the American side to continue operations, and that the mills over here would get the business thus dropped. While some American mills are being closed, still it is not as easy for all of them to do so as it is for some others. The International can readily convert some of theirs into power plants, but as soon as some others cease to make paper they close down altogether. The result is that American mills are not being put out as fast as new newsprint machines on the Canadian side are coming in.

On the other hand it is said that a short interest in the stock market is responsible for much of the talk about probable price reductions. If such is the case it has chosen a good time to affect the market for paper stocks certainly fell off following some of these reports. It is understood that the paper producers have not as yet given a great

deal of consideration to the question of prices for the second half of the year, and that for the very good reason that their contracts have over two months yet to run. At the same time it is true that the year began with a surplus production of 40,000 tons of newsprint uncontracted for. As this has to find a market it is a disturbing factor.

Speaking generally the demand from the United States is holding up remarkably well. Recent paper mergers over there have not lessened, but have increased the demand for paper, and as far as can be judged at present this will continue until the end of the year. The Canadian industry generally is very confident of the future, that is taking a long range view of things; for it knows that it has the raw material, that it has the water powers that go to make production cheap and that the publishing industry is steadily expanding. But it is also recognized that the rate of expansion reached in Canada during the last year cannot be maintained, and that soft spots in the market will be met.

* * *

Merger Negotiations Again

The merger negotiations looking to the coming together of several important pulp and paper enterprises in the St. Maurice district, Quebec, are apparently coming to life again. For a time they seemed to have died though at times there were stirrings indicating that they were not quite extinct. It is understood that two plans are being considered. One of these contemplates a working agreement between nearly all the companies in the St. Maurice district each retaining its present identity; while the other plan contemplates a real merger. At present the former seems to be most favored.

From reliable information it is gathered that several of the companies operating in the St. Maurice district are not any too well supplied with timber in close proximity to their mills. It is true that they have large reserve limits, but for the most part these are in other parts of the province, and not conveniently, or as profitably, located as could be desired. For this reason a working agreement along the lines suggested is proposed. This would not only mean better working conditions, but co-operation with large companies such as Price Brothers and the Brown Corporation, which might be expected, would have the effect of stabilizing the price of pulp and paper.

The proposed arrangement would assure to all concerned an ample supply of pulpwood at uniform prices which would apply to wood whether drawn from the north shore of the St. Lawrence, or from the Gaspe limits; from up the St. Lawrence, or from the St. Maurice district. It is believed that the Quebec government would be favorable to such an arrangement, for the more the pulp and paper industry is stabilized the better for the provinces as a whole. It should not be difficult for the companies to work together, for even now their logs are floated under common control.

* * *

Plan for Power Dam

The Continental Wood Products Company of Elsas, Ontario, has prepared plans for a power dam that will be required for a new kraft pulp mill of 75 tons capacity to be built at Elsas. The saw mill will be doubled in capacity in order to supply material for the kraft mill.

* * *

Confirm Wilson's Addition

The addition of L. R. Wilson to the board of the Abitibi Power & Paper Company was confirmed by a recent meeting of the directors following the annual meeting. He has a long record of service with the company, first as secretary and more recently as general manager, and he brings to the board a splendid general knowledge of the practical side of the company's operations.

Returns After A Year

C. E. French, of the Howard Smith Paper Mills, has returned to the Toronto office after nearly a year spent in the interests of the company in South America where he established in the various Latin countries satisfactory business connections in the shape of substantial orders for Standard Mill Watermarks and other grades such as blotting, bristols and Patent Coated Folding Boxboard. Mr. French found that the greatest tonnage of paper in South America was coming from Germany and Scandinavia. The explanation of this is, he said, that the standards of Latin America are on a very different plane from those of North America. The German and Scandinavian standards he found to be similar to the demands of the Latins, so that in that respect the road is already paved for Made in Germany, or Scandinavian paper. "Pride in one's paper, such as we in Canada have," he said, "is most certainly not very marked, the desire being to obtain the cheapest sheet possible, with little regard to quality. There are, however, a number of firms, usually run by Europeans, who have cultivated a demand for high grade papers, and it was from such firms that I was able to obtain some very satisfactory orders." Mr. French had a number of interesting experiences, including an eight-hour airplane trip from the Carribean Sea to Bogota, the capital of Columbia. After his return to Canada Mr. French received the congratulations of many friends on his marriage, a few days ago, to a popular St. John, N. B., lady.

* * *

Operating Fast

The Nipigon Corporation, Limited, at Nipigon, Ont., is operating at full capacity in its groundwood plant with three lines of grinders. All the equipment has been thoroughly re-set. The company reports that they purchased all their pulpwood requirements locally this season, the groundwood finding a ready market both in Canada and the United States. The labor situation, the company reports, has presented some difficulty as skilled help is practically unknown in the Nipigon district.

* * *

Mill Closes Down

The Frazer pulp mill at Millbank, N. B., closed down recently for a short time in order that repairs might be made. The company is installing a power plant of its own, the Bathurst Company, which has been supplying hydro power being unable to continue the service. It is expected that the new power plant will be in operation by May 1. Both warehouses of the company on the north and south side of the river are filled with pulp awaiting the opening of navigation for shipment.

* * *

Change Head Office

The head office of the Belleville Paper Mills has been changed from Belleville, Ont., to Montreal. The mills manufacture straw and chipped board, pleated carpet linings, etc.

* * *

O'Donnell Disappears

It was announced in the Ontario Legislature a few days ago that J. L. O'Donnell, Crown Lands Agent at Hearst, Ont., had disappeared and there are discrepancies in the books amounting to several thousands. O'Donnell was under bonds, stated Honorable James Lyons, Minister of Lands and Forests.

* * *

Plan New Building

Plans are now being prepared for a new forestry building to be erected this summer in connection with the University of Toronto. The structure will be on St. George Street, Toronto, and will cost about $100,000. The building will be approximately 50x40 feet and it will be such that it will accommodate the whole faculty of forestry. The present building will be continued as a botany building.

Weakness In Newsprint

The Financial Post of Toronto has the following to say on the Canadian newsprint situation.

"Already there are evidences of weakness in the newsprint market and it is anticipated that market prices will slump before the end of the year. The rapid increase in production has overtaken the increase in consumption. However, most of the Canadian newsprint mills have their product sold for the first six months of the year at least, and many of them for the entire year. After that even weaker conditions may develop in newsprint, it is felt by many in the industry. Investors in the newsprint stocks may take these indications as a unfavorable market factors, as the moment, that may have a tendency to prevent any substantial improvement in the newsprint stocks. But there is nothing in the situation to make any holder of newsprint shares worried. The Canadian mills are, on the whole, able to produce newsprint at much lower costs than American mills and the companies are financially strong enough to stand any strain until increased consumption of newsprint, and the conversion of many United States mills to power plants or high grade paper plants relieves the situation."

* * *

Off To Australia

A. L. Dawe, manager of the Canadian Export Paper Company, has left for Australia. His company, which acts for many of the largest of the Canadian mills, has an agency in Australia and sells considerable paper there. It is said that while his visit has no special significance, still as for some time efforts have been made to have Canadian newsprint enter that Dominion on the same conditions as that from Britain does, it is quite possible that Mr. Dawe may do a little missionary work. Canadian mills would like to get back a share of the Australian market.

* * *

Iverson Dies

John Martin Iverson, superintendent of the kraft plant of the St. Maurice Paper Company, Three Rivers, Que., died a few days ago after an operation. For over a year he was suffering from cancer of the stomach and in the last two months the malady had grown worse. Mr. Iverson was 61 years of age and was born in Norway. He received his education there, where he became an expert in the making of kraft paper. He was formerly associated with the Canada Paper Company at Windsor Mills, Que. Eight years ago he entered the service of the St. Maurice Paper Company, having previously been connected with the Wayagamack Pulp and Paper Company. He is survived by his wife, two sons and three daughters.

Expect Report Soon

The Canadian government expects that the Pulpwood Commission will report its findings in time to enable action, if necessary, to be taken upon it during the present session of Parliament. This statement came recently in response to questions asked in the House of Commons. The reply said that the Commission had taken evidence in all part of Canada, and it was not expected that further hearings would be necessary. It had been instructed to make a thorough inquiry, and was expected to exercise its own discretion in doing so, and its conclusions were looked for before the end of the session.

Unusual Production Made

During March the Spanish River Pulp & Paper Mills has an average daily output of 698 tons of newsprint, there having been several days when over 700 tons were reached. This means that the mills have been running capacity, and there is every prospect of this continuing.

Vacuum Paper Machine Dryer

Outstanding Advance in Methods of Drying Paper Is Marked by Development of Minton Vacuum Paper Machine Dryer

By OGDEN MINTON
Greenwich, Conn.

THE first improvement of large importance in the art of papermaking was marked by the advent of the Fourdrinier paper machine, with which papermakers everywhere today are familiar. Surprising as it may seem, pictures and cuts of the first Fourdrinier type of papermachines show them to have been quite similar to present day type of papermachines.

Some of the oldest machines had suction boxes, couch rolls, felt presses, and a bank of dryers. The author of this article has talked with a veteran papermaker who told him of building and keeping fires going inside the "cans" as he called the dryer cylinders. It was not a far step from the fire to steam within the dryer cylinders, and the addition of dryer felts was a natural development in view of the necessity of passing the paper over a large number of dryers and of keeping the paper in tight contact with the dryer shells.

By way of improvement of the modern machine, it would appear to be advantageous to raise the temperature of dryer shells to a much higher temperature than is commonly done, and thereby to dry paper more rapidly and with fewer dryers. But it is not possible safely to raise the pressure of the steam (and therefore the temperature) much over 50 lb. because of the insufficient strength of dryer cylinders. Also papermakers have learned that high temperatures injure the fibers of the paper and that paper dried at a high temperature is not as strong or so good in many ways as when dried at lower temperature.

Seals for Vacuum Paper Machine Dryer

It occurred to the author that some way could be found of drying paper at low temperatures and yet drying it rapidly. The only method he knew of was to dry it under a high vacuum. Accordingly he set out to develop a Vacuum Paper Machine Dryer. The problem soon simmered down to a method of getting paper into and out of a vacuum chamber continuously without breaking the vacuum. The manner of applying heat to the paper after it was once in the vacuum was simple, as present drying equipment could be used for this purpose. The problem then was to devise an ingoing, and outgoing, seal that would allow the paper to pass into, and out of, a vacuum chamber, in which chamber present drying equipment could be placed.

Many different forms of seals were experimented with. The first successful seal was a mercury column, through which the paper passed into, and out of, the machine. As far as sealing was concerned, the mercury seal performed perfectly. Mercury, however, was found to be difficult to handle, easy to lose, and expensive. Eventually a seal not having the disadvantages referred to was perfected. The drawings No. 481, 482 and 483, showing this seal illustrate how simple the latest type of this seal has really become

The great problem was to make the seal so efficient as to keep air from entering the vacuum chamber where it rapidly expanded and became costly to pump out. After working with seals of many different kinds, it was learned that to allow water to leak into the vacuum chamber was not at all objectionable since the water was needed for the condenser and eventually had to be supplied anyway. The present type of seal takes advantage of this fact. Instead of allowing air to leak into the vacuum chamber, water is allowed to leak in, after which it is led directly to the condenser.

The present seal consists of two bronze covered rolls, with special sealing rings at their ends, a rubber covered roll with similar sealing rings at its ends, and a cast iron housing equipped with grooves into which is placed rubber tubing ¾ inch in diameter, with a ¼ inch hole in the center. Water is supplied as a sealing medium and also acts as a lubricant to the rubber. The two bronze rolls as shown in the drawings, have one side immersed in water. Water leaks past the rubber tubes into the vacuum chamber, but because the vacuum holds the rubber tubes tight against the roll and the housing, the quantity of water that thus leaks past the tubes is very small. The second rubber acts much like a window wiper and wipes the roll dry so that its surface coming in contact with the paper is at all times dry and clean. If the proper kind of rubber is used, water forms almost a perfect lubricant and the friction is so low that it is not an important factor.

Mechanical Considerations

An examination of the accompanying drawings of vacuum papermachine dryers disclose the ingoing and the outgoing seals, the cast iron chamber, the series of dryers, felts, with felt carrying rolls including hand and automatic take-up rolls and hand and automatic guide rolls. The construction of the seals is clearly shown in the drawings. Ball bearings are fitted on all the sealing rolls. By taking out nine cap screws on each side frame of the seal and eight rubber tube holding plugs the side frames, together with the three sealing rolls, may be lifted off the machine as a single unit, exposing the entire inside of the seal and allowing it to be inspected and cleaned, and the rubbers changed, if necessary. By simply taking off the caps over the ends of the rolls and loosening the nuts over the ball bearings, the side frames can be taken off and the entire seal dismantled, making the rolls readily available for regrinding or recovering should there be need of either.

The cast iron chamber is made in unit construction. A study of the cuts will show that each dryer has two side frames, both of which are identical, and one cover plate. If the dryer happens to be a top dryer this cover acts as a top piece, and if it happens to be a bottom dryer this cover acts as a foundation plate. By unbolting one front section, a dryer may be slid out the front of the machine for repairs with little more effort than in the present type of machine. Any felt roll can be removed by unbolting the false frame in front and back and sliding the roll out through the opening so formed, an operation quite as easily performed as in the present type of dryer unit. The sections of the chamber are made of cast iron, suitably ribbed for strength and stiffness, and have surfaces planed where they bolt together. These sections can all be stacked in a planer and a whole group planed at one setting of the planer.

The cut of the assembled dryer bearing and stuffing box shows the method of bolting the bearing housing to the side frames. By means of two small jack screws on the front and rear frames, the dryer roll may be set absolutely on the correct centers. The ball bearings and housing assembled is then placed and bolted, after which two special dowel pins, with nuts on their ends to facilitate removal, are put in holes drilled through the bearings housing and the front or rear frames as the case may be. These dowel pins insure that the bearing, if taken out ofter the original assembling, will necessarily go back in exactly the same place and the dryer roll will be on its correct center line. This is important not only so that the paper will draw well through the machine, but so that the driving gears will always run on correct centers and the teeth mesh on their

true pitch circles, thereby making for long life and quiet running gears with little back lash.

Drawing No. 488 of the stuffing box shows an oil pipe leading to an H section bronze ring placed between the different groups of packing. This not only lubricates the stuffing box, adds life to the packing, and cuts down the loss due to friction, but it also insures that there will be no air leaks. The oil pressure is slightly greater than atmospheric pressure because of the head of oil from the tank to the bearing, which is sufficient to cause oil to force back the atmosphere, and leak outwardly as well as inwardly. The oil that leaks inwardly lubricates the ball bearing, and when it reaches a certain height it flows off through the overflow pipe to a small pump, which pumps it back to the original tank. There is a check valve in this line to prevent air leaking back. The quantity that leaks outwardly has been found to be very small. It can be run to a small pump and pumped back, if desired, or it can be collected in a drip pan, which has been found entirely satisfactory. This construction insures a total absence of air leak around the stuffing boxes and affords perfect lubrication.

The cut of the ball bearing housing shows the ball bearings being held in place on the rear of the machine so that there is no end play. The bearing on the front of the machine is not so held. This allows the dryer shell to expand and push the front ball bearing back or forward in cooling off in heating up. This expansion in a very wide machine is considerable and in the very widest machines provision is made for the front bearing to slide very easily in the housing by other means than shown in this cut. The ball bearing races are ground out slightly larger than standard bearings to allow for expansion due to heat.

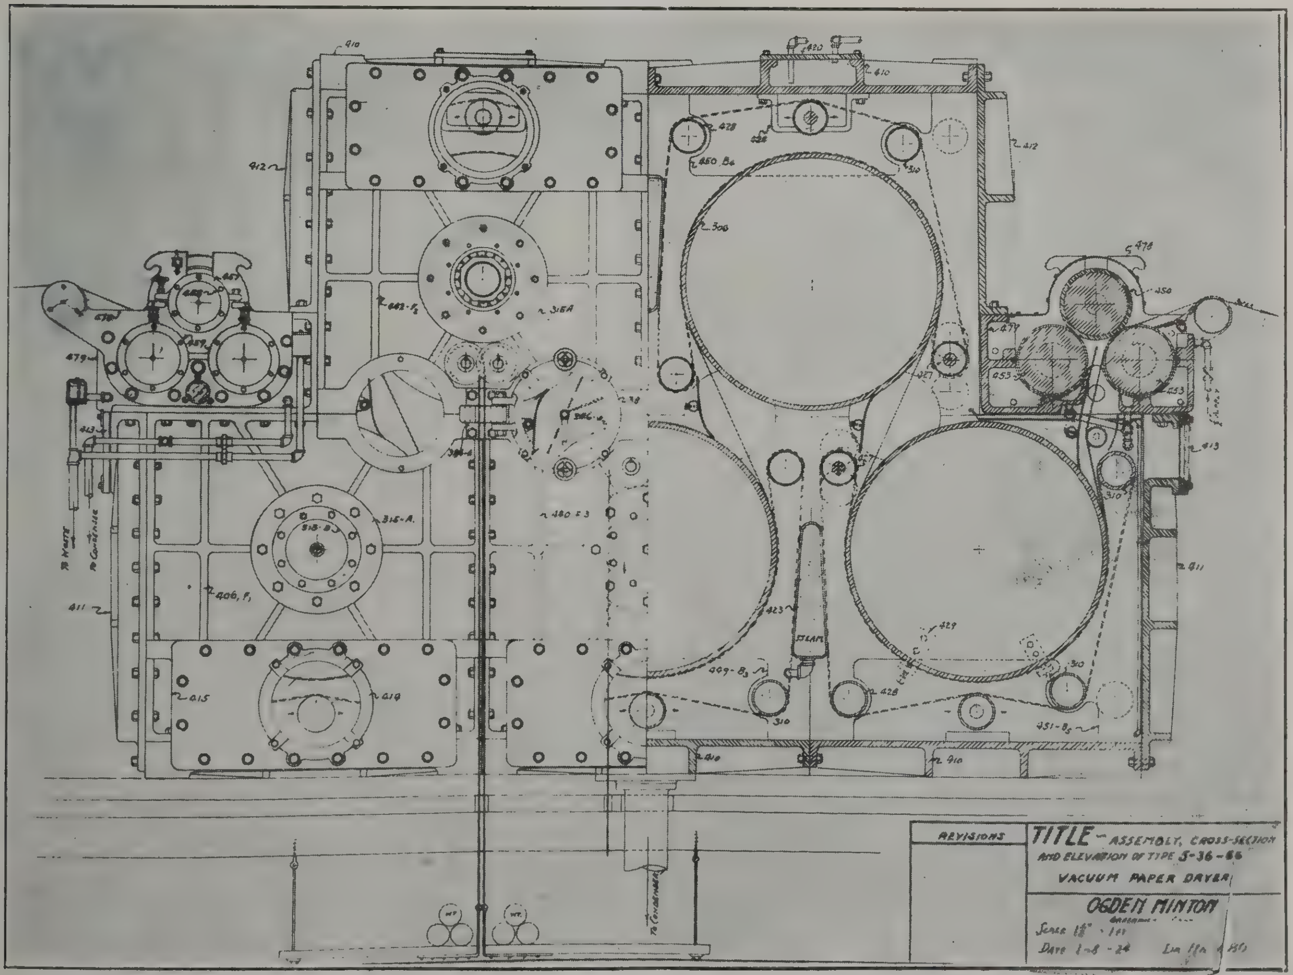
All dryers, felt carrying rolls, and seal rolls, are balanced statically and dynamically so that vibration is eliminated.

Working of the Automatic Guide Roll

As the entire machine is enclosed in the cast iron chamber it is necessary to be certain that the automatic guide roll operates with certainty. Drawing No. 484 shows how this has been accomplished. The automatic guide roll consists of a shell mounted on ball bearings fixed on a stationary shaft. This shaft is pivoted at one end, the other end, which is mounted on a small ball bearing, moves forward and backward, the bearing running on a guide. The guide actuating roll has a stationary shaft on which the shell is mounted and on the front end there is a separate piece, also mounted on ball bearings. This is made to pull the guide roll by means of a small bronze cable, when the felt runs up on this part. A spring pulls the guide roll backward when the actuating roll is not pulling it forward. Because of the ball bearings and this special design, the guide is very sensitive and holds the felt within close limits. Due to the fact that, when the dryer felts are not properly made, they sometimes tend to run off one way, or the other, and, get to a point beyond the control of the automatic guide a hand guide has been included in the design.

Drawing No. 485 of the automatic stretch roll shows clearly how this operates. The operating shaft is taken out through a stuffing box in the side frame. A steel cable goes down under the floor to which weights are suspended to obtain any desired tension in the felts. There are two of these weight suspension devices, one on each end of the automatic stretch roll.

Because of the unit construction of the machine, the following standards have been adopted to facilitate manufacture and to attain better proportions and machine design advantages. For machines up to 90 in. wide, a 36 in. diameter dryer is used; for machines from 90 in. to 160 in. wide, a 48 in. diameter dryer is used; and for all machines



Vacuum Paper Machine Drier, Assembly Cross-Section and Elevation over 160 in., a 60 in. diameter dryer is used. Designs have been made, and stress and strain diagrams, and weights figures, for a machine 240 inches wide. The total weight of the complete vacuum paper machine dryer is slightly less than that of the present standard type of dryer of the same capacity. Of course, the vacuum paper machine dryer unit has comparatively fewer dryers.

Felt Dryers

Felt dryers of the cell type were installed for a time in the test machine for experimental purposes. Vapor leaving the sheet of paper and passing into the felt remains vapor and passes on through the felt to the vacuum chamber. It can not condense to water, for to do so it must give up its latent heat, which is impossible since the temperature of the surrounding vapor, of the felts, and of this vapor is exactly the same unless there is a difference of temperature there can be no exchange of heat units. The only useful function felt dryers could possible perform would be to warm up the felt and conduct heat units to the paper. But felts are poor conductors of heat and have capacity to absorb little heat from the felt dryers for transmittal to the paper. This is a very different phenomenon than that which occurs in the present standard type of paper machine dryer, where the vapor from the sheet passes into the felt and condenses, causing the felts to run damp, thereby retarding the drying, and making it necessary to equip the machine with felt dryers.

Changing Dryer Felts

Cross section drawing No. 480 of the type 5-36-66 Vacuum Paper Machine Dryer (5 dryers, 3 inches in diameter, with a 66 inch face) shows individual dryer felts on each dryer. These individual dryer felts were put on this machine so that the dryers could be compensated (run at slightly different speeds) in order that high grade paper might be dried without being stretched. To accomplish this result each succeeding dryer is run at a speed slightly less than the preceding dryer. With this adjustment paper the equivalent of loft-dried paper is produced. When individual felts are used, the endless woolen type is preferred. The felt-carrying rolls are so designed that they may be removed through the front windows. It is not a difficult task to replace a felt, but it seldom has to be done. The life of woolen dryer felts in this type of machine is extremely long, because of the low temperature to which they are exposed, to the slow speed, to the ball bearing rolls which relieve the drag, and to the fact that never get wet. Cross section drawing No. 491, of the larger dryer section type 15-48-120, shows simply one upper and one lower felt, since this machine, being designed as a book-paper machine, is not compensated. From this latter machine, felt dryers have been eliminated, for reasons explained heretofore. The felts on Type 15-48-120 may be changed in the same manner as in the present type paper machines, except that the door shown at the end of the vacuum type of machine must first be opened. This door may be opened in less than five minutes time and replaced in another five minutes on even a larger machine. In other words there is a delay of only 10 minutes over present methods which delay is but a small proportion of the total time in changing a dryer felt on a wide machine.

Passing Paper

When the first vacuum paper machine dryer was being designed apprehension was felt that passing the paper through the machine might present much difficulty. Accordingly, specially designed, complicated steam doctors

were included in the original design. These worked splendidly. But when the machine was first started up, someone neglected to turn the steam into the doctors. Nevertheless, the paper was seen to pass through the machine just as desired. As soon as this was observed the paper was broken down and repassed through the machine. Each time it automatically threaded itself. Needless to say the complicated steam doctors were promptly removed. A study of this situation revealed the fact that, because of the high vacuum, the atmosphere in the vacuum chamber was not sufficient to deflect the paper. Without intending to do so, the old physics experiment of a penny and a feather falling at the same speed in a vacuum tube had been reproduced. Upon leaving one dryer the paper travels straight to the next dryer. It has no tendency to crumble up. Of course, the paper must have sufficient speed to give it momentum to jump the pass. This speed has been found to be about 200 ft. per minute. The faster it travels, the more certain is it to make the pass. A piece of cardboard about nine inches wide and four feet long is passed through with the paper, to help it make the first few passes, since the paper, near the wet end of the dryer, has little body and tends to cling to the dryer shells. The cardboard pieces pass through the machine with the paper, and out through the outgoing seal and may be used over and over again. If cardboard does not happen to be available any dry piece of paper, folded over a few times, answers the purpose just about as well. The cardboard strips, however, serve another purpose in that they fold the end of the paper over and place it in the bite between the rubber and bronze roll of the ingoing seal, and minimize the danger of a machine tender getting his fingers caught in this bite, which has made it possible to place a guard at this point to prevent accidents. After starting the paper into the ingoing seal, the paper threads itself through the machine and out through the outgoing seal, where it is taken and passed through the calendar, size tub, or to the reel, as the case may be, in any manner desired. The worst that can happen is for the paper to miss a pass, in which case it falls back and is carried by the felt around the next bottom dryer, skipping the top dryer. In this case the paper is broken down at the entrance and repassed through the machine. Doctors on each dryer prevent the paper from wrapping around a dryer.

Removing Broke

The vacuum paper machine dryer is fitted with doors, in each of which there is a glass window. These doors can be quickly opened, and are so located that they are directly in front of the pass. A little study of the drawings will show that when these doors are opened a space is provided through which the paper may be speared off in case of failure of a dryer doctor or the snapping off of the paper resulting in its wrapping around a dryer, just as it is now done on standard paper machines. These doors give just about the same size opening as there is between the front frames on a standard paper machine dryer and broke may be removed in the same manner as at present. Paper however, never breaks on a dryer section till it becomes partly dry. It has much elasticity when wet, so that it will stretch rather than break. But in the vacuum paper machine dryer, after the paper has become slightly dry it will pass of its own accord. To demonstrate this fact, the author went to a good deal of trouble to make a device to break paper inside the dryer., But because of delicate control all through the machine, a break is a rare occurrence in a vacuum paper machine dryer.

Process of Drying Visible

The inside of the vacuum paper machine dryer is fitted with electric lights, making the entire inside of the machine visible. The several doors with glass windows, allow the process of drying to be watched. The vapor coming off the paper is a true vapor. There is no fog to obstruct the vision and to a stranger to the vacuum process it looks as though there is no drying going on. The paper, when passing through the machine, may be watched. It is an interesting sight to see it, automatically and of its own accord, pass from dryer to dryer and finally out through the outgoing seal to the atmosphere.

Control of Drying

The boiling point of water at 28 in. vacuum is 100° F. The temperature of paper on the dryer in the vacuum can never exceed 100° F. until it becomes absolutely dry. For water cannot exist, as water, but must turn to vapor at any temperature above 100° F at a 28 in. vacuum. This fact gives a very low drying temperature, which can be varied at will, up or down, depending on the amount of vacuum. When the vacuum is changed, and this may be done quickly, the drying conditions are instantly changed. There is no delay in bringing about the change as in the case of standard paper machine dryers where changed drying conditions are dependent entirely upon raising or lowering the temperature of the dryers, by increasing or decreasing the pressure of the steam within the dryers and then waiting for them to heat up or cool off, as the case may be. Drawing No. 489 shows the automatic vacuum control. In this device there is a glass tube, one end of which is immersed in a small tank of mercury and the other end fits into a special pipe fitting made from an angle valve. One end of the angle valve fitting is connected, by a pipe, to the vacuum chamber. There is a small steel rod, with a needle point on the end, going down into the glass tube. The valve stem packing gland packs this against air leaks, but allows the needle to be raised, or lowered, in the glass tube. As the vacuum increases the mercury rises in the tube until it comes in contact with the needle, which makes an electrical contact through a relay and battery (as shown) and a wire from the battery into the mercury. This relay in turn operates a solenoid controlled valve, allowing air to leak into the vacuum chamber, thus preventing the vacuum from increasing further. The solenoid controlled valve has another valve attached to it, which can be operated by hand in case of failure of the solenoid, and also to regulate the size opening for the air to leak into the vacuum chamber. This device can be made to control the vacuum within .002 inches. By raising or lowering the rod with the needle point in the glass column, any amount of vacuum may be selected and maintained automatically and thereby control the rate of drying as previously explained. This rod may be operated by a device which operates directly from the wetness or dryness of the paper, in which case the control is entirely automatic. This last feature is not shown in the drawing.

Seeking Reliable Data

Much data is being collected by skilled engineers who have recently given the subject of drying a great deal of thought and eventually reliable data will be obtained. The difficulties are great, however, and after the data are all at hand it is going to be quite a task to make assumptions from this data as to just what takes place. Such questions as, What happens to the sheet of paper passing from dryer to dryer? will have to be answered. Does water actually evaporate in the pass? If it does evaporate it must get its latent heat from somewhere to do so. Where does it get it? The temperature of the various dryers increases as we approach the dry end. How then shall we get an average figure of evaporation? Many such questions can be asked and in the present state of the art it is quite impossible to answer these questions entirely satisfactorily.

Some difficulty has been encountered in explaining the phenomenon of evaporation at temperatures under 212° F., but the following helps to an understanding. Under a vacuum of 28 inches of mercury for example, the steam tables indicate the temperature of evaporation to be practically 100° F. and the quantity of water in 1 cu. ft. of vapor to be 0.002851 lb. The humidity table indicates that 1 cu. ft.

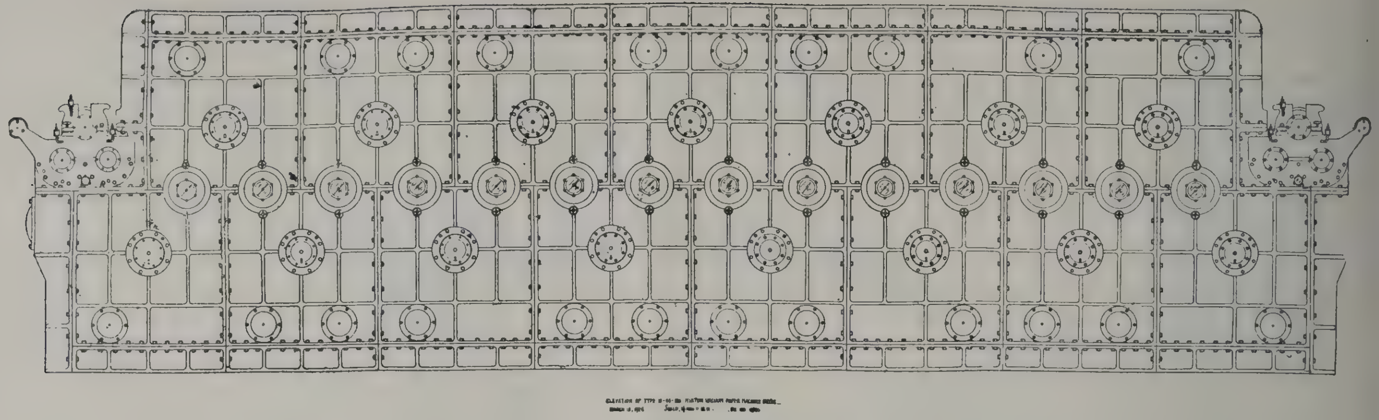
Ledger Accounts in String

Five hundred years ago the ruling Incas of Peru required their subjects to deposit all grain in community warehouses. From these it was reissued as needed and the government took its percentage as a tax. Printed income tax forms and business receipts on paper were unknown, but each tax-paying citizen was recorded on a string suited to his station in life.

Rather crude and uncertain, the ways the Peruvians had of recording their transactions years before the three little caravels of Columbus made their painful way to the West Indies. The advantages of our civilization were impossible under such circumstances.

Our higher standard of living could not be maintained today if it were not for generous quantities of paper and efficiently operated printing presses.

Hammermill Paper Company
Erie, Pennsylvania



Elevation of Vacuum Drier for 230-in. High Speed News Machine

of free air at atmospheric pressure will at 100° F. hold just 0.002851 lb. of water. The two are equal. In other words the vapor pressure (the weight of water vapor per cubic foot) is the same in the vacuum as in the free air, and, as we have previously shown, it is the vapor pressure that controls the drying or evaporation.

There is obviously a limit to which the temperature of evaporation can be lowered by means of absorption of the water vapor by air. Moreover, the lower this temperature is, the less economy will result from the drying operation because of the large quantity of air that absorbs heat as explained above. Again the entering air has to be sufficiently dry to be efficient in absorbing moisture. The ideal condition of course would be to have the entering air entirely free of moisture but this of course cannot be had. Also if the temperature of the entering air were above the temperature of evaporation the air would then give heat up to the paper and the drying rate would be still further increased but the economy would again be lessened, since a large quantity of heat would be absorbed in raising the temperature of the air.

Vacuum Paper Machine Dryer

Drying paper in a vacuum is a simpler process than drying as practiced today, in consequence of which much more accurate data can be obtained. In a vacuum, the temperature of evaporation must be the temperature corresponding to the vapor pressure which is the amount of vacuum. Theoretically we have a saturated vapor surrounding the paper at the temperature and the pressure of the vacuum being used. Knowing the vacuum the temperature can be found from the steam tables. If the vacuum is 28 in. of mercury, the temperature of evaporation will be approximately 100° F. and the rate of evaporation will be directly proportional to the difference between the temperature of the steam in the dryer and the temperature of evaporation, all other factors being considered equal, such as condition and tension of dryer felt, thickness of dryer shell, oil or grease film on inside of dryer, and surface of outside and inside of dryer shell.

As to Vacuum Drying

In vacuum drying, the rate of drying and the thermal efficiency are absolutely independent of weather conditions since the paper is not dried in the presence of air but in a vacuum and at a temperature which is maintained constant regardless of the outside temperature or humidity. Winter or summer, and dampness or dryness of weather, are not factors in vacuum drying. As the wet paper enters the vacuum paper machine dryer it comes in contact with a heated dryer and sensible heat is passed to the water in the paper thus raising its temperature to the evaporating temperature to the amount of vacuum being carried. The amount of sensible heat is small and in most cases the paper will reach the evaporating temperature before leaving the first or second dryer. From this point on, the rate of evaporation will be constant on all dryers. The paper in making the pass from one dryer to the next will neither take on nor give off heat units, because the temperature of the vapor surrounding the paper in the pass will be the same as the temperature of evaporation.

With the vacuum machine it is possible to regulate the rate and amount of drying very precisely because not only the steam pressure within the dryer, but the amount of vacuum, can readily be changed. By increasing or decreasing the amount of vacuum the drying conditions are instantly changed and no delay is encountered in waiting for the dryer shells to cool off or heat up as is the case in the present type of paper machine dryers. By means of a sim-

ple but effective device, the amount of vacuum can be automatically regulated to within 2/1000 of an inch. It is feasible to connect this control with another device whereby the moisture content of the paper, leaving the dryer will regulate the vacuum. Thus the papermaker may be relieved forever of the uncertainty of how wet or how dry his paper is going into the reel, absolute uniformity of moisture being assured. This makes for a considerable saving as the news papermaker can leave just 10 percent of moisture in his paper and get paid for it. As it is now the papermaker dries his paper below ten percent as a margin of safety because of the fact that he cannot control his moisture per cent very close since his drying is dependent upon weather conditions and since his control of drying temperature is limited to his control of the steam pressure which control has a very considerable lag.

Thermal Efficiency High

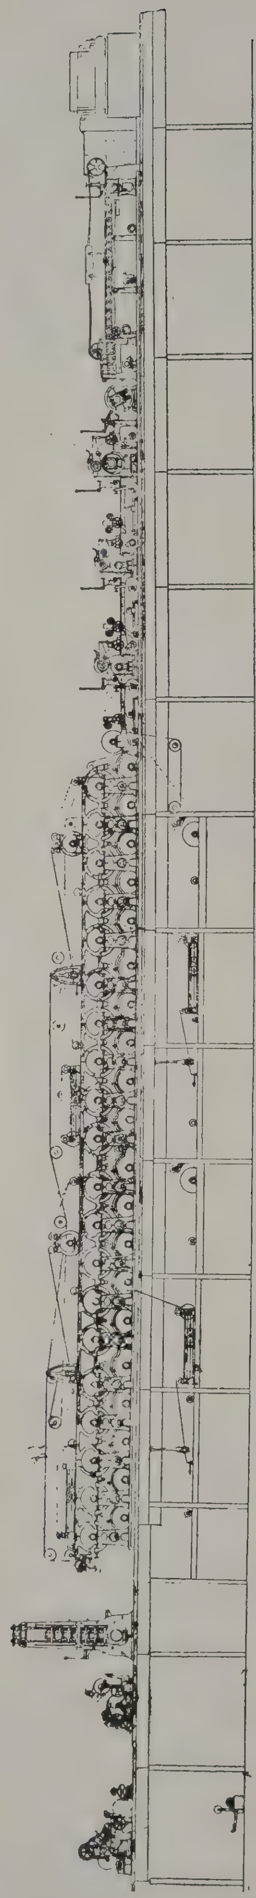
The thermal efficiency of vacuum drying must necessarily be high, almost 100 percent. The dryers being enclosed in a high vacuum (which acts similar to a thermos bottle) only give up heat to the paper which is in contact with them —no air is present to absorb and carry away heat units. If for instance a vacuum of 28 inches of mercury is carried the drying temperature or temperature of evaporation will be about 100° F. and the vapor given off will be at this same temperature. The vacuum case will therefore be at this temperature. If, as occasionally happens on a hot day in summer, the temperature of the air in the machine room should be over 100° F. the vacuum dryer would actually take a small amount of heat from the atmosphere of the room and the machine would be apparently over 100 percent efficient.

Making Calculations

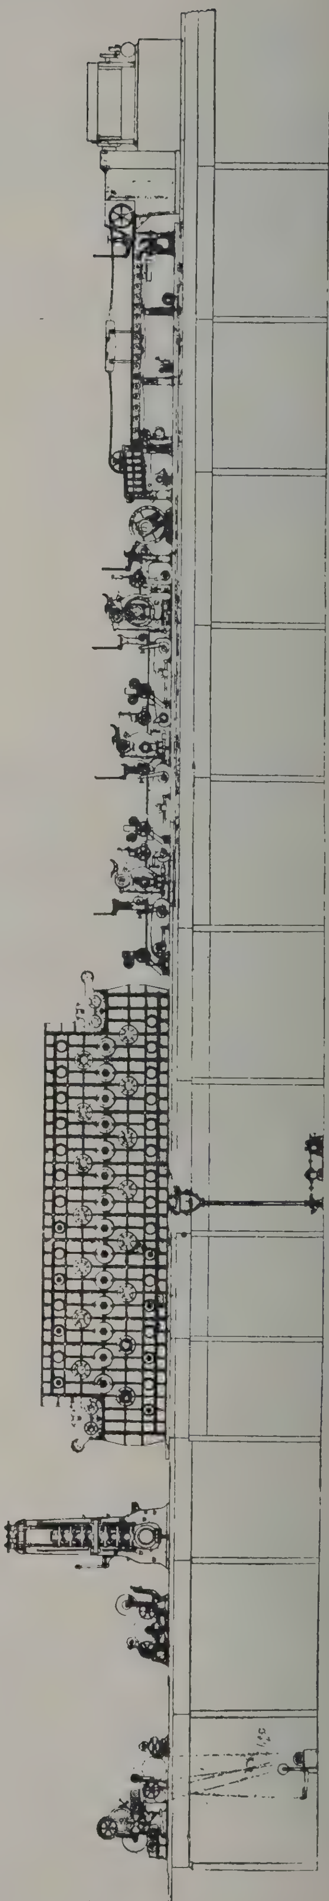
Considerable emphasis above has been put upon the fact that the rate of drying depends on the difference between the temperature of the steam inside the dryer and the evaporating temperature of the water in the paper. In calculating the size and number of dryer rolls this fact is important. If, in designing a new paper machine, the moisture content of the paper and the rate of evaporation of the moisture be known, the number and size of dryers necessary can readily be calculated. Also the theoretical number of heat units necessary to complete the drying process can be determined. In theory these figures, applicable to the vacuum process, can be arrived at with a good deal of accuracy but allowance must be made for such factors as the smoothness of the dryer service, quality, thickness and tension of felts, thickness and material of dryer shells, and surface of inside and outside of dryer. These factors, however, are the same as are met with in atmospheric drying.

Low Drying Temperature Improves Paper

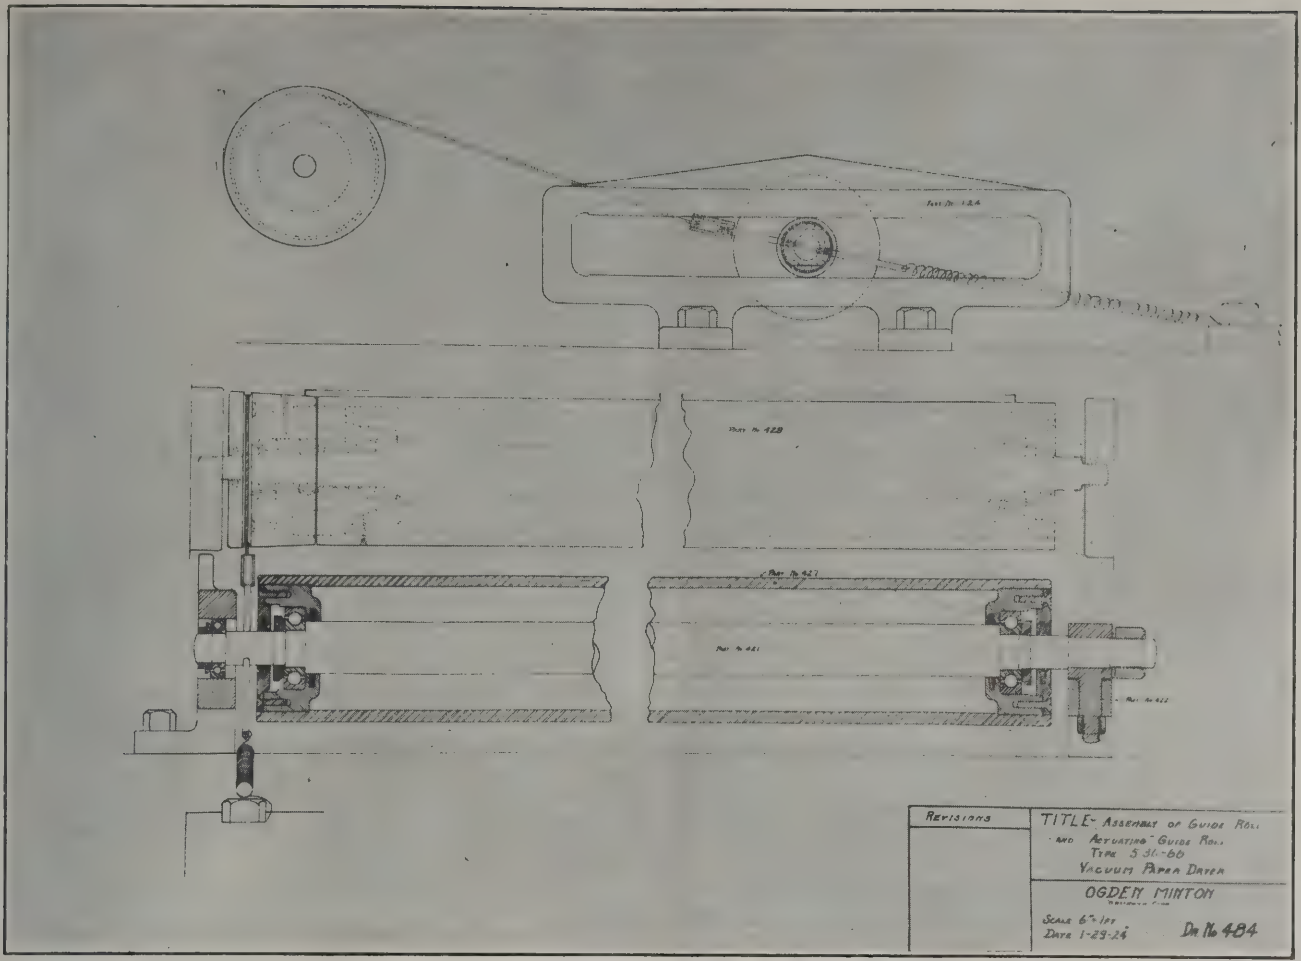
It is conceded by almost all modern papermakers that a low drying temperature improves the quality of the paper in strength, degree of sizing, brightness of colors or tints and the ability of paper to age without turning a brown faded color when exposed to light for any long period of time. When paper is dried in a vacuum paper machine dryer under a vacuum of 28 in. of mercury the paper can never reach a temperature over 100° F. which temperature is no greater than the temperature of some of the hot days of summer. The fibers of paper dried at this temperature are not scorched or burned. The low drying temperature will not turn the size in the paper to starch or fade delicate colors or tints. It is impossible with the data now available to say just how much stronger or better paper will be when dried at this low temperature but in some cases the added strength and quality undoubtedly will be considerable. This is particularly true of paper made of the cheaper grades of stock such as groundwood. Thus the papermaker can use cheaper stock and make the same or a better quality of paper.



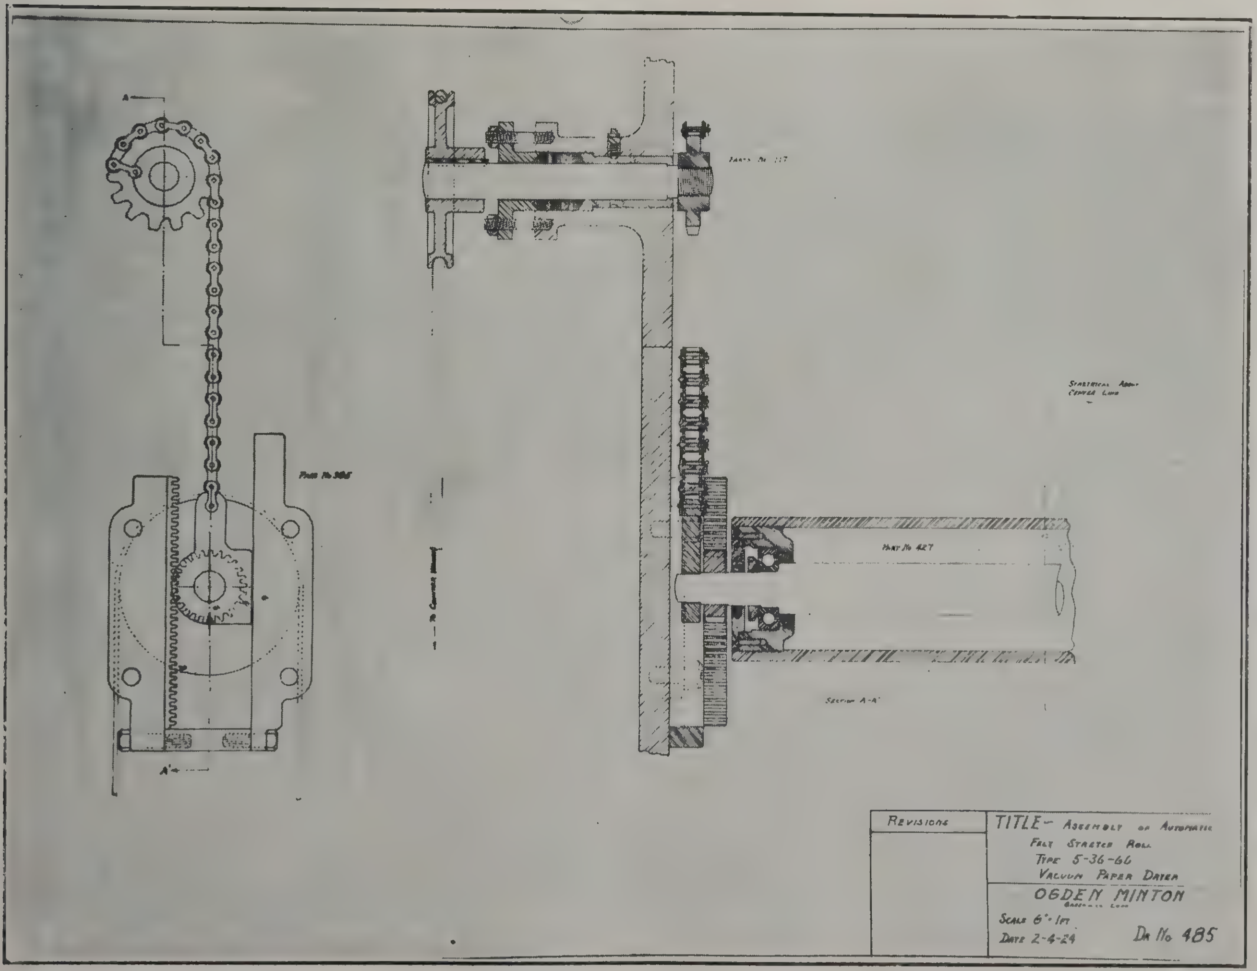
Elevation of Complete High Speed Paper Machine—230 in. Wide of Standard Design



Same Machine as above with Vacuum Driers



Felt Guide Roll—Longitudinal Section



Automatic Felt Stretch Roll

Number of Dryers Required

The number and size of dryers necessary to a drying machine in part depends upon the percentage of water to be evaporated from the paper. In referring to this percentage, 70 percent wet shall be taken to mean that the web contains 70 percent water and 30 percent of bone dry stock. Table I has been prepared to show the quantity of water necessary to be evaporated to produce one pound of paper both bone dry and 8 per cent wet. (Some papermakers work upon a bone dry stock basis and some upon an 8 percent wet stock basis.) Incidentally it may be pointed out that this table shows the importance of having the wet presses perform properly. There is a certain percentage of wetness of stock that is most economical, considering cost of press felts against cost of steam, but this is a percentage that each papermaker must determine for his own particular paper machine in the light of cost of felts and cost of steam.

TABLE I.

Wet water %	Bone dry stock %	Water evaporated per lb. bone dry paper Lb.	Water evaporated per lb. 8% wet stock Lb.
75	25	3	2.68
74	26	2.85	2.55
73	27	2.70	2.404
72	28	2.57	2.294

60	40	1.50	1.30

From tests, the papermaker can determine the percentage of wetness of paper stock going to the dryer. This percentage known, the amount of water to be evaporated to produce 8 percent wet paper can be determined from Table I. For illustration let it be assumed that the paper stock is at a temperature of 65° F. and is 69 percent wet (nearly an average for newsprint.) Table I indicates that 1,972 lb. of water is to be evaporated for each pound of 8 percent wet paper to be made under these conditions. Table No. 1, line No. 2, indicates the temperature of evaporation and line No. 7 the total number of B. T. U.'s necessary to evaporate 1 lb. of water. This latter figure multiplied by the number of lbs. of water gives the total B. T. U.'s necessary to produce 1 lb. of paper. Assuming the paper to be dried in a vacuum paper machine, the calculation is as follows:

Temperature of wet stock..........................65°
Vacuum ....28 in. mercury
Temperature of evaporation ....100° F.
Total B. T. U.s necessary to evaporate 1 lb of water..1070.6

Then from Table I.

Wetness ....69 percent
Water to be evaporated............1.976 lb.

Then 1070.6 x 1.976 = 2,116.50 B. T. U.'s necessary to produce 1 lb of 8 percent wet paper.

The negligible amount of sensible heat necessary to raise the actual paper stock from 5° F. to 100° F. has been purposely disregarded.

Each pound of steam at 5.3 lb. pressure contains 960.0 B. T. U.'s of latent heat which is given up to drying paper.

Then $\frac{2116.50}{960.0}$ = 2.203 lb. of steam at 5.3 lb. which is necessary to produce 1 lb. of 8 percent wet paper with 100 percent thermal efficiency.

Some Mill Data

A vacuum paper machine dryer will very nearly attain the results indicated by these calculations. One of the best known, best managed, and most modern newsprint mills in Canada is understood to use 3.5 lb. of steam per lb. of paper. Its steam costs $0.65 per 1,000 lb. The mill in

question makes 100,000 tons newspaper per year. This data affords the basis for an interesting calculation:

Steam used per lb. of paper....................3.25 lb.
If dried in a vacuum paper machine dryer,
Steam used per lb. of paper....2.203 lb. theoretical
Say 2.25 lb actual
Saving of steam per lb. of paper..............1.00 lb.
100,000 x 2,000 lb steam = 200,000,000 lb of steam

$$\frac{200{,}000{,}000 \times \$0.65}{1{,}000} = \$130{,}000$$

per year saving in steam alone

Practical Considerations

It is an interesting calculation to show the amount of water vapor that has to be absorbed and carried away by means of air from a machine room equipped with two large high speed news machines. Assume a case, and there are such, of a machine room with two machines capable of making 10 tons of paper on each machine every 24 hours. Assume also that the paper going to the dryers of these machines is 70 percent wet, which is a fair figure. Then for every pound of paper made there is (see Table I) 2.07 lb. of water evaporated:

100 tons x 2,000 lbs. x 2.07 = 414,000 lbs. of water evaporated per 24 hours and for the two machines there would be 828,000 lb. of water evaporated per 24 hours. It is no wonder that an elaborate ventilating system is necessary to take care of this amount of moisture, and it is not surprising that heat losses are so great, when considered from this standpoint. The vacuum paper machine dryer will evaporate this moisture at almost 100 percent thermal efficiency and then return practically all of the heat used for evaporation, in the form of water at 90° F. for use in the beaters and flowbox, which in the winter time in a northern mill is an important item.

Savings

In estimating the saving in steam that will be brought about by changing from a standard dryer section to a vacuum paper machine dryer, each individual case has to be considered on its own merits. Some dryer sections are much more efficient than others. In some cases the cost of steam is much less than in others. The percent of saving of steam per pound of paper made is of course more attractive to the mill making the cheaper grades of paper. For if the vacuum paper machine dryer saves a certain amount of money per ton and the price per ton is low, the saving is relatively large, whereas if the price per ton be high the saving in steam would appear of relatively less importance. On any low priced paper such as news, board of various kinds, or pulp the saving in steam alone can be shown to make it profitable for the papermaker to replace his present dryer with a vacuum paper machine dryer. Take for example a news machine making 100 tons of paper per day. We have:

100 tons per day x 300 day = 30,000 tons per year.

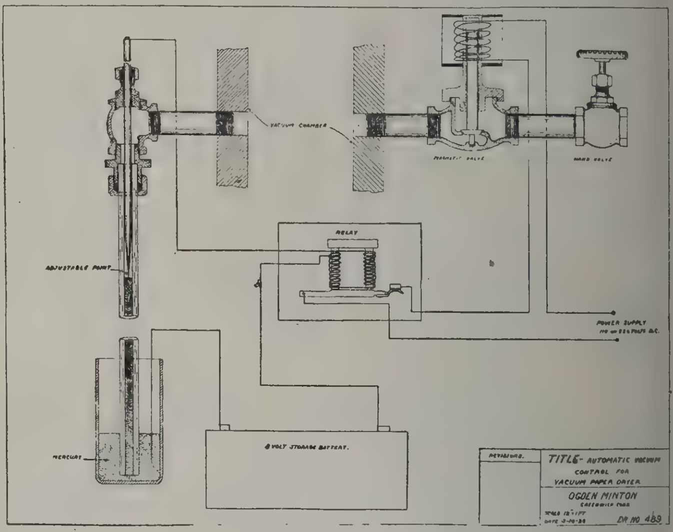
30,000 tons x 2000 lb.=60,000,000 lb. of paper per year. We have shown previously that the saving is 1 lb. of steam per lb. of paper made, and when an average is taken the year around, including winter weather, this figure is very conservative. If steam costs 60c per 1000 lb. which is an average figure for northern mills we have:

$$\frac{60{,}000{,}000}{1000} \times .60 = \$36{,}000$$

saving per year in cost of steam. This is the interest at 6 percent on $600,000,000. An estimate of the cost of a vacuum paper machine dryer for a machine of this type would be under $100,000, showing a considerable saving. Add to this, the saving due to the fact that all of the heat units used in drying the paper are returned in the water at 90° in the hot-well for use in the beaters and the flowbox, which in winter are needed and must be supplied, and the saving in steam per lb. of paper would be more nearly 3 lb. than 1 lb. On a year round average it can be shown that the saving in steam would average close to 2.5 lb. making the saving figure $90,000, instead of $36,000 as shown. In this case the vacuum paper machine dryer would pay for itself in one year. To the above savings there must be added the savings in cost of felts, lubrication, floor space occupied, and the improved quality of paper. This last item will be considerable. More groundwood may be used in the furnish and less sulphite pulp and the same strength paper made. Still there is to be taken account of savings due to lowered power and surely the improved working conditions are an item of considerable value, as in some instances the vacuum paper machine may be operated with fewer men.

Working Conditions

In the opinion of the author one of the best features of the vacuum paper machine dryer is that the machine room will be free from the moisture and heat and the machine so shortened that working conditions will be very greatly improved. The distance from the last wet press to the calendar or reel will seem ridiculously short. Drawing No. 492 shows the comparison of a 230 in. news machine, with standard dryers, and with a vacuum paper machine dryer. This particular machine has a comparatively low temperature of evaporation and the vacuum paper machine dryer is longer and contains more dryers than ordinarily would be the case. Many machine rooms of which the author knows are very oppressive places in which to work on a hot day in summer. The humidity is just about 100 percent and the temperature very high.



Automatic Control for Vacuum

Conclusions

In closing the author would like to add that the results obtained have come about after six years of intensive work on his own part and those associated with him. The development work was of a pioneer nature. Data had to be collected as the work proceeded. Much of this data could not be found in text books and was obtained only after a great deal of original research. Experiments were carefully and scientifically carried out and the results tabulated. All of this required considerable time and a lot of patience and perseverance. The machine design called for careful study as the pressure due to the atmosphere is high and stress and strain diagrams had to be carefully made of all parts. These calculations have been proved and demonstrated as correct in the dryer which has been built and subjected to the most rigid tests. The cost of this work has been large. Many models were made and two full size dryers were built, torn down, and rebuilt several times, before the present perfected commercial type was evolved. An attempt was made, with only partial success however, to keep the work being done from receiving publicity until the perfected dryer was ready to demonstrate its possibilities in a commercial manner.

Dictionary of Papermaking Terms

Names and Terms Used in the Paper Industry—Titles and Definitions of Sizes and Finishes of Paper and Paper Products

A SUBCOMMITTEE of the Committee on Simplifications of Paper Sizes appointed by the Bureau of Standards in 1921, known as Sectional Committee on Definitions, of which Clarence J. West is chairman, has prepared, in collaboration with Fred A. Curtis, formerly chief of the Paper Section of the Bureau of Standards, the accompanying dictionary of papermaking terms, whic was released for publication early in the year. In reprinting the matter PAPER has subjected it to a certain amoun of condensation whereby redundant, foreign and obsolet terms have been eliminated so as to improve the dictionar for reference and consultation by manufacturers.

A

Abrasive Paper. A good grade of manila wrapping paper, in many weights, coated with glue and an abrasive material such as sand, crushed quartz, garnet, emery, carborundum, etc.

Absorbent Paper. (a) A general term representing a class of papers that are spongy, loosely felted and bibulous in character. This class of papers includes blottings, matrix paper, fiber paper and towelings.

(b) A loosely formed sheet for absorptive purposes; stock in the beater is cut quickly with roll down hard and with minimum suction and pressure on the machine; soft rags, soda pulp and cotton linters are used.

Acid Proof Paper. Paper which has been treated to resist the action of acids or acid fumes; paper so treated is generally wood manila, kraft and rope wrapping.

Adding Machine Paper. Machine finished book paper cut into rolls about 2.5 inches wide; used with adding and computing machines.

Address Label Paper. A specially prepared, light-weight, colored flat writing, usually yellow, for use in addressograph machines.

Advertising Stickers. Small pieces of book or writing paper, upon which an advertisement has been printed or lithographed; gummed on one side for adhesive purposes; generally a gummed label paper.

Air-Dried Paper. Paper which, having been immersed in a tub of a solution or emulsion made of animal hide cuttings glue, starch, tapioca flour, Irish moss, or other vegetable substances, and passed through squeezing rollers, is, in a continuous web, carried in festoons, hung over moving slats or carried over a series of driven revolving carrying rolls or carried over a series of revolving slatted drums and dried by circulation of air, controlled as to temperature and humidity, while subjected to more or less tension; subsequently wound again into rolls before finishing.

Album Paper. Cover paper made in solid colors, particularly in black and gray; designed primarily for making up albums for photographers. A soft surface which will take paste without cockling is essential; it must be free of impurities which would discolor the print.

Alkali-Proof Paper. (a) A paper which has been made or treated to resist the corrosive action of alkalis. (b) Paper that is specially dyed with colors that are not affected by alkalis.

Amber Laid. Referring to a laid sheet of amber color. However, a laid paper is made in other colors than amber.

Angle. A term used to denote the shape or angle of a sheet cut to special shape, such as envelope papers. An English term.

Animal Sized. A term applied to any fine paper, sized with gelatin or glue, either in the beater or tub-sized; in general only high grade writings, bonds, ledgers, etc., are animal-sized. The purpose of the operation is to improve the quality of the sheet as to strength, ink resistance, writing surface, erasing properties, etc.

Announcement. Fine stationery of various qualities and finishes; made of rag and chemical woodpulps.

Anti-Acid Manila. A strong manila wrapping paper, specially treated to resist the action of acids; sometimes used for insulating purposes. See Acid-proof paper.

Antiquarian. A size of paper 31 by 53 inches.

Antique Book Paper. Book paper, possessing bulk and with an unfinished or uncalendered surface.

Antique Cover Paper. Uncoated paper, possessing bulk and with an unfinished or uncalendered surface.

Antique Finish. Paper, not highly finished and possessing bulk and "tooth"; a soft bulky pulp such as soda pulp, and soft rags, are often used; finish obtained without the use of the machine calenders. The term is generally applied in connection with book, cover and drawing papers and bristol board.

Anti-Tarnish Paper. Papers made of sulphite, sulphate or jute; they are used as wrappers to keep a metal enclosure from rusting or tarnishing; generally kraft, wood, manila or tissue. Sometimes a waxed paper. The paper must be free from sulphur compounds, acid and alkali.

Anti-Tarnish Tissues. Wrapping tissue paper used for protecting polished metal goods; is supposed to be free from any chemicals that produce a tarnishing effect on silver, brass, etc.

Appearance. The effect upon the sense of sight, resulting from observation of the color, finish and formation of papers, cardboards or boards.

Art Covers. Special decorative cover paper, used for announcements, greeting and valentine cards and the like.

Artificial Leather. Paper having the appearance of leather; made of rope, leather clippings or duck cloth, then treated and embossed; used as a cover paper, for covering books, upholstering furniture and finishing the insides of automobiles.

Artists' Illustration Board. High grade pasted bristol, solid or filled, especially finished and suitable for pencil drawings, pen sketching or water color work.

Art Paper. Double coated book paper, with a highly polished surface; used for printing from fine screen halftone cuts; an English term seldom used in the United States.

Atlas Paper. Paper suitable for printing, engraving or lithographing maps and atlases.

Asbestos Paper. Building papers mad wholly or principally of fibrous asbesto and used as a preventative against fir and for insulating purposes.

Atlas. A size of paper 26 by 36 inches.

Automobile Storage Bags. Large, speciall constructed bags made of sulphite, sulphate or rope stock; used as a coverin for automobiles while in storage.

Automobile Tire Rolls. Paper wrapper for tires; used by manufacturers for protecting individual tires; usually kraf paper in rolls 2 to 10 inches wide, 8 to inches in diameter.

Azure Laid. Writings of a particular shad of blue; made of soda, sulphite and rags a laid dandy roll is used, in imitation o the laid or chain used in making hand-made paper.

Azure Wove. Same as azure laid withou the laid mark.

B

Backing Boards. A term descriptive of a board, made of pasted chip (mixed pape stock); used for backing mirrors or furniture and for partitions between drawer in furniture to prevent dust from goin from one drawer to another.

Backing Paper. Papers which strengthe the flong or mold of alternated sheets used as a mold for stereotype work; the paper must paste down easily; it is generally brown in color.

Back Lining. A paper glued to the backbone of sewed books to bind better the signature and to keep the backbone of the book proper free from the backbone of the cover.

Baggage Tags. Strong manila or colored tag, made with eyelet, generally used for identification of personal baggage, while en route or in storage; the kinds of papers used are document manila, tag board, tough check, etc.

Bag Liners. A general term applied to paper used within bags for additional protection to the contents; the chief requirement is that the paper shall be strong enough for that purpose.

Bag Paper. Paper commonly used for making bags; the chief requirement is that it shall be strong enough to carry the contents of the bag; the kinds of paper used are tissue; bogus manila, glassine, kraft, paraffin, rope, vegetable parchment, wood manila, sulphite wrapping, etc.

Baking Cups. Specially constructed cups, made of sulphite wrapping paper and sometimes used as a liner for baking utensils.

Baling Paper. Any heavy paper used for covering bales to protect contents; may be reinforced with cloth fabric (cheese cloth) which is pasted to one side after it has been coated with asphalt, or it may be crinkled, corrugated or treated with asphalt.

Bandage Paper. Absorbent paper, similar to toweling, and generally crinkled. It is used for bandaging and is generally made of bleached sulphite pulp.

Bank Note Paper. A strong durable and pliable bond paper, made of cotton and linen rags and used for currency purposes.

Banks. **(a)** High class machine writings, which are very strong and thin; made of rags or chemical woodpulps. **(b)** A high grade bond paper, somewhat resembling bank note paper.

Barber-Dried. Indicates a method of drying paper; after tub-sizing the moist paper is passed over small solid revolving rolls, festoon fashion, permitting of modification and control of tension, and dried by means of heated air; from the name of inventor.

Barber's Head Rest Paper. Paper, in rolls, used in connection with barber's chairs; usually cheap machine-finished book, news or an absorbent paper resembling toweling.

Barrel Liners. Papers used to line barrels; the chief requirement is that the paper shall be strong enough to carry the contents; it may also be crinkled or creped to conform more nearly to a standard size barrel; it may also consist of two layers of creped kraft with a layer of asphalt between.

Basis Weight. A term used to indicate the weight of an individual sheet of paper, in terms of the weight of a ream of that paper; the unit of basis weight is the pound and the standard ream size should be 25 by 40 inches. The sizes of different classes of papers on which basis weights are now dependent are as follows:

Book	25 x38	500
Bristol	22.5x28.5	500
Cover	20 x26	500
Writing	17 x22	500
Blotting	19 x24	500
Tissue	20 x38	480
News	24 x36	500
Wrapping	24 x36	480

Beaming Paper. A water finished kraft used in the manufacture of silk. Made in 24 by 36, 480, from 140 to 200 pounds.

Bedstead Wrapping Rolls. Rolls of 30-lb. kraft or waxed paper, 2 to 4 inches wide and 3 inches in diameter, used for wrapping brass or iron beds for shipment and storage.

Beer Plaques. A combination or solid chip board, usually lined, printed and cut into plaques for display and for advertising purposes.

Bells, Paper. Bells made of white or colored tissue paper, formed into bell shapes and used for decorative purposes.

Berry Boxes. Boxes of specified capacity, made of hard-sized single manila-lined chip board.

Berry Pails. See Berry Boxes.

Bible Paper. Light weight opaque printing paper, in which strength and opacity are the chief characteristics; special care is given to the preparation of the stock; rags and chemical woodpulp are used, as well as a large proportion of special filler; used originally for bibles; generally basis 30 pounds or less in weight.

Bill Paper. Writing or bond papers, suitable for commercial bills, statements, notes, bills of exchange, acceptances, etc.

Bill Straps. A general term applied to strips of paper used to fasten currency notes into packages, sometimes colored to denote different denominations of bills; the kinds of paper used include kraft or manila wrapping, bond or ledger paper.

Billing Machine Paper. Flat writings or bond papers, suitable for use on billing machines; sometimes in rolls, using several colors with carbons. Chemical woodpulp generally used.

Binder Board. Cloth board, made from mixed papers and low grade rags; used for book covers.

Binding, Lantern Slides. Passe-partout or gummed black cloth for covering the edges of glass lantern slides.

Biscuit Caps. An English term applied to thin white machine glazed papers used for making various sized bags for confectionery and similar trades.

Biscuit Paper. Paper used to wrap cartons and to line boxes of biscuits; light weight sulphite or kraft paper, either machine glazed or finished on both sides, is used as well as a decorated machine glazed paper.

Black Line Paper. Paper for reproducing line drawings, etc., in such a manner as to produce the lines in black rather than in white as is the case with blue and brown print paper. A well made writing paper is chemically treated to reproduce the drawings.

Black Photo Paper. Cover paper for photographic purposes; generally duplex and made of black stockings; used for protection of camera films.

Black Wrapping Paper. See Black photo paper.

Blank Book Paper. A paper suitable for use in the manufacture of blank books; book, flat writings, bonds, ledgers, news and No. 2 manila are used according to the grade desired.

Blankets, Paper. Large sheets of paper for covering purposes; sometimes waterproofed to resist moisture; wood manila and vegetable parchment are used.

Blanks. A group of cardboards which may be coated or uncoated, pasted or non-pasted, made in standard thicknesses with white or colored liner, the middle being of a different stock from that of the liner.

Blasting Paper. Paper used by miners for making a container to hold black powder, when put up in narrow width rolls, 6 or 9 inches wide, weighing 4 to 6 pounds to the roll; an extra heavy drab water-finished wood manila or sulphite wrapping paper is generally used.

Bleached Manila Lined Chip Board. Box board with good bending quality; made with chip base (mixed papers), with a bleached manila liner (manila clippings bleached); used principally for folding.

Blotting Paper. A paper used chiefly for absorbent purposes; blotting papers are generally used for absorbing ink or for conversion by chemical processes.

Blue Print Paper. Paper for sensitizing for use in sun or photo copying; light to medium substance; hard, sized, tub-sizing with animal gelatin preferable, surface firm, to be little affected by moisture; fibers long and flexible, to give good folding and wearing qualities, and strong when wet; finish smooth, not slippery, to insure even spread of solution; free from chemicals detrimental to the sensitizing solution, particularly those of an oxidizing nature; now made in many grades, more or less true to type may be treated with other solutions to print colors other than blue.

Boards. Papers made on a multicylinder or wet machine principally from waste paper, woodpulp, straw and cheap rags; the chief characteristic of this class of papers is rigidity or stiffness and they are generally heavier than the other classes of paper.

Bogus. **(a)** Wrappings and cardboards; denotes contents to be of inferior or low-grade stock. **(b)** Denotes re-manufacture from old papers, producing a sheet of similar characteristics, but generally having less strength and varying in appearance when used singly; generally understood to be made of No. 1 mixed papers.

Bogus Bristol. Cardboard made of over-issue news, or mixed papers with a white or colored liner on each side, sometimes vat-dyed, in most cases calender stained, used for tickets and advertising.

Bogus Manila. An inferior grade of manila paper, generally of old manila papers re-manufactured. Also frequently applied to a rag or bogus paper which has a yellowish tint.

Bogus Wrapping. Coarse cheap wrapping paper, usually gray in color and having little strength; made from mixed papers; also known as rag wrapping, gray rag or gray wrap; used for wrapping when covering, not strength, is essential.

Bonbon Cups. Small receptacles, made in the form of cups, of sulphite bond or ledger paper.

Bonds. Writing paper of light to medium substance made on fourdrinier machine; hard-sized, either tub or engine; may be loft, air or machine dried, carrying moderate glazed or unglazed (dull) finish; closing pebbled to obliterate open or cloudy formation incident to long fibers; originally designed for uses when strength and durability are essential, such as government bonds, legal documents, wills, life-insurance policies, etc. Now made in many grades, fairly true to type, to meet more general needs, particularly in commercial work, such as letter heads, business forms, checks, etc. (May be all rag, mixed rag and chemical pulp or all sulphite pulp.)

Bookkeeping Machine Paper. Usually an all-sulphite sheet, sold in rolls for use in different sorts of bookkeeping machines. The size of the rolls is perhaps the most distinguishing feature.

Book Lining. **(a)** A book paper, either machine finished or super-calendered; used to line strawboard or chipboard. **(b)** Used as a fly leaf, half of which is pasted to the cover of the book; it is also called case lining when the covers of books are called "cases."

Book Paper. Uncoated printing paper, made of various finishes and generally used for printing books and magazines. (May be mixed soda and sulphite, or re-manufactured paper.)

Book Wrapper. Paper used to wrap books of any description for protection; may also be applied to printed book paper, used as covers on novels; usually made of sulphite wrappings.

Boot Board. Especially hard boards, prepared from mixed papers or long fiber; used for the insoles and heels of shoes; frequently toughened by addition of pulped leather clippings.

Bottles, Paper. Bottle-shaped containers made of heavy waxed stock or pulp board; made in standard half pint, pint and quart, with round bottom to conform to requirements of milk bottle filling machines; used for milk and cream only.

Bottle Wrapping Paper. Paper used for wrapping bottles to prevent breakage and to avoid exposure to light. In some cases the sheet is clipped or stamped to hold its shape; generally an indented wrapping paper with either fine or coarse indentation; sometimes a cheap tissue.

Bottle Caps. Paper disks made of mechanical pulp and sulphite (pulp board), used as crowns or covers for milk bottles; stock similar to that used for paper milk bottles; usually waxed or paraffined.

Bottle Packing Paper. A wrapper suitable for packing bottles in cases or cartons; usually an indented chip, or strawboard to provide a cushion for the protection of the bottle.

Bowl Paper. An English term referring to paper suitable for the manufacture of calender rolls.

Bowls. An English term applied to calender rolls when made of paper. See Calender roll paper.

Bow-Wave Finish. A fancy two-toned ripple finish in stratum formation, produced by a plater.

Box and Barrel Layers. A pulp or chipboard, used as separators between layers of different commodities packed in boxes, barrels or other shipping containers.

Boxboard. Boards made on a multicylinder machine and used in the manufacture of paper boxes and cartons; may be made of mechanical pulp, sulphite, sulphate, straw or mixed paper stock.

Box Cover. Light-weight decorative cover paper, used for covering and decorating boxes; usually lighter in weight than ordinary cover paper; may be coated. See Box enamel.

Box Enamels. White or colored coated paper; used for covering boxes; coated on one side only and very highly glazed.

Box Stay. A narrow strip of strong rope, kraft or wood minila paper, gummed on one side; used to reinforce the corners and edges of paper boxes; sometimes cloth lined.

Bread Labels. Small labels, made of book paper, printed or lithographed; used as distinguishing mark on bread or bread wrappers.

Bread Wrappers. Sheets of light weight wrapping paper almost always waxed and in two styles. **(a)** Self-sealing and **(b)** so-called "dry" waxed. In the case of paper of class **(a)** the paper is so waxed that the major portion of the wax lies on both surfaces of the sheet, so that when two sheets are pressed together and heated the surface wax melts, causing the sheets to become sealed together. Papers of class **(b)** are so waxed that the major portion of the wax is driven into the interior of the sheet and the paper feels dry. This class of wrapper must be sealed by adding melted wax, as the wrapping is being done. Practically all bread wrappers are printed before they are waxed.

Bright Enamels. An English term applied to enameled or coated papers, coated on one side only; finished with a high polish produced by calendering and brushing; used for labels.

Bristols. Certain types of cardboard of six one-thousandths of an inch in thickness or more; made either on a fourdrinier or multicylinder machine; usually made solid but may be filled; three classes of bristols are generally recognized, fourdrinier bristol, cylinder bristol and wedding bristol; the last being a pasted sheet.

Brown Print Paper. A paper treated with chemicals sensitive to light to reproduce, in brown and white, drawings or sketches.

Brush Finish Coated Paper. A kind of paper, coated on one side, either single or double coated, used principally for cigar labels; the brushing of the coating previous to the calendering produces a smooth, even and more brilliant surface.

Browns. An English term referring to brown wrapping paper such as rope browns, air-dried, cylinder-dried, etc.

Brush Matrix. A matrix mat, molded by being beaten over printers' type with a stiff bristol brush. See Matrix paper.

Buckskin Board. A cheap inferior board, made of mixed papers, old rags or kraft pulp on a multicylinder machine; used for automobile panel boards and chair seats. See Cloth board.

Buff Printings. An English term referring to buff colored printing papers.

Buggy Board. A heavy board or pasted chip, made of mixed papers; used for backing in buggy seats and, when covered with leather, for dashboards. See Cloth Board.

Building Paper. A class of thick, bulky papers made of old stock (rags, wool, mixed papers, etc.) and sometimes mixed with asbestos, used in general construction work; may be converted into such products as roofing and tarred felt, etc.

Bulk. A term applied to designate the thickness of a specified number of sheets of book paper.

Burlap-Lined Paper. A waterproof sheet, made of kraft wrapping, about eighty pounds in weight, coated on one side with asphaltum over which ordinary burlap of 4, 6, 8 or 10 ounces weight is placed; used as a wrapper of great strength for hides, leather, machinery, etc.

Butchers' Manila. A kind of yellow-tinted-manila wrapping paper, made of mechanical and sulphite pulp; well-sized; used for wrapping meat; paraffined or oiled paper is sometimes used for the same purpose.

Butchers' Wrapping. See Butchers' manila.

Butter Cartons. Boxes for holding butter; made of white patent-coated solid manila or of solid manila and single manila-lined chipboard; usually waxed or paraffined.

Butter Dishes. Tray-shaped receptacles, made of waterproof chipboard; used by retail grocers to hold butter or lard delivered to customers.

Butter Paper. Paper used for wrapping butter, lard or similar greasy material; paper must be greaseproof; generally a vegetable parchment.

Button Board. Vulcanized or hard fiber used in making buttons; cut to special shapes and covered with cloth. This term is sometimes used for button card.

Button Card. A light-weight bristol, white or colored, plain or coated, used to sew buttons on for display and merchandising.

C

Cable Paper. Paper used for wrapping cables for insulation and protection; after wrapping, cable is sometimes covered with cloth and varnished; a strong manila or kraft is generally used.

Cake Board. Pulp board, single manila lined chip board, or patent coated board, used to place cakes on after baking; also as layers between rows of small cakes shipped in bulk.

Cake Boxes. Boxes made of solid manila board, or single manila lined chip; used for protecting cakes.

Cake Circles. Disks cut out of white sulphite bond paper and used in cake-making at the bottom of a pan.

Cake Laces. White sulphite bond paper, cut on edges to resemble lace designs; used for ornamental purposes in serving sweets or cakes.

Calf. A more or less embossed paper, colored to suit fancy to imitate leather; used for bookbinding. See Artificial leather.

Calendered Paper. Any paper with surface glazed by means of calenders; does not include plate-finished but refers to machine or English finished, supercalendered, friction glazed, etc. May be sheet or web calendered.

Calender Roll Paper. Soft paper made of rags, wool or flax waste, used for the manufacture of calender rolls; cut into disks and bolted together under high pressure, then turned on a lathe and polished. Sometimes called bowl paper.

Cambric Paper. Writing paper impressed with a design resembling cambric cloth; produced by plating; used for correspondence.

Cambridge Bible Paper. Trade name for a grade of bible paper; originally referred to the paper used in the Cambridge edition of the Bible.

Camerograph Paper. A sensitized paper used in the reproduction of records.

Candle Paper. Bogus wrapping or chipboard about 14 to 16 points in thickness; used in the manufacture of Roman candles and fireworks.

Candy Bags. Small bags, usually made of white laid sulphite bond; also made of specially strong white laid book; used in retail sale of candy.

Candy Pails. Pails or buckets, the larger sizes of which are made of solid fiber container board; small size pails made of patent coated or single manila lined chipboard; used as containers for candy.

Candy Wrappers. See Candy paper.

Canisters, Paper. Receptacles or cases of chipboard, strawboard or manila lined chip; used as a substitute for tin cans.

Cans, Paper. See Canisters.

Cap. An abbreviation for foolscap; also refers to a size of writing paper, 14 by 17 inches.

Cap Board. Board suitable for use as caps for bottles; made of mechanical pulp and sulphite. See Bottle caps. See Cap stock.

Caps, Paper. A manila or rope paper, used in the manufacture of paper caps for use in toy pistols. Also see Bottle caps.

Cap Stock. **(a)** Plain straw cap stock, made of well-sized strawboard. **(b)** Colored cap stock, made of a straw base, one side vat-lined with colored manila made of manila clippings. See Cap board. See Bottle caps.

Carbolic Paper. A paper impregnated with stearin and carbolic acid; used as a special wrapper.

Carbon Paper. Tissue of 4, 5½, 7 and 10 pounds weight (20x30, 480) coated with carbon and some oily or wax medium; used with pen or pencil or typewriter for making duplicate copies; may be coated one side or both; may be colored black, blue, purple, etc. Coated two sides used for sales books; lighter weights, coated on one side, used for varying numbers of copies, the lighter weight being used when a large number of copies is desired.

Carbon Tissue. Tissue paper of 4, 5½, 7 and 10 pound weight (20x30, 480), of close texture, smooth surface, free from pin holes and used principally as the basis for carbon paper. This paper is generally made of rags, manila and jute or sulphite.

Carborundum Paper. See Abrasive paper.

Cardboard. Heavy papers (bristols and blanks), made on fourdrinier or multicylinder machine or by pasting two or more plies together, either by hand or machine, and may be coated or uncoated. The characteristics of these papers are that they are generally stiff, relatively thick, and are suitable for various kinds of printing or engraving.

Card Index Bristol. See Index bristols.

Card Middles. A cheap board, used as a filler in making cardboard; may be made of mechanical pulp or of over-issue news; also used for gaskets on tin cans.

Cards. Cardboard cut to small sizes for commercial use. See Index bristol. See Wedding bristols.

Car Lining. Wrapping paper used by millers, grain dealers, salt companies, etc., to line or cover the bottom and sides of box cars to prevent leakage; applicable to any grade used for this purpose.

Carnival Novelties. Paper articles, made of white and colored light-weight paper, usually tissues, for use at carnivals and festivals.

Carpet Felt. See Carpet lining.

Carpet Lining. Soft, thick and spongy building paper, plain or indented, used for inserting between floor boards and carpets.

Carpets, Paper. Rugs or carpets woven from sulphite and kraft wrapping paper which have been cut into narrow strips, twisted into twine, stained and waterproof.

Carpet Yarns. Yarn or twine made of light-weight kraft and sulphite paper; produced by cutting rolls to narrow widths and twisting as twine, stained and waterproof. See Carpets, paper. See paper yarn.

Carriage Panel. Heavy cloth board, used for roofing railway and other cars and, to some extent, for automobile parts.

Carry Bags. A bag made of strong wrapping paper, with handle, for use in carrying small purchases of merchandise; generally of rope, manila or kraft paper.

Car Sign. A coated cardboard; usually refers to a special size of 22½ by 42 inches; commonly used for street car advertising. See Railroad board.

Carton. **(a)** A container, with cover attached, made of patent coated, good bending quality of board, or manila lined chip. **(b)** A container, with cover attached, made of jute liner and corrugated strawboard or of solid fiber container board. Used for packing, shipping and storage of small articles.

Cartridge Paper. **(a)** Manila wrapping paper, from 50 to 80 pounds in weight, sometimes waxed on one side; used as containers for dynamite or other explosive material. **(b)** A three-ply paper, pasted in a particular manner and used to make shotgun shells.

Cash Register Paper. Small rolls made of white book, writing or bond paper; used in connection with cash registers to indicate data in regard to sales.

Case Lining. **(a)** Kraft or bogus manila wrapping of 20 or 30 pound stock, single sheet coated with asphaltum, duplex sheet coated in center, and single sheet coated and backed with cotton fabric; used for the protection of contents of wooden shipping cases or for the protecting of machinery, electrical apparatus or other metal goods against moisture. **(b)** A general term to designate a paper used for lining cases to protect the contents; applicable to any grade used for this purpose. See Waterproof wrapping.

Cash Sales Pads. Small blocks of paper, with printed form; used by merchants for records of sales; may be made of newsprint, book, writing or bond paper, in various colors and weights.

Casing Paper. Paper used for lining shipping cars. See Case lining.

Cassie. A term used to describe the few outside sheets of a ream of good paper, from the French **casser,** to break or waste.

Catalog Envelopes. Envelopes made of manila, kraft or white paper of size suitable to enclose pamphlet or catalog.

Catalog Newsprint. A kind of light-weight newsprint; used principally for directories and mail order catalogs.

Catalog Paper. A light-weight opaque printing paper or newsprint, made of sulphite and soda and sometimes mechanical pulp; used principally for mail order catalogs and directories; better grades, even up to enamel papers, are used for special catalogs requiring the use of fine screen cuts.

Cellophane. A product, made of a specially treated paper or pulp, somewhat resembling glassine; made from a bibulous waterleaf similar to that used for artificial silk or vegetable parchment.

Cellucotton. A trade name for a crinkled or creped, unsized pulp or tissue; run over a roll to a desired thickness and cut into small packages of desired sizes; used as a substitute for absorbent cotton.

Cellular Board. Corrugated strawboard with liner of chipboard on one or both sides. See Corrugated container board.

Cement Sack Paper. A heavy rope, jute, kraft or sulphite wrapping paper, made to possess unusual strength; used in the manufacture of bags for cement, lime, etc.

Chain Mark. One of the wider parallel lines of a laid watermark. See Laid.

Chair Seat Board. A sulphite (Mitscherlich) pulp board, highly compressed to give rigidity; suitable for seats in chairs, etc.

Chalk Overlay Paper. Heavy, hard-surfaced paper, coated with chalk and used by pressmen in making ready halftones.

Charcoal Drawing Paper. Light-weight laid, rough-finished drawing paper; used for charcoal sketches.

Charcoal Kraft. Strong kraft wrapping paper; used in the manufacture of bags for holding charcoal.

Charlotte Russe Caps. Receptacles for various desserts; made in cup form, of white lined board or heavy sulphite bond.

Chart Paper. Writing paper which is firm, closely knit and hard-sized; medium to heavy substance; stock thoroughly beaten, without excessive hydration, to avoid excessive stretch under changing climatic conditions; surface smooth without gloss; good erasing quality; suitable for pen and ink charting, duplicating and lithographing.

Check Book Cover. Lined board of various grades, used as a cover for checks; a cloth-covered tag board is often used for this purpose; a tag board with one liner of imitation leather, embossed, is also used.

Check Folio. A size of paper 17 by 24 inches.

Check Paper. Writing paper in light tints of a variety of colors; wove; high finish; peculiarly adapted to lithographic printing of checks and similar forms; may or may not carry "safety" feature.

Check Royal. A size of paper 19 by 26 inches.

Chemical Fiber Paper. A paper made entirely of chemically prepared woodpulp.

Chemical Filter Paper. A specially prepared filter paper for analytical work; made from selected stock and carefully washed with hydrochloric and hydrofluoric acids.

Chemical Manila Writing. A manila writing, made from chemically prepared wood fiber in place of hemp fiber. See Railroad writings.

China Board. See Thick china.

Chest Protector. A device worn on the chest as a protection against cold; made of strong manila wrapping paper of heavy weight, cut to suitable shape and size.

Cheviot. A light-weight, decorated cover paper for covering and decorating boxes.

Chip Board. A cheap board, made on a multicylinder machine from mixed papers; may be combination (filled) or solid. **(a)** Combination chipboard is a board having a chip base or center and lined on both sides with a higher grade of stock and possessing a smoother surface. **(b)** Solid chipboard is a board made entirely from mixed papers with no liner or coating.

Chip Filled. A board having a chip base or center and lined on both sides with better stock and with a better surface.

Chip, Solid. A board made entirely of paper stock or mixed papers, on a multicylinder machine.

Chip Stock. Pulped mixed papers, used for chipboard and various combination boards; pulp not chemically treated.

Chocolate Dividers. Heavy, solid newsboard, colored chocolate; used in the packing of candy, as dividers between layers.

Chocolate Layer Board. See Chocolate Dividers.

Chop Holders. Decorative wrappings of novelty paper, generally white; used for garnishing the bones of lamb or mutton chops, etc., when served.

Chromatic Paper. A mottled paper used chiefly as a cover paper.

Chromo Paper. A heavily coated printing paper, used in chromo-lithographing; the surface is somewhat dull and more absorbent than an art paper.

Cigar Boxes. Boxes made of pasted chip, binders or jute board, for cigars; may be made of solid mill bristol.

Cigarette Tissue. Tissue paper which is unsized, of close texture and free from pin holes. Generally made from rags or ramie, and used principally as a wrapping for tobacco in the manufacture of cigarettes.

Cigar Holders. Containers or holders, made of heavy manila, sulphite bond or board into a form suitable for carrying and protecting cigars.

Cigar Label. A brush-finished coated paper used in the manufacture of cigar labels.

Circles. A term used to apply to paper, cut in the form of circles.

Clay Coated Manila Board. A manila combination board, coated one or both sides with clay, colored or white.

Cloth Board. A heavy cheap solid board, made on a wet machine from mixed papers and low grade rags, with or without the addition of tar; rigidity and compactness are important factors in the quality of this kind of board.

Clothing Box Board. A board, made of mixed papers, or mixed with sulphite or kraft pulp for additional strength; used for boxes for clothing and suits.

Cloth Lined Paper. Any paper backed with cloth; a high-grade coated paper, backed with strong cloth; used by overall manufacturers for tagging and for maps and tickets where strength and resistance to wear are essential.

Coarse Boards. A term used for certain grades of boards to distinguish them from higher grades, known as bristols and cardboards.

Coated. A term applied to any paper, board or cardboard to which has been applied a coating of any character or substance.

Coarse Papers. A term used for certain grades of papers to distinguish them from the higher grades, known as flats, bonds, ledgers, book and cover paper; usually applied only to wrappings and tissue.

Coated Blanks. Coated cardboard, pasted or unpasted, made in standard thickness with white liner and middle of different stock from that of the liner; used for all kinds of printing and lithographing work for calendars, cutouts, advertising cards, etc.

Coated Boxboard. A high-grade patent or clay coated board, for folding boxes; with a news, manila or white back; also solid manila.

Coated Cover Paper. A kind of cover paper on which a coating of clay has been applied by means of glue or casein; may be dull or high finish.

Coated Litho Blanks. A mill blank, made from mechanical pulp or over-issue news, lined on both sides with book paper and then clay coated on one or both sides and given a high finish by calendering.

Coated Paper. A general term applied to any paper to which a coating has been applied, such as coated book, cover, metallic paper, etc.

Coated Printing Paper. A term indicating a group of papers on which a coating of clay, or other similar mineral material, has been applied, using glue or casein as an adhesive generally; either dull finish or highly glazed by means of supercalenders.

Coated Cover Paper. A cover or body paper, made with good folding qualities and usually made of varying quantities of rags and sulphite pulp; suitable to having applied thereto a single or double clay coating on both sides.

Coating Paper. Print paper, made of mechanical pulp, pulp from old magazines, sulphite, soda and rags. Also called backing paper when used for wall paper and paper coated one side; used as a base for coating.

Cockle. The pucker naturally or artificially produced in paper during the drying process.

Coffee Bags. Heavy strong bags of manila, kraft or sulphite wrapping; made in special shape for use in packing coffee in small lots; bags are usually lined with glassine, parchment or paper impervious to moisture in order to retain the flavor of the coffee.

Colletype Printings. An Eglish term applied to thick papers or boards, made of rags or a mixture of rags and esparto; surface generally a little rough; must be fairly hard sized to resist the damp surface of the jelly used in printing.

Combination Board. Boards made of more than one grade of beater prepared stock in one process of operation; vat-lined and clay-coated boards are included in this group.

Combination Boxboard. See Combination board.

Combination Cardboard. A cardboard, made with a center or filler of material inferior to that appearing on the surface.

Commercial Blottings. An absorbent paper, made from soft cotton rags, cotton linters or soda pulp; stock beaten quickly with sharp tackle; this kind of paper may be absorbent on one or both sides.

Commercial Tissues. Grades of tissue paper used for general commercial wrapping purposes; distinguished from tissues prepared and used for special purposes.

Computing Machine Paper. See Adding machine paper.

Commercial Writings. Writing papers commonly used in ordinary business transactions and for advertising purposes, as distinguished from specially made or prepared fine grades for specific uses or for conversion into finished articles for resale.

Condenser Paper. A light-weight tissue, made from cotton or linen rags or sulphite; free from pin holes and electrically conducting particles; about 0.0005 inches thick; used in electrical condensers.

Cones, Paper. **(a)** A drinking receptacle of tag board or ledger paper, waterproofed; used at soda fountains. **(b)** A cheap chipboard; made up into the form of cones, for novelties and for holding candy.

Construction Paper. Cover papers with soft surface and of many colors; used for cheap mounts and construction of objects by children in kindergarten education.

Container Board. A built-up board, consisting of jute liner for the outer plies and mixed paper or corrugated strawboard for center; used for making shipping containers which must meet a certain bursting strength for railroad classification requirements.

Container Liner. A combination or vat-lined board, strong and with good bending qualities; used as the outer liner of pasted or combined container board in the manufacture of boxes for shipment by freight or express; generally required to meet a certain strength test to comply with railroad classification rulings.

Copying Tissue. A term applied to a group of tissue papers which are slack-sized, soft in texture and of considerable strength, for use in letterpress work or for special manifolding purposes, such as for railroad waybill copying.

Cores, Paper. Tubes or rolls, made of strawboard, chipboard or molded mechanical woodpulp used as a central support for a roll of newsprint, toilet paper, toweling, etc.

Core Stock. Chip or strawboard wound to a desired thickness in the manufacture of paper cores, for use in rolls of paper, etc.

Cork Paper. A heavy rope or manila paper, surfaced with a mixture of glue and powdered cork; used for packing glass, fragile articles, etc.

Corrugated Board. A converted board, consisting of a corrugated sheet of 0.009 point strawboard or lined either one or both sides with plain straw, chip or manila.

Corrugated Container Board. A built-up board, having a corrugated center of 0.009 strawboard and lined with jute or test chipboard; the liners are fastened to the strawboard by means of silicate of soda; used in the manufacture of cartons for shipping purposes.

Corrugating Paper. A term applied to paper which is to be corrugated or molded into a series of rounded ridges; generally applied to strawboard and chipboard for use in the manufacture of corrugated container board.

Cotton Batting. A term applied to a light weight, blue wrapping paper, used as a wrapper for absorbent cotton and cotton batting; generally made of sulphite stock.

Cotton Sampling. White, manila or colored wrappers, made of jute, rag or chemical woodpulp; used for the display of staple cotton. See Sampling paper.

Couche Paper. A coated one-side enameled book paper; used for printing and lithographing high-grade labels.

Cotton Linters. The short fiber adhering to the cotton seed after the staple cotton has been removed by ginning; used for upholstering and nitrating purposes; now used to a considerable extent in bleached pulp form for papermaking.

Counter Board. A pulp board, specially treated; made on wet machine and run through four stacks of calenders; used for making shoe counters.

Counter Roll. Rolls of paper of any grade to indicate that the diameter and width of the roll are such that it may be placed in a rack, mounted on a counter; the diameter of counter rolls is generally 9 inches.

Cover Paper. A general term applied to a class of papers which are used principally for the protection of stitched or stapled literature, photographs, etc. These papers are generally in colors and are relatively strong and heavy and available in many finishes and fancy designs.

Cracker Shell Board. A term generally applied to filled news, when that grade is used to make cartons for the retail sale of cakes and crackers; made of a mixed paper or chip center, with a liner on both sides made of old newspapers; generally treated with sodium silicate on both side before being made into cartons.

Crash Finish. A finish resembling a coarse linen fabric; applied by plating process.

Crayon Paper. A drawing paper; generally a high class, heavy rag paper, tinted or plain colors; glazed on one side only; used for crayon and sepia drawings, water colors, etc.

Cream. A term indicating the very light tints of brown.

Cream Laid. An ordinary writing paper of creamy color; made on a laid wire mold or with a laid dandy roll.

Crepe Paper. A general term descriptive of an effect simulating crepe; effect is produced by crowding the wet sheet on a roll by means of a doctor; sulphite pulp is generally used; sometimes mixed with mechanical pulp; example—paper napkins and towels; also used, especially in colors, for decorative purposes.

Crepe Tissue. See Crepe paper.

Crinkled Paper. Paper that has been crinkled by an embossing process.

Crinkled Tissue. See Crinkled paper.

Cross-section Paper. A writing or bond paper, ruled both ways of sheet with parallel lines at equal distances; better grades are of good map paper of smooth surface, with lines engraved.

Crown. A size of paper 15 by 19 inches.

Crushed Finish. A fancy coarse ripple finish, applied by plater press.

Cup Paper. A printing or writing paper suitable for making paper cups; made of waxed, unwaxed or treated offset book, bond or ledger.

Currency Straps. Thin strips of kraft, manila or dry-finish sulphite wrapping, half an inch to an inch wide; used for bonding currency; in some cases ledger papers in various colors are used to distinguish the various denominations. See Bill straps.

Cushion Board. See Corrugated board.

Cuspidor Paper. Spittoons, molded and compressed from double-faced manila board or hard fiber stock.

Cut Cards. Small pieces of bristols; used in commercial work for personal business cards and for advertising purposes.

Cutlery Paper. A light-weight brown or white anti-tarnish paper; used for wrapping cutlery and silverware.

Cyclostyle Paper. Tissue and waxed paper used for cyclostyle work. See Stencil paper.

Cylinder Bristol. A bristol board, made on a multicylinder machine by combining, by pressure when moist, two or more thicknesses or layers; may be either solid or filled; commonly called mill bristol; a one-process sheet.

Cylinder-dried. A term applied to the process of drying paper, by passing it over internally heated iron rolls; process differs from pole, loft or air-drying in that moist paper is in contact with heated iron rolls or cylinders.

D

Deadening Felt. Felts used in construction for deadening sounds and under hard surface floor coverings as a protection against uneven floors. They may also be used as insulation against heat or cold.

Decalcomania. A paper having a book paper base, sometimes duplex, specially prepared and coated with dextrin and starch on which designs are printed for transfer purposes in ceramic work.

Deckle-edge. The rough, uneven edge of paper as formed in a hard mold or by the deckle strap on a machine.

Deckle-edge Paper. Paper made to simulate hand-made paper, by leaving untrimmed the rough edges produced by the deckle or by a jet of water; by a special method the rough edge may be produced on the machine on all four edges.

Decorated Blottings. A commercial blotting of solid color, on which pulp of a different color has been sprayed during the process of manufacture to decorate and to add to its attractiveness.

Decorated Boards. Any board, having been decorated with a design, either lined or printed on the board itself; example, oakgrained jute board.

Decorated Cover Paper. A kind of cover paper that has been decorated with a design produced by embossing or any other process; may be coated or uncoated; may be decorated during or after manufacture.

Demy. A size of paper, 16 by 21 inches.

Detail Drawing Paper. A manila-colored drawing paper, slightly rough or grained, for detail or working drawings from which drawing is transferred to tracing cloth or paper.

Designers' Pattern Paper. Kraft or manila wrapper, used in pattern work; plans are laid on the floor and structure built to the plans; paper should be strong.

Diapers, Paper. Napkins of soft white tissue paper, made more or less absorbent; used as the name implies.

Die Wiping Paper. A heavy wood manila wrapping paper, highly finished, in rolls; used for the cleaning of dies or plates.

Dirt. The small particles of foreign matter appearing in a sheet of paper; not necessarily earth matter but also such as particles of metal, rubber and vegetable matter which have passed through the screen with the stock.

Dishes, Paper. Receptacles made to resemble different clay product dishes; made of chip board and tag board; may be waterproof.

Dobby Board. See Binders board.

Document Board. A heavy solid board, made of rope, jute, sulphite or mechanical pulp; used for file folders, freight car records, etc. See Document Manila.

Document Envelopes. Envelopes manufactured especially for enclosing documents, pamphlets, etc.; unusually made of heavy manila stock.

Document Files. Document manila, cut to desired sizes for special uses in the filing of documents. See Document manila.

Document Guides. Separator guides in filing cabinets, made of document manila and cut to sizes required.

Document Manila. **(a)** A heavy solid board of rope, jute or sulphite pulp; also a heavy rope wrapping paper; used for various purposes in connection with documents.

(b) A term usually applied to sizes of paper, 24 by 36 inches or larger.

Double Cap. A size of paper, 17 by 28 inches.

Double Coated. A paper or board, having a heavy coating (not necessarily two coatings); especially adapted for use in printing 200-line screen cuts.

Double Coated Printing Paper. Printing paper, coated on one or both sides with a heavy coating of clay and used for printing or lithographing from fine screen cuts.

Double Demy. A size of paper 21 by 32 inches.

Double Demy, Oblong. A size of paper, 16 by 42 inches.

Double Double Cap. A size of paper, 28 by 34 inches.

Double Elephant. A size 27 by 40 inches.

Double Feather Edge Straw Board. A strawboard having its edges thinned to permit its use in small tubes or rolls, so that when pasted, it will have a smooth pasted surface, without a perceptible ridge.

Double Flat Foolscap. A size of paper, 16 by 26 inches.

Double Folio. A size of paper, 22 by 34 inches.

Double Manila Lined Chip Board. A chipboard, having a vat-lining of manila on both sides.

Double Manila Lined News Board. A news-filled body stock, with manila liner on both sides.

Double Medium. A size of paper, 23 by 36 inches.

Double Medium, Oblong. A size of paper, 18 by 46 inches.

Double Royal. A size of paper, 24 by 38 inches.

Double Thick Cover Paper. A term applied to a heavy cover paper, made of two sheets of regular weight cover paper, pasted together.

Drafting Paper. A high grade drawing paper; finish slightly higher than ordinary; surface very hard; extra hard sized; adaptable to pen and ink work as well as pencil; erasure superlative; ink must not spread when applied to erasure; used for original drawings of permanent record.

Drawing Board. A heavy bond or bristol board, made by pasting together three or four sheets of paper with hard smooth surfaces and pure white color, but often India color; used for pen and ink drawings to be photographed, from which printing plates are made.

Drawing Paper. Writing paper of close texture; firm surface; not unpleasant to the touch but with sufficient tooth or grain to take quickly lead pencil marks; finished slightly, without sheen or gloss; good erasing quality; hard sized.

Drinking Cup. A receptacle used for temporarily holding water; made in rigid cup form, or flat, resembling small envelope; made of bleached sulphite, generally paraffined on one side; essentially a ledger or offset book paper.

Dry Felts. See Saturating felts.

Druggists Wrapping. Small rolls of wrapping used by druggists; term is generally applied to a white and colored sulphite bond; sometimes a wood manila; may be specially decorated.

Dry Finish Sulphite Wrapping. Sulphite wrapping paper, made wholly or principally of sulphite pulp, with an unglazed surface.

Drying Paper. Strong tough bag or woodpulp paper of medium thickness; unsized and absorbent; used for letter press, copying books and similar purposes. See Interleaving Paper.

Dryproofing Paper. An absorbent lightweight paper or tissue; used for making first proofs of printing or plates.

Dull Finish. A term used to indicate a smooth surface which lacks shine or gloss; a low finish; applies to coated paper to indicate a natural finish without calendering or gloss.

Duplex Blotting. A commercial blotting, made by pasting together two sheets of plain blotting of different colors; both sides are absorbent, thus differing from enameled blottings.

Duplex Board. Board made on a multicylinder machine, having different colors on the two sides.

Duplex Paper. A term applied to paper having one color on one side and another color on the other side; sometimes applied to machine glazed paper because of the high finish on one side and the rough finish on the other; also applied to a paper made of two layers of different stock or material.

Duplex Wrapping. A wrapping paper having surfaces of different distinctive colors or a glazed surface on one side and a rough finish on the other, such as a machine glazed wrapping.

Duplicating Paper. Light-weight writing papers, such as onion skin and manifold papers, used for duplicating purposes.

Dynamite Paper. See Blasting paper.

E

Easel Board. Any heavy board or blank suitable for easel purposes; patent coated folding box board most commonly used.

Egg Case Filler Board. A board used in making egg carriers; strawboard filler used for domestic use; filled pulp board used for export shipment.

Eggshell Book Paper. A book paper possessing a finish resembling that of an eggshell; somewhat similar to antique finish.

Electric Board. A hard fiber board; used for insulating purposes such as electric switch blocks and boards, etc.

Elephant. A size of paper, 23 by 28 inches.

Emery Paper. See Abrasive paper.

Emperor. A size of paper, 48 by 72 inches.

Enameled. A general term descriptive of a surface produced by a coating with clay or some mineral, like zinc white, and highly polished; such as enameled book, cover, blotting, etc.; used for box covers, for fine line halftone work and for illustrative printing.

Enameled Blotting. A commercial blotting paper, to which a coated or enameled paper has been pasted, thus forming a smooth and solid surface for printing and lithographing; coated side is not absorbent; used largely for advertising purposes.

Enameled Post Card. A medium weight cardboard single or double coated one or both sides; used for souvenir postal cards and similar work where high finish is desired.

FITCHBURG MASS.

Machine and English Finish Book Papers

Offset

Special Papers for Coating

Special Papers for Wall Paper Manufacturers

Capacity 35,000 tons per year

End Papers. The several odd sheets, placed at front and back of the binder in books; generally called fly leaves.

Engine-Sized. A term applied to papers that have been sized in the beater; usually refers to the use of rosin size; the fibers are sized before being formed into the sheet of paper.

English Finish Book Paper. Book paper, finished on the paper machine with a surface between that of the machine-finish and a supercalendered finish; a high machine-finished book.

Engravers' Bristol. A high grade bristol the quality and finish of which is especially suitable for engraving.

Engravers' Proving Paper. A kind of double-coated, one side, highly polished book paper; used principally for taking proofs of engraving.

Envelope Paper. A general term, descriptive of paper suitable for making envelopes; should be strong, opaque for commercial purposes, with good folding endurance and writing surface, and lie flat without curling; manila, rope, kraft, writing, bond and ledger papers used for this purpose.

Esparto Paper. A term given to paper, generally of European manufacture, made in whole or part of esparto pulp; specially adapted for printing and magazine purposes.

Expanding Envelopes. Envelopes made of heavy strong wrapping paper, possessing folding endurance; constructed to permit an expansion in the enclosure space, similar to a bellows; used for filing legal briefs and documents.

Express Wrapping. A general term applied to a high water-finish sheet of heavy wrapping paper; used for wrapping large and bulky packages; grade depends upon the strength required; it may be a bogus, or wood manila, a sulphite or a sulphate.

Extra Fine Writing. An extra grade of fine writing, firmer and stronger, even at a slight sacrifice of beauty.

F

Facing Paper. Light-weight paper, such as fancy covers, book and manila; used to paste on a board filler to give smooth and attractive surface.

Feather Edge Deckle. Papers made with a thickness tapering from that of the body sheet to edge; used on fireworks papers so that when rolled, the outer edge will paste down smoothly.

Featherweight. A general term indicating light weight, used in connection with such papers, as light-weight bulky book paper, thin opaque writing paper made largely of soda pulp and light-weight tissue.

Feel. A term referring to that characteristic of a sheet of paper which is obtained by contact with the fingers; it is an empirical method of judging the finish and general quality of paper.

Felt Browns. A term sometimes applied to carpet felts.

Felts. A group of bulky, rough and cheap building papers, ordinarily distinguished from sheathing papers in that they are more loosely formed and thicker.

Felt Side. The smooth side of a sheet of paper, as distinguished from the wire side; refers to the side of the sheet which is not in contact with the wire during manufacture.

Fender Board. A board made of hard fiber or rag stock; used as a wood substitute; also used by woolen mills in their presses when finishing cloth by the press process.

Festoon Dried. Air-dried, by means of a method wherein the paper is hung in a single continuous web, in short festoons or loops on traveling poles or slats, moving through a loft or drying room; controlled for temperature and humidity; subsequently seasoned and conditioned before finishing. This term is applied to the drying of paper after coating, to wall paper after printing and to roofing felt or paper after saturation or coating.

Fiber Board. A board, made wholly or largely of primary fiber stock, giving a product that is tough, pliable, waterproof and capable of being molded; used chiefly for shoe counters and inner soles.

Fiberoid. Heavy rope wrapping used for extension envelopes.

Fiber Panels. Panels made of cloth board or hard fiber.

Fiber Paper. A loosely used term, referring to paper made of long fibered sulphite or sulphate pulp; also refers to hard or vulcanized fiber.

Fiber Rugs. Rugs made of grasses, straws or twisted paper.

Fiber Shipping Containers. Cartons made of jute board and other similar stock; either solid or corrugated.

File Backs. A piece of tag board or document manila; used as a protection or backing for a file of correspondence or forms attached to it.

Filled Jute Board. A combination board, vat-lined with jute, sulphite or sulphate pulp, having for a filler a grade of stock, inferior to its surface. See Combination board.

Filled News Board. A board having a news stock liner on both surfaces, with a filler of some other stock. See Cracker shell board.

Filled Pulp Board. A board lined on both surfaces with wood pulp facing and with a chip or news stock center.

Filler Board. The center of any mixed paper or chipboard, where the liner is of different stock than the body.

Filter Paper. A porous, absorbent paper, used for filtering liquids, for drying crystals, etc. Ordinarily made of rags or chemical woodpulp, but better grades made of selected rags; quantitative filter paper is acid-washed (hydrochloric and hydrofluoric acids).

Fine Papers. A class of high-grade papers, such as bonds, linens, ledgers, writings, etc.; distinct from coarse papers.

Fines. See Flats.

Fine Writings. See Flats.

Finger Bowl Liner. An article made of sulphite pulp, specially sized to conform to shape of a finger bowl and used as a liner in the bowl.

Finish. A term used in referring to the surface characteristics of a sheet of paper or of a board.

Fireproof Paper. A general term descriptive of paper which has been treated to render it fire resisting.

Fireworks Paper. A heavy bogus wrapping or light-weight chipboard; used in the construction of fireworks.

Fish Paper. A term applied to a chemically treated board; used as a non-conductor of electricity as insulation in building dynamos and motors.

Flat Cap. A size of paper 14 by 17 inches. Also called Cap.

Flats. Writing paper in which beauty of formation is the denominating characteristic; short-fibered, close formation, fine grain and texture; generally high-finish, firm, but not excelling in bursting or tearing strength; usually wove, but may be laid; white or colored.

Flat Foolscap. A size of paper 13 by 16 inches.

Flat Wallets. Specially constructed envelopes with pockets; made of heavy rope stock.

Flat Wrappers. A general term applied to sheet paper, to be used for wrapping purposes, which is put up in bundles of flat sheets instead of quire fold or interfold.

Flexible Cover. A cover paper that is designed to be flexible; used for book covers, pocketbooks, etc.

Flint Glazed. Term indicating a method of giving a high finish to paper; originally derived from the practice of glazing one side coated papers with smooth flints.

Flour Sacks. A bag suitable for the packing of flour; made of heavy strong rope, jute, or sulphite.

Flowers, Paper. Imitation flowers, made of white and colored tissue and light-weight writings of good quality; used for decorative purposes.

Fly Paper. A strong rope, manila, or jute-like wrapping paper, coated on one side with a sticky substance; or an absorbent paper impregnated with arsenic, quassia bark or similar poisonous material; used for catching flies.

Foil. Paper, coated with aluminum, tin, copper or zinc; used for packing, decorative purposes or often for wrapping candy.

Folded Writings. Writing papers in various note and letter sizes as well as foolscap and legal sizes that have been folded once.

Folder. (a) A circular or other piece of direct advertising, folded; frequently folded in an unusual manner in which the printed matter is confined to the space within, never across the folds.

(b) A manila sheet, folded once and used for filing purposes.

Folder Stock. A manila bristol, made of mechanical pulp, sulphite or rope stock; used for file folders.

Folding Boxboard. (a) A coated boxboard, with a base of mechanical pulp or newsboard; flexible and suitable for fine grade of folding boxes; printed or lithographed.

(b) A term used to indicate any grade of board that can be made into folding boxes without breaking or cracking.

Folding Bristol. Board of the bristol type, but with longer and more flexible fibers to make folding possible.

Folding Satin. A cheap grade of stock resembling translucents, but with a manila or dark base; particularly adapted for folding purposes.

Folding Translucents. A bristol, possessing folding qualities; clay coated and with high finish.

Folio. (a) A size of paper 17 by 22 inches. Also called "folio post."

(b) A book size indicating a sheet folded once; the largest size of book.

Foolscap. A size of paper 13 by 16 inches. Also called Flat foolscap.

Formation. As applied to a sheet of paper, the fixed disposition of its fibers; the term is generally used to include all effects produced in the paper before passing over the drying rolls, exclusive of the marks produced by the dandy roll; the formation is examined by holding the sheet to the light.

French Folio. A kind of light-weight writing paper; used for making proofs, for second sheets and for various purposes where a light-weight paper in several colors is required; a smooth-finished manifold.

MILLS AT

LAWRENCE, MASSACHUSETTS

Fourdrinier Bristol. A bristol made on a fourdrinier machine; a solid sheet; resembles heavy ledger and is used chiefly for index purposes; a one-process sheet.

Friction Board. A heavy, compressed solid board, made of chemical woodpulp, mixed papers and tar, or of mixed papers used for making friction or paper pulleys by cutting out circles and bolting a number of them together as layers to form a pulley.

Friction Glazed. A term indicating a high finish obtained by calendering paper between rolls running at different speeds.

Frisket Paper. A manila wrapping used for friskets on printing presses.

Fruit Tissue. A wrapping tissue made of sulphite or sulphate pulp and used for protecting and preserving fruit for shipment; must be strong enough to twist or wrap about large fruit.

Fumigating Paper. Paper soaked in potassium nitrate, dried and then steeped in an alcoholic solution of fragrant balsams; used as its name implies.

Furniture Paper. Wrapping paper slit to narrow widths to facilitate winding around the frames of chairs, tables and other furniture to prevent damage in transit; applicable to any grade used for this purpose.

Fuzz. Loose particles of paper or powdery substance on the surface of paper.

G

Game Counters. Pieces of cardboard of various grades such as tough check and railroad board cut to special sizes and in a variety of colors for game record purposes.

Garnet Paper. See Abrasive paper.

Gasket Stock. See Hard fiber.

Gelatin Board. A board which possesses a smooth surface, hard enough to stand the use of tacky inks without picking; it must change in dimension but slightly when wet.

Geography Paper. This term ordinarily refers to a supercalendered book paper used for printing maps in school books. It may also refer to map paper, which see.

Glassine. A kind of sanitary wrapping paper made of ordinary sulphite or Mitscherlich pulps by long continued beating followed by supercalendering. It is a highly transparent thin paper and is used for small envelopes, bags, covers and for windows in envelopes. It may be decorated or embossed.

Glassoid. A trade name for a material similar to glassine, but more highly finished and resembling isinglass.

Glass Paper. See Abrasive paper.

Glazed Board. A board, glazed or polished to a high surface by any process.

Glazed Book Paper. A book paper specially glazed for box covers and labels.

Glazed Finish. A term used in describing the finish of a highly polished paper or board; produced by calendering, either web, plate or friction; and also on a Yankee drier of the paper machine; used in connection with coated book, board, cover and certain wrapping papers.

Gold Paper. Paper made to resemble gold in color; coated with gilt; used for seals and similar purposes.

Grain Direction. The direction in which the fibers flow on a papermaking machine.

Grained Jute Board. A solid or filled jute board, printed on one or both sides to resemble wood or marble; used for decorative purposes, backs of check books, suit boxes, etc.

Granite Paper. A general term indicating a paper that is mottled to imitate granite by adding fairly long fibers of a different color; generally refers to cover, blotting, wall paper and some fancy writings. See Ingrain. See Mottled.

Grass Bleached Tissue. Thin tissue paper of special white color; name is intended to indicate open air bleaching; used for wrapping stationery goods.

Greaseproof Paper. A wrapping paper made of sulphite pulp, usually Mitscherlich or other strong sulphite, beaten till thoroughly hydrated and also thoroughly jordanned. This paper resembles the vegetable parchment made by chemical processes, but is not stronger when wet than when dry, as is the case with vegetable parchment. It is used for wrapping greasy food products and is also the base from which glassine is made. Also called imitation parchment, pergamyn and parchmoid.

Grocery Bag Paper. A term applied to paper used in the manufacture of grocery bags; paper should be strong enough to hold contents of bag; generally light weights of manila, kraft or sulphite wrapping are used.

Guide Card Stock. A board used as a divider or guide in keeping records; white, manila and assorted colors; index bristol, document manila, etc., commonly used for this purpose; in large sizes, press board is used.

Gummed Paper. Various kinds of paper, such as kraft, writing, book, label paper, etc., gummed on one side with an adhesive; used for labels, alphabets, numbers, etc.

Gummed Tape. See Sealing tape. See Paper parcel tape.

Gum Wadding. A thick felt or chipboard, used in loading shotgun shells.

Gusset Felt. A stiff cheap board, made of old rags or mixed papers; used for stiffening the sides of traveling bags.

Gypsum Plaster Board. An incombustible board composed of gypsum plaster, reinforced on the surfaces with a covering of fibrous material (bogus wrapping or felt). It is designed to be used as a backing for the application of gypsum plaster.

Gypsum Wallboard. An incombustible board, composed of gypsum plaster, reinforced on the surfaces with a covering of fibrous material (chipboard, sized pulpboard, etc). It is designed to receive decoration, without the use of plaster.

H

Halftone News. A newsprint possessing a high finish, produced by the addition of a filler.

Halftone Paper. A term used to denote a printing paper, suitable for printing from halftone cuts; generally high machine finish, supercalendered or coated.

Ham Paper or Ham Wrap. Paper used for wrapping hams; bogus wrapping, straw paper, dry finish butchers, oiled manila and vegetable parchment are used for the purpose.

Handmade. Paper made by hand mold in sheets, having rough or deckle edge on four sides; the mold, of size required, is dipped in the vat containing stock and is lifted out with a certain, definite motion.

Hangings. Heavy newsprint which, when printed, embossed or colored on a coating machine, is used for wall paper.

Hard Fiber. A general term used to include hard-rolled, stiff boards of dense nature; used for trunks, gaskets, shoe counters, insulating purposes, etc. Also called vulcanized fiber.

Hard Sized. A term applied to the resisting qualities of paper when water or ink is applied; sizing quality is increased by the addition of rosin to the beater or by tub-sizing with glue or starch; a sheet is said to be hard sized when it resists to a considerable extent the penetration of ink or water.

Hardware Paper. A paper suitable for wrapping hardware; generally a strong, water-finished paper, black in color.

Herbarium Paper. A strong ledger paper; used in the handling of plants and seeds.

Heeling Board. A hard fiber or leather board of considerable stiffness; used in the manufacture of heels in shoes, or as a substitute for leather.

Hinged Ledgers. Ledgers designed for loose-leaf work; the pages frequently have a paralleling binding edge, a narrow strip (frequently attached to the page by a strip of cloth) so formed or manipulated as to give increased flexibility, assuring flatter opening of the book.

Heralds. See Flyers.

Hosiery Paper. Wrapping or tissue paper paper used in connection with hosiery; may be used to designate wrapping paper to wrap a box of hosiery; to designate the lines of individual boxes, or as a flyleaf; it is usually a white or decorated paper when used on the inside and a kraft, manila or sulphite paper when used as a wrapper.

Hot Pressed Paper. Highly surfaced paper, finished by the plate glazing process; usually refers to drawing paper.

Hull Fiber. The short fibers adhering to the cottonseed hull after de-linting; used to some extent for the production of a bleached pulp for papermaking.

I

Ice Blanket, Paper. Sheets of vegetable parchment, cut to sizes to cover cakes of ice, as a protection against heat.

Ice-Cream Boxes. Receptacles made of solid manila and double manila lined news; used for carrying ice-cream.

Ice-Cream Dishes. Plates made of solid woodpulp board and single bleached sulphite liner with solid manila back; used for serving ice cream.

Ice-Cream Spoons. Molded spoons, made of hard fiber or solid pulpboard.

Imitation Art Paper. An English term referring to a paper, heavily loaded with clay and run through damping calenders; used as a substitute for coated papers when the requirements are not so severe.

Imitation Jute Board. A combination board, having for its surface a liner of pulp, consisting of sulphite or sulphate pulp.

Imitation Kraft. A paper colored to resemble the peculiar brown, which is the natural color of a genuine kraft; it is most commonly made of unbleached sulphite, but may be re-manufactured or bogus kraft.

Imitation Parchment. **(a)** Paper rendered grease and waterproof by prolonged heating; sulphite used for this purpose. See Greaseproof. **(b)** Waterleaf rag paper, treated in a sulphuric acid bath to produce a tough and somewhat transparent grease and waterproof paper. See Vegetable parchment. Both kinds are used for wrapping and for sanitary packages of various kinds.

Imperial. A size of paper 23 by 31 inches.

Impression Paper. See Duplicating paper. See Mimeograph paper.

WISCONSIN
WIRE WORKS
APPLETON
WISCONSIN

Indented. A term used to indicate that the sheet of paper has been indented and contains small indentation, without breaking the fibers of the sheet, producing a soft, bulky sheet of paper; especially suitable for packing or wrapping purposes when it is desired to prevent jar.

Indented Board. Chipboard, made of mixed papers, indented by rollers or raised bumps; used for packing bottles and glass containers; for lining refrigerators and protection to furniture, for floor covering under carpets and as core paper in cast iron pipe foundries.

Index Bristols. Cardboards made on the fourdrinier machine of homogeneous stock (such as rags and sulphite), finished and sized for pen and ink work; or made by pasting together two or more plies of the same kind of paper. Used principally for index records, business and commercial cards; it resembles a heavy ledger.

Index Card. A small card, cut from index bristol or heavy ledger; generally in sizes 3 by 5, 4 by 6, or 5 by 8 inches.

India Proof Paper. Thin tissue paper, made from the inner fibers of the bamboo stem; extremely soft and absorbent; suitable for taking full bodied impressions in plate printing.

India Tint. A term applied to a well recognized shade of light brown; applies to writing, blotting, book and cover papers.

India Transfer Paper. See India proof paper.

Indicator Board. A clean, white soda pulpboard with high finish; used for faces of clocks and watches, etc.

Indicator Paper. A book or writing paper, used in connection with an apparatus for determining power of a steam engine, and for other self-recording devices.

Industrial Writings. A group of fine writing papers made for specific uses, as distinguished from ordinary correspondence, commercial and duplicating writing papers.

Ingrain. A term applied to certain mottled effects found in wall paper.

Innersole Board. A hard fiber board, made of rags and leather clippings; used as innersoles of shoes and slippers as a substitute for leather.

Insulating Board. A tough hard-rolled board, similar to press board or vulcanized fiber board; used for insulating purposes around electric motors, etc.

Insulating Paper. Strong, well-sized, acid-free papers, specially washed free from soluble salts in order to render the paper less hygroscopic and thus maintain its electric insulating qualities.

Insulating Tissue. A strong tissue paper, made from rags, sulphate pulp or manila and jute fiber; should be free from chemical residues as it is used chiefly for wrapping an insulation about electric wires.

Intaglio Paper. A high grade bond paper, suitable for intaglio printing.

Interleaving Paper. A thin blotting paper to be inserted between printed sheets to prevent offsetting or blotting; also between the leaves of books for the purpose of absorbing ink from freshly written manuscripts.

Iridescent Paper. Paper with an iridescent surface appearance.

Ivory Finish. Special finish on high grade cards; obtained by calendering through rolls upon which beeswax has been rubbed; also refers to a color, cream white.

Ivory Board. A highly finished non-bending clay-coated two-sides board; used for high class art printing, for hotel menus, etc., when halftones are necessary; also known as menu board or translucent.

J

Jacquards. Hard board or press board, cut and perforated to suit the jacquard looms in spinning factories; used to transfer designs to fabric being woven, the yarn going through the perforations of the board.

Japanese Copying Paper. Specially thin and strong tissue papers, made in Japan from long fibers; used for copying books.

Japanese Paper. A general term descriptive of paper with long fiber as made in Japan or in imitation of it; used for fine engravings and for proofs of engravings and etchings.

Japanese Vellum. Thick paper with long fiber, as made in Japan, or in imitation of it; formation very cloudy; very tough and durable; almost as difficult to tear as vellum; color usually cream or natural; finished with good surface and suitable for certificates, or when tough durable paper is necessary.

Jelly Protectors. Heavy sulphite bond or vegetable parchment, cut to desired sizes and used for covering jelly or other preserves when in jars.

Jumbo Rolls. A term applied to rolls of paper of any grade where the diameter exceeds 9 to 12 inches.

Jute Bag Paper. Wrapping paper made wholly or principally of pulp from jute butts, burlap or hemp and used for the manufacture of paper bags.

Jute Board. A strong solid board, made of kraft pulp on cylinder machine; used for manufacture of folding boxes.

Jute Bristol. A sheet of unusual strength, having high tearing strength and used for various purposes where durability is essential.

Jute Envelope Paper. Paper made of jute butts, burlap or hemp, with good writing surface; used for the manufacture of envelopes.

Jute Imitations. A cheap board, made of mixed papers, colored to resemble jute board and marble or oak grained.

Jute Lined Chipboard. A combination chipboard, vat-lined with sulphite or sulphate pulp.

Jute Lined Strawboard. A combination strawboard, vat-lined with sulphite or sulphate pulp.

Jute Liners. See Container liner.

Jute Manila Wrappings. Wrapping paper of manila color, made of jute and manila clippings or burlap; used for wrapping and in the manufacture of clasp envelopes.

Jute Paper. A strong wrapping paper, made of old rope, burlap, or jute waste; used for heavy wrapping and for lime and cement bags.

K

Keyboard Paper. An all-sulphite sheet used on monotype machines.

Kid Finish. A term applied to a finish, given to high-grade paper or board resembling in appearance and feel that of undressed kid; obtained by the plating process and on calenders; also used to designate a special low machine finish.

Kraft. A term applied to a brown wrapping paper, made wholly of sulphate pulp or mixed with sulphite pulp.

Kraft Bag Paper. Wrapping paper made of sulphate or sulphite pulp and used in the manufacture of paper bags.

Kraft Board. A board made principally of sulphate pulp; possesses unusual strength; sometimes referred to as jute board.

Kraft Envelope Paper. An envelope paper, made of sulphate or sulphite pulp.

Kraft Paper. Paper made wholly or principally of sulphite or kraft pulps.

Kraft Pulp. Pulp of wood, by a chemical caustic cooking process; used in connection with a large number of kinds of wood; process differs from soda process in the addition of sodium sulphide; generally a strong brown pulp.

Kraft Waterleaf. A light-weight absorbent paper made of sulphate pulp; unsized; used principally for toweling.

Kraft Waterproof. A kraft wrapping paper that has been treated with paraffin, asphaltum or other material to make surface impervious to water.

L

Label Paper. Machine finished, supercalendered or coated one-side book paper; especially sized for label printing and lithographing; used for all kinds of labels.

Lace Paper Stock. White sulphite bond or machine finished book paper, converted into papers resembling lace by means of punching or die cutting; used for decorative purposes, such as shelf paper, etc.

Laid. A term applied to papers made with the dandy roll, woven in such a manner as to leave distinct raised lines; those made in machine direction (around the roll) being about one inch apart, while in the cross direction (at right angles) the lines are close together; a special watermark produced by a laid dandy roll.

Laid Antique. This refers to an antique finish on a laid sheet. The formation of a paper may be either laid or wove, the laid depending on the sort of dandy roll used.

Laid Writings. Fine flat writing papers of laid formation; usually in colors.

Laminated Strawboard. Straw paper built up to desired thickness by combining two or more sheets; same as pasted or airdried strawboard.

Lampshade Paper. Heavy vegetable parchment or treated ledger paper, decorated and used as lampshades as a substitute for parchment.

Laundry Board. A term applied to any kind of board, stiff enough to be used as bosom stiffeners in laundered shirts; also known as shirt boards; generally cut in sizes 8 by 16 and 9 by 18 inches.

Lawn. A finish imitating linen finish, applied by pressure to paper.

Layer Board. A medium weight board, made of solid pulpboard or blanks; used for layers or dividers in cracker and cake boxes.

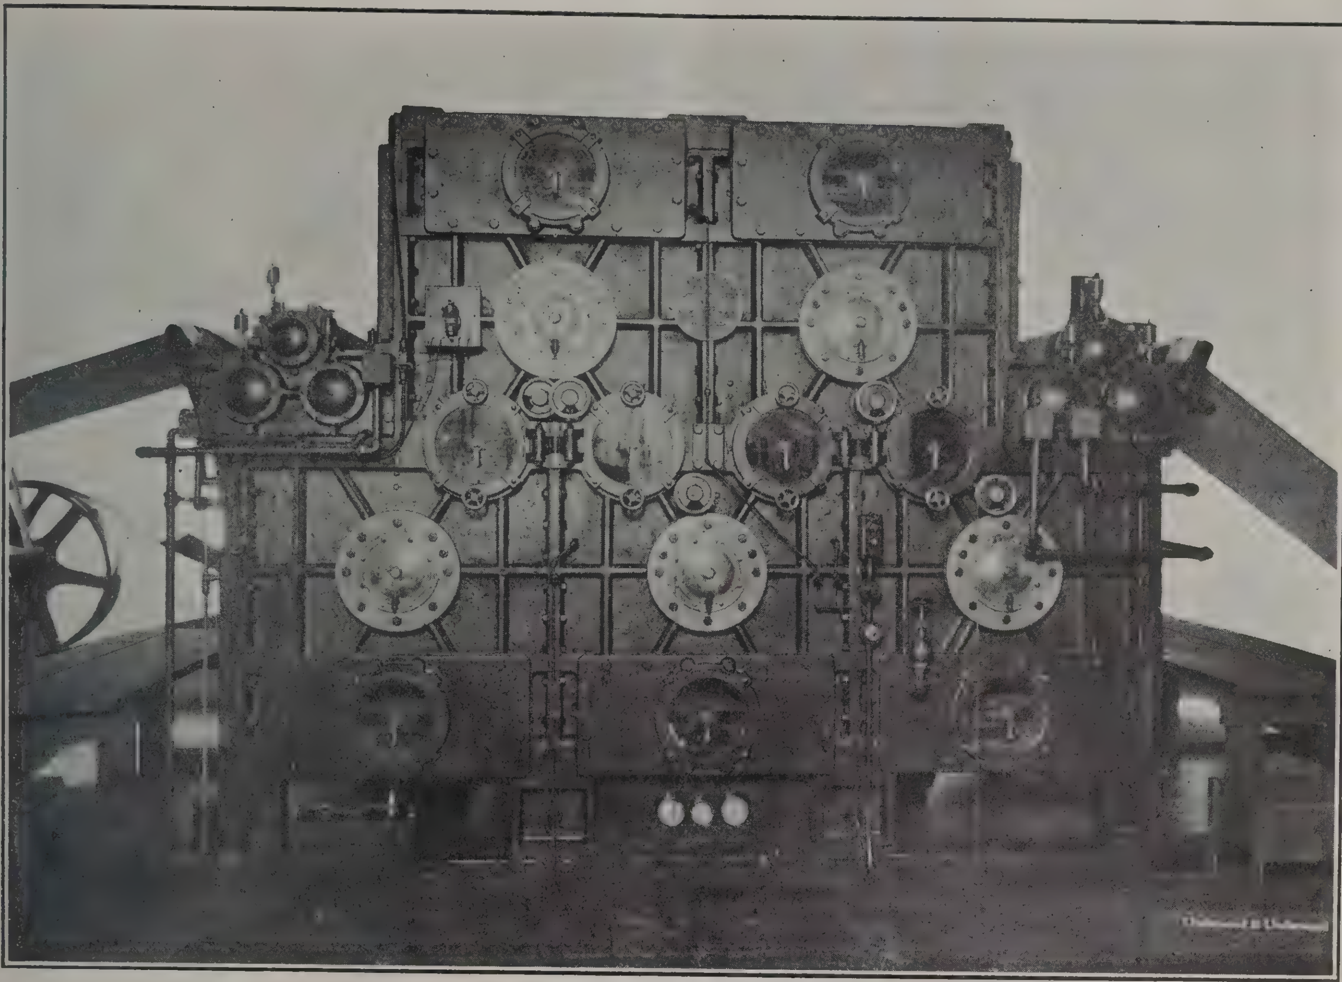
Lead Pencil Paper. A strong sulphite manila wrapping slit to very narrow widths and used in the construction of paper pencils.

Leather Board. A variety of solid board, made from pulped scrap leather with or without jute, manila or paper clippings, on a wet machine; it is often called imitation leather.

Leatherette Cover Paper. A cover paper, embossed to have the appearance of leather; used for box covering and for covers of cheap notebooks.

Ledgers. Writing paper of medium to heavy substance, made on fourdrinier machine; hard-sized, either tub or engine or both; good erasing qualities; may be loft, air or machine dried. It carries medium finish; fibers are long, formation is open (slightly cloudy), not pebbled as in bond paper. Originally designed for use where durability is the primary essential, such as account books, court records, deeds and other legal forms and documents, now made in many grades, fairly true to type, to meet more general needs, particularly in commercial work, such as business and shop forms, stock acrount and blank books.

Minton Vacuum Paper Machine Dryer



A New and Improved Method of Drying Paper

Under 28″ Vacuum **At a temperature of 100° F.**

Greatly reduced number of dryers

Some of the advantages over present system—

- **Steam consumption materially reduced**
- **Low drying temperature (100° F.)**
- **Strength and quality of paper improved**
- **Machine room free of vapor**
- **Reduced broke**
- **Drying not affected by weather**
- **Better control and more uniformity of product**
- **Drying unit occupies less floor space**
- **First cost no higher**

This machine will be demonstrated on the 10th and 11th of April (Convention Week), or at any other time by appointment, at the plant of the Norwalk Iron Works, South Norwalk, Conn. South Norwalk is on the N. Y., N. H. & H. R. R., one hour ride from New York City. ***INQUIRIES SOLICITED***

OGDEN MINTON

Smith Building Greenwich, Conn.

PHONE: Greenwich 329

Legal Cap. A size of paper 8½ by 14 inches. Also called Legal blank.

Lens Paper. A tissue made of long fibers and used for wrapping and polishing lenses; tissue of Japanese fiber generally used.

Lined Boards. **(a)** Mill-lined refers to any board that is lined with newsprint, book paper, cover paper, etc., after the board is made on the board machine and while it is still in the roll, before being cut into sheets. **(b)** Vat-lined is a term applied to any board made on a multicylinder machine, where the top or bottom liner or both are of different quality stock from the filler or center of the board; this term refers to a one-process sheet, the liner or liners being applied as the board is being made on the wet end of the machine. **(c)** Sheet-lined refers to board that is lined, sheet by sheet, on a sheet lining machine; any board whatever can be sheet lined with any quality of lining paper selected.

Lined Paper Plates. Plates made of vat-lined chipboard.

Linen Brief. A paper of foolscap size, ruled with 36 lines across the width of the paper and with a vertical marginal line.

Linen Faced. A linen finished paper used as a facing sheet to a great extent in making boxes.

Linen Finish. A term indicating a finish resembling linen; produced by embossing, by plating with linen glued to zinc plates, or by interleaving linen and paper with zinc plates top and bottom of pile about 4 inches high; an embossed or plated finish.

Linen Ledger. A ledger paper of high grade, originally containing a large proportion of linen rags; now frequently contains a small quantity of linen rags, and in many cases made entirely of the best substitutes, first-class new cotton cuttings; great endurance, especially when folded; excellent erasure quality; extra hard-sized, both in engine and tub.

Linens. Originally a writing paper of light to medium substance; of long, flexible fibers; well distributed and interlaced (felted); produced on a hand mold of laid pattern, and imitating in marked degree the first paper made by the Chinese, which was later known in commerce as India paper; very hard-sized, for pen and ink use, as distinct from the use of the oriental brush; color usually natural or cream; probably derived its name "Linen" from the fact that linen rags afforded the most adaptable fibers for producing this imitation of India paper; highly preferred, before the advent of the typewriter, for commercial correspondence; adopted very largely for typewriting work during the first years, following the introduction of the typewriting machine; woven largely superseded laid, owing to better adaptability for typewriting; as papermaking developed, new cotton rags were mixed with the linen of substituted, therefore, today, usually made on a fourdrinier machine, in many grades, from a great variety of papermaking fibers.

Liners. The outside layers, i. e., the vat-lined or sheet-lined surface, of a built up or combination board.

Lining Paper. Paper used for lining purposes; it may apply to news or book paper, sized specially for pasting or for lining strawboard for manufacture into boxes; may also be a wrapping, used as a lining for shipping cases or freight cars.

Litho Blank. A cardboard, having a highly polished clay coated surface; used for color printing, posters, etc.; coating must take lithographing.

Linters. See Cotton linters.

Lithograph Book Paper. A soft-sized, carefully made book paper, with good finish for lithographic printing; made of rags, sulphite, soda, or pulp from old magazines; used for illustrations and color printing, often coated or supercalendered.

Litmus Paper. A chemical test paper, made by soaking filter paper in tincture of litmus; acids turn the paper red, alkalis turn it blue; three kinds made, red, blue and violet; the last being a neutral paper.

Loft-Dried Paper. Paper which, having been immersed in a tub of a solution or emulsion made of animal hide cuttings, glue, starch, tapioca flour, Irish moss, or other vegetable substances, is while still wet, cut into sheets, which are hung or laid over poles in a loft, controlled for temperature and ventilation, thus drying without tension; subsequently seasoned and conditioned before finishing.

Look-Through. A term applied to the appearance of a sheet of paper when held to the light; a poor "look-through" means a blotchy appearance or wild formation.

Luminous Paper. Paper prepared by mixing a phosphorescent compound with the halfstuff or by coating the finished paper with such a mixture.

M

Macaroni Paper. A wrapping paper colored blue, used in connection with packages of macaroni; it contains sulphite or sulphate in whole or in part depending upon the strength required; it may or may not be machine finished.

Machine Dried. A term applied to the process of drying paper, by passing it over internally heated iron rolls or cylinders of a paper machine; process differs from pole, loft or air drying in that the moist paper is in contact with the rolls or cylinders and is under considerable tension.

Machine Finish. A term applied to a finish of paper, obtained by passing the paper through a paper machine calender stock; a finish higher than antique; also a term sometimes applied to paper with finish as it appears leaving the last dryer.

Machine Finish Book Paper. Any uncoated book paper, having the surface finish obtained from the calender stock of a paper machine.

Machine Finished Cover Paper. A kind of uncoated cover paper with a surface or finish, obtained by passing through the machine calender stack without other calendering or polishing.

Machine Glazed. Wrapping or tissue papers made on a Yankee machine and dried upon one large steam heated revolving cylinder, which produces a highly glazed surface on the side next to the heated roller, leaving the other side in the same finished condition as it came from the wet end.

Mailing Tubes. Strawboard, or lightweight chipboard, wound to several thicknesses, sometimes spirally, to desired size and cut to various lengths; used for mailing purposes.

Manifold Books. Books made of lightweight manifold or copying paper for duplicating purposes.

Manifold Paper. Light-weight writing paper, which, when used alternately with carbon papers, produces multiple copies of written or typewritten work; unglazed or glazed finish.

Manifold Tissue. A tissue paper used for duplicating work when a large number of copies are to be made on the typewriter at one time. See Manifold paper.

Manila. A general term originally used to indicate content of manila rope in the finish, in whole or in part; now descriptive of a color of paper or board; and does not refer to the stock used; color similar to that of mechanical pulp.

Manila Bag Paper. A bag paper, either of rope, jute or sulphite pulp and of a manila color.

Manila Board. A combination board, made of mechanical pulp and sulphite, old rope or bagging, which is either patent or clay coated.

Manila Drawing Paper. Manila paper, of rough finish; possessing a "tooth" suitable for use with pencil for practice drawing purposes.

Manila Envelope Paper. A manila paper of the wrapping paper type, possessing folding qualities and suitably finished for pen and ink.

Manila Lined Chipboard. Combination chipboard, with a manila liner on one or both sides; the manila liner may be made of mechanical pulp, sulphite pulp, old rope or bagging.

Manila Lined Newsboard. A combination newsboard vat-lined, one or both sides, with manila stock, made of sulphite or a mixture of sulphite and mechanical pulp.

Manila Lined Strawboard. A combination strawboard, vat-lined one or both sides with manila pulp, made of sulphite or a mixture of sulphite and mechanical pulp.

Manila Tissue. A tissue made of rags, sulphite or mechanical pulp and given a manila color.

Manila Wrapping. A term applied to a group of manila-colored wrapping papers, made of sulphite, or a mixture of sulphite and mechanical pulp; used for various wrapping and printing purposes and also for envelopes, filing folders, etc.

Manila Writing Paper. A paper originally made from hemp, the fiber of jute or manila; color bright buff or yellow, from full bleached stock (brown from unbleached); sizing hard; generally high machine finish varying to low or antique.

Manuscript Cover. A light weight cover paper; used for protecting legal papers and manuscripts; made of varying quantities of rope, soda and sulphite pulp.

Manuscript, Music. High grade paper of the ledger or drafting type, smooth finish, extra hard sized; erasure superlative; ink must not spread when applied to erasure; used for writing musical scores with pen and ink.

Map Paper. A firm, closely-knit, hard-sized writing paper, light to medium substance capable of good register; finish generally high.

Marble Board. Solid jute board; made of sulphite or sulphate pulp; grained to resemble marble; used for check book covers, etc.

Marble Paper. A glazed paper, having a design printed upon it or by special process laying on a bath, giving the appearance of marble.

Matrix Paper. A heavy, unsized, unfinished paper, which when moistened and prepared, becomes elastic and, when forced over the printers' type form, takes its impression; this form is baked and used for making a metal plate for roll printing; used principally for large runs such as newspapers and various types of publications; may be a solid sheet or may be built up of matrix paper and stereotyping tissue with an adhesive mixture of formaldehyde, china clay, straw, flour, French chalk and gum arabic or similar mixture.

Samuel Snell Company

MANUFACTURERS . . . HOLYOKE, MASS.

Mat Board. A combination board, lined with a plain or decorted cover; possesses rigidity; used for mounting specimens or articles.

Match Board. A two-ply board, made of mechanical pulp and sulphite, impregnated with paraffin and chemicals and used in the manufacture of paper matches.

Mat Facing Paper. Paper used for covering mat boards, which see.

Mechanical Pulp. Woodpulp produced by the rubbing action of revolving grindstones against short logs of wood; wood pressed sidewise against the stone by hydraulic pressure with the addition of more or less water.

Medio Board. A particular kind of bristol board used in a gelatin process of printing particularly applicable to an imitation of the regular photographic print.

Medium. A size of paper, 18 by 23 inches.

Medium Finish. A finish that is neither high nor low—between supercalendered and antique; such as machine and English finish.

Metallic Paper. Especially coated paper on which marks may be made with a metal point or stylus; used for note books and indicator diagrams; mixture of whiting, lime and zinc is used as coating, and then glazed.

M. F. See Machine finish.

M. G. See Machine glazed.

Middles. A rough coarse board, made from mixed papers and mechanical pulp; used as a filler for cardboard.

Mill Blanks. A one-process board, not coated, made on a multicylinder machine; two outer plies of white stock; inner plies of mechanical pulp, over-issue news or cheap waste material.

Mill Board. A board made of woodpulp or mixed papers; used for binding.

Mill Bristols. A term applied to a group of bristols, made on a cylinder machine, by combining by pressure when moist, two or more layers; or made by pasting together two or more plies of the same or different kinds of paper.

Mill Glazed. Paper finished on the calender stack rather than on the plater.

Mill Lined Board. Any board that is lined with newsprint, book or cover paper, before being cut into sheets.

Mill Wrapping. A general term to designate grades of paper used by mills for wrapping purposes; grade depends on the quality of the contents and upon the custom of the mills. **(a)** Heavy weight screenings for wrapping paper mill runs or large rolls and paper put up in bundles. **(b)** Heavy sulphite wrappers, highly-finished, sometimes duplex in color; used for wrapping reams of fine writings, etc.

Mimeograph Paper. Slack-sized, semi-absorbent printing paper, with rough finish and generally laid watermarked; used for duplicating by means of a mimeograph machine; made of soda or sulphite; sometimes contains rags and clippings.

Mitscherlich Pulp. Chemical woodpulp cooked by the original sulphite process, where the heat is obtained from steam coils in the bottom rather than by the direct introduction of steam to the chips; a slow cooked pulp.

Mixed Papers. A cheap grade of waste paper or paper stock; collected from department stores, offices, schools, etc.; not sorted.

Monotype Paper. A white book paper, in small rolls; perforated with small circular holes; used on a monotype keyboard machine. Also called Keyboard paper.

Mothbag Paper. A strong manila wrapping paper, often in red color; treated to prevent the presence of moths.

Mottled. A variegated effect on the surface of paper, produced by the introduction of a small amount of strongly colored fiber to stock of another color; used for fancy and decorative purposes.

Moldmade Paper. Imitation handmade paper; sometimes made on a cylinder mould by dividing the surface with rubber bands to simulate the deckle edge of handmade paper.

Mounting Board. Cardboard made by pasting card middles together for the body of the board, which is then surface-lined with a good grade of box cover liner; has either a smooth surface both sides or a smooth surface one side and an art mat surface on the other.

M. Paper. A term applied to paper that is not up to the first sorting, but in which the imperfections are trivial, perceptible only to the expert.

Multigraph Paper. Paper of various grades, colors and finishes suitable for use on a multigraph press.

Munition Board. See Ammunition paper.

Music Cover. A heavy-weight book paper; used for the protection of sheet music; often a coated book or cover.

Music No. 1. A name applied to the high-grade music paper, but without any fixed standard.

Music Paper. Medium weight printing paper, generally with English finish; made of soda and sulphite pulps, used for printing of music; cheaper grades for popular sheet music contain mechanical pulp.

Musicroll Paper. Jute manila or sulphite manila wrapping paper, reasonably resistant to contraction and expansion; used for music rolls for player pianos and organs.

Mulching Paper. Coarse wrapping paper used for mulching; paper made from bagasse often used for protection of growing sugar cane; stronger paper, made of bagasse (sugar cane waste) and burlap used for mulching pine apples; used to some extent, when perforated with holes, for protection of tomatoes and other vegetables; such paper is spread over the ground to keep down weeds to keep in moisture in dry climates and to force growth.

N

Napkin Tissue. A sanitary tissue, plain or creped, cut to napkin sizes; often decorated; made from bleached sulphite pulp.

Needle Paper. Black wrapping paper, especially prepared to insure freedom from acids to prevent tarnish; used for making small packages or container to hold a dozen or more needles.

News. A general term applied to a class of papers, made largely from mechanical pulp, soft sized and machine finished and used as hangings or newsprint.

Newsboard. Cheap board, made on a multicylinder machine from printed news; may be combined or solid. **(a)** Combination newsboard is a board, having a news base or center and lined on one or both sides with a higher grade of stock and possessing a smooth surface. **(b)** Solid newsboard is a board made entirely from printed news, when a clean surface is desired, without the use of the liner.

News Vat-Lined Chipboard. A combination chipboard with an outer lining of over-issue news.

Newsprint. Cheap printing paper, made largely from mechanical pulp, soft-sized and machine finished; used for various printing purposes and in cheap tablets.

(Note.—Secretary Mellon, of the United States Treasury Department, on August 29, 1923, issued the following order specifically defining standard newsprint under the Tariff Act: "As the result of an investigation conducted by the Department and conclusions reached, standard newsprint paper, as covered by paragraph 1672 of the free list of the tariff act of 1922, is hereby defined as consisting of mechanically ground woodpulp and chemical woodpulp or sulphite containing not in excess of 30 percent of sulphite and varying in weight not more than 10 percent from 32 pounds to each 500 sheets or 24 inches by 36 inches. This definition is applicable to newsprint paper without regard to the color thereof.")

Nine Point Strawboard. A coarse cheap board made of wheat and other straws; used by corrugated box manufacturers in making corrugated boxboard; corrugated strawboard is faced with jute liner; also used for single-faced corrugated board and corrugated hemp wrappers.

Nitrating Paper. A light weight rag or sulphite absorbent paper; used in the nitrating process for making nitrocellulose compounds; waterleaf paper similar to that used in the manufacture of vegetable parchment; cotton and sulphite pulp also used for nitrating purposes.

Non-Curling Gummed Paper. Specially prepared gummed paper, the body being made as nearly free from stretch as possible; the coating of gum when dry is broken into fine particles by drawing the finished paper over a steel bar to prevent the film of gum from acting as a single surface.

Non-Pasted Blanks. A term applied to coated or uncoated blanks which are usually made on a multicylinder machine and generally vat-lined, such as patent coated, etc.

Note Paper. Flat writing paper, of various qualities and finishes; generally folded. Sizes of paper: 5½ by 8½ inches, Folio note; 6 by 9½ inches, Pocket note.

Notion Envelopes. White manila or colored envelopes; used as a delivery or wrapper for small articles as merchandise; colored sulphite wrapping used to a large extent for this purpose.

Novel News. Heavy-weight rough finish newsprint used for printing cheap novels.

N. Paper. Sortings of writing papers inferior to M. paper; usually contains specks and wrinkles.

Number 1 Bristol. A solid sheet of heavy ledger grade of paper, made wholly or principally of rags, on a Fourdrinier machine, two or more sheets of which are sometimes pasted together to secure desired thickness.

Number 1 Kraft. Colored wrapping paper made wholly of sulphate pulp; usually tests about one point per pound.

Number 1 Manila. Wrapping paper, made principally of sulphite pulp, but containing other fibers, such as sulphite pulp or kraft clippings.

Number 1 Mill Bristols. A cardboard somewhat similar to heavy ledger, but pasted, usually; is generally not quite so high a grade a quality as No. 1 bristol, which see.

Number 2 Bristol. A bristol or cardboard made of lower grades of pulp, but retaining the characteristics of the No. 1 bristol type; made sometimes on a multi-cylinder machine.

ANNOUNCEMENT

Attention of the Paper Industry is Directed to our new line of

CYCLOIDAL VACUUM PUMPS

Designed and Built for Paper Mill Work. Important New Features. All Parts Coming In Contact with Liquid Are Made From Special Acid-resisting Chilled Iron. The Use of Bronze Pumps No Longer Necessary Except for Very Special Conditions. All Parts Interchangeable.

MILLSPAUGH SUCTION ROLLS

Over 1000 Millspaugh Suction Rolls Sold To Date. One Company Ordered 9 Rolls in February. 25 Rolls on Order in our Shop March 1.

The Sandusky Foundry & Machine Co.

SANDUSKY, OHIO.

Member of
Copper & Brass Research Association

Number 2 Kraft. Brown wrapping paper made principally of sulphate pulp, but containing other fibers, such as sulphite pulp or kraft clippings.

Number 2 Manila. Wrapping paper in which mechanical pulp is the predominating material used in its manufacture; manila color or resembling color of mechanical pulp.

O

Oak-Grained Board. A jute or pulpboard, with one liner printed with an oak-grain design.

Oatmeal Wall Paper. A hanging (news stock) paper, having spread upon its surface a coating of wood flour, for decorative purposes.

Offset Paper. Printing paper, specially sized for offset lithography; finish, noncurling and absorptive qualities of importance; should be free from lint and fuzz and is generally slightly antique finish.

Offset Postcard. A bristol or cardboard, made of sulphite and soda pulp, with a vellum finish; used for post cards, or special jobs where it is desired that work will stand out and still show soft finish.

Oiled Board. A tag board or heavy weight water-finished fiber board which has been oiled; used for art stencil, dividers in copy books, shipping stencils, etc.

Oiled Paper. A term applied to wrapping paper that has been immersed in an oil bath, or treated with oil; neutral mineral oil is generally used.

Oiled Stencil. A heavy solid tag board, treated with oil to give it resistance against moisture when used as a permanent stencil.

Oilproof Paper. A specially treated paper, that will resist oil when applied to its surface; such as vegetable parchment.

Oneside Coated Printing Paper. A writing paper, either single or double coated on one side of the sheet.

One-Piece Box. A paperpulp box (carton) consisting of a body with four closing flaps at each end, in which the flaps are a part of the body (not stitched or otherwise fastened on).

Onionskin. Light weight writing paper, thin, transparent and highly glazed. It is made transparent by excessive hydration of stock in the beater, assisted by high finish; durable; used for permanent records where a minimum bulk is desirable. It has also become popular for manifolding purposes; with modified finish, or glazed, peculiarly adapted to typewriting manifolding.

Overpeck Blanks. See Non-pasted blank.

P

Packing Paper. **(a)** Any paper used for packing purposes. **(b)** A felt or oil-treated board, used for packing between castiron joints.

Pails, Paper. Containers in the form of pails or buckets, made of hard fiber, pulpboard or woodpulp; either cut into parts and assembled or molded into shape and compressed; used for packing dry commodities, such as candy, nuts, etc.

Pamphlet Paper. An uncoated or coated printing paper; used for small books without stiff back; used for printing short tracts or articles.

Panel Board. Any heavy board, possessing rigidity and used for panels or backing; hard fiber, cloth board, etc., are examples.

Paperoid. A trade name given to a heavy rope wrapping which is used for large expansion envelopes, for filing legal documents.

Paper Napkins. Tissue paper, cut to sizes suitable for use as napkins; plain or creped and sometimes decorated with fancy printed designs; generally made of bleached sulphite pulp.

Pamphlet Cover. Cover papers of various thicknesses, colors, designs and finishes; used to cover pamphlets, booklets, catalogs and the like; usually being stitched but not bound; originally used as a protection, like manuscript cover; made of varying quantities of rags, soda and sulphite pulp.

Paper Stock Board. Commonly known as chipboard and made from a grade of waste paper known as "mixed papers," made on multicylinder machine, in several qualities; used for a large number of purposes.

Paper Textiles. Various fibers made of light-weight paper which has been twisted into yarn and then woven.

Paper Twine. Narrow strips of sulphite tissue or wrapping paper, twisted into form like twine; paper is moistened just before twisting to preserve the twist; used for tying small packages; made in different sizes.

Paper Yarn. Light weight paper twine; generally made of tissue paper; used for weaving into fabrics.

Papeterie. Writing paper, designed for the box stationery trade; somewhat of the wedding type but less refined; must fold reasonably well for envelopes; made in white and an infinite variety of light tints; usually linen or kid finish; but many special finishes are used.

Paper-Mache. Wood pulp suitable for molding or die-cutting into a variety of articles of merchandise; also used for cupolas, cornices and similar purposes, where light weight is essential.

Paraffin Paper. A sized or unsized paper, passed through a bath of melted paraffin or wax; light weight paper generally used; used for sanitary wrappers and covers.

Parcel Tapes, Paper. Strong jute, sulphite and sulphate wrapping paper, cut to narrow strips, of different widths, and gummed on one side; used to fasten the ends of wrappers and for sealing packages.

Parchment Circles. Parchment paper, cut to circles for use principally as caps or tops for pails, buckets, and jars which hold articles containing moisture.

Parchment Deed. High-grade, heavy-weight writing paper of the bond type, in imitation of genuine sheepskin parchment.

Parchment Finish. Finish of paper resembling genuine parchment; usually produced on a plating machine similar to that used to obtain a linen finish, only instead of cloth, a regular thickness of rippled effect paper is used.

Parchmentizing. The process of treating unsized waterleaf rag or sulphite paper in a bath of sulphuric acid and the subsequent washing and drying of the paper to produce vegetable parchment.

Parchment-Lined Board. Chip and other boards, lined with vegetable parchment, imitation parchment or greaseproof paper to make them grease and oilproof.

Parchment Paper. **(a)** A term used to designate a paper resembling the skin of a goat, sheep and other animals; made by treating a waterleaf rag or sulphite sheet with sulphuric acid. **(b)** A very high-grade, heavy-weight bond paper, in imitation of genuine sheepskin parchment, to be used as a substitute therefor.

Parchmoid (Parchmyn). Trade names for imitation parchment, which see.

Passe-Partout. A strong wrapping paper, gummed on one side and cut into narrow strips and sold in rolls about 2 inches in diameter and 1 inch wide, made in all colors, as well as in the metallic bronzes, black is quite frequently used for the binding of lantern slides though the other colors are frequently used in the mounting of pictures.

Pasteboard. A general term applied to both boards and cardboards that are formed by pasting a liner on cheap stock; popularly used to denote any stiff board or cardboard of medium thickness.

Pasted. A term applied to covers bristols or boards in which two or more thicknesses of dry paper have been pasted together as an operation separate from their manufacture on the paper machine; the different sheets pasted together may or may not be of the same stock; flour paste, starch of sodium silicate (waterglass) may be used as an adhesive.

Pasted Blank. Blanks coated or uncoated, made up of a center stock, usually manufactured on a multi-cylinder machine, to which a sheet of book paper is pasted on each side.

Pasted Board. A group of boards, prepared by pasting together two or more boards or by sheet lining a board.

Pasted Bristol. Bristols in which two or more thicknesses of dry paper, which may or may not be of the same stock, are pasted together as an operation separate from their manufacture on the paper machine. This is generally done by machine but in the case of some wedding bristols hand pasting is used.

Pasted Chipboard. Board consisting a two or more layers of chipboard, pasted together to produce a desired thickness.

Pasted Cover Paper. Cover papers, prepared by pasting together two or more sheets of cover paper; often called double thick.

Pasted Felt. Two or more sheets or plies of felt, pasted together.

Patch Stock. A stiff board, made of jute and a little sulphite; used for eyelets in large open-end envelopes and tags.

Patent-coated Board. A type of cheap board with a white vat-liner on one side.

Patent-coated Manila Board. A manila combination board with a white vat-liner on one or both sides and possessing a high finish.

Patent-coated Newsboard. A combination newsboard, with a vat-liner of white shavings.

Patent-coated Newscenter Manila Back. A board, with a vat-liner of white shavings on one side, a manila back made from manila clippings and a newsboard base.

Patent-coated Solid Manila. A board, with a manila base, made from manila clippings and mechanical pulp and with a vat-liner on one side made from white shavings.

Pattern Board. A light weight board, made of sulphate pulp and rag stock; used for tailors' patterns.

Pattern Paper. A paper used by tailors for making patterns, containing sulphite or sulphate in whole or part, depending upon the strength required; usually black or green in color.

Pattern Tissue. Strong tissue, made of sulphite and rag pulp; usually manila color; used for cutting into forms as patterns of dresses and other clothing.

Pen Carbon Paper. A carbon coated tissue paper, suitable for duplicating writing by means of a pen.

Pergamyn. See Imitation parchment.

Warren Improved Calender Doctors

With flexible blades, universal adjustment and control, Patented

The Doctors can be operated into or off position by limited rocking motion, controlled by hand lever which locks all Doctors by latching into adjustable quadrant.

The pressure applied on Doctors is evenly distributed over every inch of every Doctor alike.

The flexible blades conform to the rolls, giving perfect doctoring effect with minimum pressure. Doctors can be operated on continuously without scoring the rolls.

Improved Warren Patent Double Drum Winders

WITH SLITTER ATTACHMENT

Important Features

Patented Automatic Safety Guard

Grooved and Unequal diameter Drums of Heavy
Construction balanced for High Speed Work

Specifications and quotations gladly submitted upon request

Manufactured By

TICONDEROGA MACHINE WORKS

TICONDEROGA, N. Y.

Phonograph Record Envelopes. A heavy wrapping paper, made of kraft, rope jute or sulphite; made into an open-end envelope, suitable for holding phonograph records.

Photo-Copying Paper. A paper, so sensitized that copies may be made of records, etc., by a photographic process.

Photo Folders. Cover paper, of various thicknesses, designs and colors; used as a mount for photographs and large enough to fold over and protect the picture; usually a double-thick cover.

Photographic Paper. Paper of light to medium substance, for sensitizing for photo printing, fiber practically pure cellulose; free from metallic or other foreign substances; chemically pure; all chemicals used in reduction of fibers absolutely removed, none remaining in sheet except such as are introduced to assist in the sensitizing process; closing superlatively fine; fibers strong when wet.

Photogravure Paper. An English-finish book paper, suitable for use in printing by the photogravure process.

Photo-Mounts. A term used to indicate any heavy paper of board, used to mount photographs; made of newsboard, or pulpboard and lined with a special embossed cover paper; used also for advertising.

Photostat Paper. A sensitized paper, suitable for duplicating records by a photographic method; a trade name.

Picture Backing Board. A double-faced, corrugated strawboard or plain chipboard; used as backing in framing pictures.

Pie Bag. A flat bottom bag, suitable in size for enclosing pies, usually light weight wrapping and of manila color.

Pin Paper. An anti-rust and anti-tarnish paper, either of book stock or a sulphite manila; usually of a blue or black shade; used for merchandising pins in packages.

Pin Tickets. Small pieces of cardboard or tough heavy wrapping paper; having attached thereto a pin or hook, adaptable for fastening to packages or pieces of merchandise; generally used as price indicators.

Plain Blanks. Uncoated, pasted cardboard, white lined on both sides, distinctive for whiteness, stiffness and light edges; suitable for window cards, posters, etc.

Plain Blotting. A term applying to a commercial blotting in original sheets or in cut sizes, before coating, printing or decorating.

Plain Coated Cover Paper. A heavy enameled paper, in cover weights, possessing strength for folding and without printing, embossing or other decorating.

Plain Shell Board. A light weight solid chipboard.

Plain Strawboard. Strawboard without a liner; a certain thickness, called 9 point 0.009), is used for the manufacture of corrugated container board.

Plant Drier. A heavy gray absorbent paper, used by plant collectors, in their field work to press and carry specimens.

Plasterboard. A board made of heavy wrapping paper or felt, with or without gypsum, designed to be fastened to studs or joists and to be used as a backing for the application of plaster.

Plated Finish. A term applied to a high, smooth finish, obtained by the plating process; used chiefly in connection with high grade bristols, bonds and cover paper, and the higher grades of coated lithograph blanks.

Plated Vellum Finish. A smooth finish, to imitate the appearance of vellum; produced by pressure in a plater.

Plate Glazed. A term applied to a high finish obtained by placing sheets of zinc, copper, or smooth hard boards between the sheets of paper to be finished and passing between the rolls of a plater.

Plate Paper. A highly-finished, light-weight book paper, coated one side; suitable for plate printing in colors.

Plater Board. A thick, stiff, smooth board; used in plate-finishing paper.

Plater Finish. A high smooth finish produced by pressing against a smooth plate.

Plate-Wiping Paper. A light weight tag board; used for wiping engravers' plates between impressions; sometimes oiled.

Player-Piano Paper. A tough partly parchmentized paper; used for punching for player-piano records.

Playing-Card Stock. A stiff pasted cardboard, made of sulphite and soda pulp, with a coated and glazed surface; used for playing cards for various kinds of games; usually with a waterproofed surface.

Pleating Rolls. A manila wrapping paper, in long rolls; used by tailors to lay over dress goods during the pleating operation.

Ply. A term used generally to designate a solid web of paper, which when brought together in process of manufacture, or by pasting, builds up a board to a desired thickness.

Point. A unit of thickness of paper or board; equals one one-thousandth of an inch (1/1,000 inch).

Postcard Paper. **(a)** A cardboard, coated or uncoated; used for postcard purposes; pasted or non-pasted book stock for printing illustrated post cards. **(b)** A document manila or tag board made of sulphite, soda or mechanical pulp, with a smooth writing surface; used for postcards or cheap ticket work.

Pottery Tissue. **(a)** A high-grade tissue, generally manila; used for wrapping pottery. **(b)** A strong tissue, used for the transfer of designs to pottery. See Decalcomania.

Press Board. Stiff, hard-rolled, smooth-surfaced solid board, made of sulphate, rags or rope; generally in colors and somewhat resembles vulcanized fiber.

Press Copy Paper. A strong tissue of light weight; used for duplicating work; paper is moistened and placed over type-written sheet and pressure is exerted.

Press Spahn. See Press board.

Printed Fruit Wrappers. A tissue or light weight sulphite wrapper; used for wrapping fruit for storage and shipment to prevent deterioration. See Fruit tissue.

Printed Gummed Tape. Gummed tape, made of book, rope, kraft or manila paper that has been printed.

Printers' Dry Proofing Paper. See Proofing paper.

Printing Papers. A class of papers, made from sulphite and soda pulps, old papers, and sometimes bleached mechanical pulp on a Fourdrinier machine and containing varying amounts of loading material to produce a smooth surface for printing; generally slack-sized; used for printing books, magazines, etc.

Profile Paper. **(a)** A black, rough cover paper; used for making silhouettes. **(b)** A kind of drawing paper used for profile work or levels by surveyors.

Proofing Paper. **(a)** A high grade, smooth finish cardboard; used for making engravers' proofs. **(b)** A cheap book paper or news; used for making galley proofs.

Pulp Barrels. A barrel shaped container, made of molded woodpulp, used for dry commodities such as dyes, etc.

Pulpboard. A board made on a multi-cylinder machine from mixed papers or mechanical pulp; may be combination (filled) or solid. **(a)** Combination pulpboard is a board having a base or center of mixed papers, with a vat-liner on both sides made from manila clippings or mechanical pulp. **(b)** Solid pulpboard is a board made entirely of mechanical pulp.

Q

Quadrille Finish. A fancy finish embodying a pattern of small squares, produced by a plater.

Quarto. The resultant sheet when a sheet is folded or cut into four parts.

Quire. A name given to a group of 24 or 25 sheets of paper; in coarse papers, 24 sheets and in fine papers, 25 sheets are considered a quire; one-twentieth of a ream.

Quirefold. A term indicating that a separate package has been created by the folding of each quire; usually across the short way of the sheet; when folded with the length of the sheet, it is designated as "quirefold long-way."

R

Rag Board. A general term sometimes applied to binders, trunk and similar coarse boards to indicate that they were made principally of the cheapest form of rag stock.

Rag Lining. A light weight wrapping paper, made of mixed papers, news stock or clippings; used for lining cases, boxes or cartons; does not contain rag stock.

Rag Paper. A general term, very loosely used, to indicate that some rag stock or cotton linters was used in its manufacture; term rag-content paper is used for same purpose.

Rag Plate Paper. A plate paper, made principally of rag stock; used for color printing.

Rag Printing Paper. A high grade book paper, made principally of rag stock; used for printing when durability is essential.

Rag Pulp. A form of pulp, made from rags independently of a paper mill and sold to paper mills; used in various grade of book writing and boards.

Rag Wrapping. A term applied to heavy wrapping paper, made of mixed papers, does not contain rag stock and is merely a trade term for a cheap wrapper.

Railroad Board. A white-lined cardboard, with base of over-issue news; made on multi-cylinder machine; used for mailing cards, show cards, tickets, checks, tags and car signs; usually claycoated in various colors on both sides.

Railroad Copying Tissue. A very light weight yellow tissue, made largely of rags; used principally by railroads for making copies of a particular record or trainmen's orders.

Railroad Manila. See Railroad writings.

Railroad Transfer Paper. A colored newsprint; used by city railway systems granting privilege of transfer from one car to another.

Railroad Writings. Writing paper, made from chemical or other wood fibers, hard-sized; finish generally high M. F., varying to low or antique; usually a bright buff or yellow.

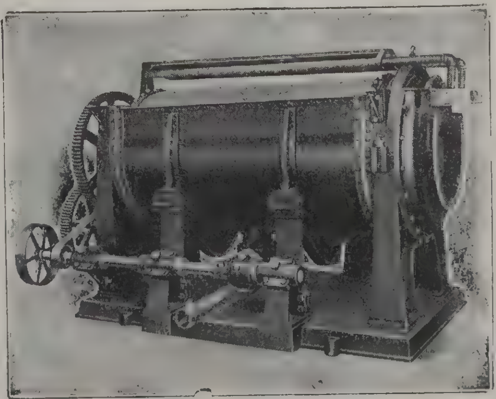
Bird Inward Flow Rotary Screen in Successful Operation on Almost Every Kind of Pulp

Elimination of lumps, strings and slime spots with its wonderful screening principle makes the Bird Screen one of great demand in the Trade, and we have now in operation, about 800 or more. We do not know of one to be found on the second-hand market.

For full particulars address

Thomas H. Savery, Jr.

Suite 1524 Republic Building, Chicago, Ill.



Bird Inward Flow Rotary Screen

Rattle. The sound produced by snapping a sheet of paper between the hands.

Ream. A term used to denote a certain number of sheets of a specified size of paper; used in merchandising and to indicate the basis weight of paper; wrappings and tissues 480 sheets, book news and writings 500 sheets; in proposed standard substance basis, a ream of 500 sheets 25 by 40 inches is recommended.

Record Paper. A high grade ledger paper; durability essential; suitable for county and other permanent records; term derived from that use.

Red Matrix Paper. A thin, compact absorbent paper of red color; used as one of the layers in building up a matrix; sometimes called red rag blotting.

Reel Bands. A board, used in the manufacture of reels or cores; usually straw or chipboard.

Repped Finish. A term applied to paper passed through steel rollers which produce a raised or ribbed surface; may also be produced by felts having heavy warp threads.

Retree. Imperfect papers taken from first sortings; second sortings.

Ribbon Blocks. Straw or chipboard cores, used for the center of rolls or bolts of ribbon.

Ribbon Paper. Narrow strips of paper of different grades; so-called because of its width; generally book paper; used to protect ribbon when rolled or in bolts.

Ripple Finish. A term applied to a finish resembling the ripples on the surface of water.

Rocket Paper. See Candle paper.

Roller Matrix. A matrix mat, molded by being passed through or between a roller and the type form. See Matrix.

Roofing Paper. A general term applied to any material used in waterproofing upper decks of buildings. **(a)** Prepared roofing: Saturated felts, saturated and coated with asphaltum, plain or with crushed slate or other grit imbedded in asphalt-coated surface. **(b)** Built-up roofing: Saturated felts, saturated but not coated with asphaltum, put on roofing decks in plies or layers and coated or built up at the time of application. **(c)** Roofing shingles: Saturated felts, saturated and coated with asphaltum, crushed slate, shell or gravel imbedded into the surface while hot then cut into various styles of shingles.

Roofing Wrappers. A term used to designate papers used for wrapping rolls of roofing or building paper; it may be kraft, sulphite, manila or bogus.

Rope Bag Paper. Bag papers manufactured of rope or bagging stock. See Rope Manila.

Rope Envelope Paper. Envelope papers made of rope or bagging stock.

Rope Manila Paper. Wrapping paper, of manila color, made principally of rope stock, the remainder being free from mechanical pulp. This paper has great strength and is used largely for cement bags, flour sacks, etc.

Rope Paper. Paper made principally of old rope, whether manila, jute or burlap; used for exceptionally strong wrapping for heavy work.

Rope Wrapping. See Rope paper.

Rosin-Sized. A term referring to the addition of rosin to the beater to produce sizing effect. See Sizing.

Rotogravure Paper. Highly-finished, uncoated printing paper, often made of bleached mechanical pulp; used for printing by the rotogravure process.

Royal. A size of paper, 19 by 24 inches.

Rubber-Stamp Mark. A mark similar to a watermark, but impressed in the damp paper on the machine from a rubber band on the press rolls or baby drier, usually on grades made rapidly.

Rugs, Paper. An article made of paper, cut to narrow widths in rolls, twisted to resemble twine and woven into rugs or carpets; paper is treated to resist moisture and colored for decorative purposes.

S

Sack Paper. A general term to designate papers used in the manufacture of paper bags; it is generally a rope, crepe, manila or sulphite stock.

Safety Paper. Strong writing (bond) paper that has been sensitized, either by additions of chemicals in the beater, or by special printing in a manner to disclose alterations; used for checks, drafts, railroad tickets, premium coupons or any negotiable certificate of value.

Salesbook Paper. A book or bond paper, of various colors; made up into books for sales record; used in connection with carbon paper to make several copies.

Sandpaper. A good grade of manila or unbleached rope, coated with a mixture of fine sand and glue; base paper should be pliable and durable; used for polishing and cleaning purposes. See Abrasive paper.

Sandwich Bags. Small bags, sometimes of glassine, suitable for enclosing sandwiches.

Sanitary Containers. Sulphite container board stock coated with paraffin, spirally wound into cylindrical cans; made in various sizes from one-quarter pint to half-gallon; crimped flange top and bottom, with fitted lids; suitable for liquid or semi-liquid food stuff.

Sanitary Tissue. A general term applied to a group of tissues which are absorbent, bulky and generally of rough finish, such as napkins and toilet tissues.

Sanitary Wrapping Paper. A term applied to a group of wrapping papers, prepared from sulphite or Mitscherlich pulp by mechanical action in the beater. This term is also used to cover the converted product prepared by treating paper with paraffin, sulphuric acid or other materials.

Satin Folding Bristol. A cheap grade of stock resembling translucent, but with a manila or dark base; particularly adapted for folding purposes.

Saturated Felt. A porous bulky chipboard or rag wrapping; treated with tar or asphaltum; used for roofing purposes. See Roofing paper.

Saturating Felt. A felt which is used as a vehicle to carry and hold various tars, asphaltum or other waterproofing compounds; sometimes designated as waterproofing felt.

Sealing Tape. Manila or No. 1 kraft, gummed on one side and put up in rolls of narrow width. See Paper parcel tapes.

Sealing Wrappers. A heavy mill wrapper, made of Mitscherlich or sulphite pulp; high-finished; sometimes duplex in color; used for sealing ream packages of book and writing paper.

Screenings. **(a)** Drab-colored wrapping paper, made of partly cooked pulp, broke pulp screenings and seconds; frequently full of specks or dark spots; used for cheap wrapping and packing purposes; sometimes machine-glazed. **(b)** A general term used to designate paper made of partly cooked pulp; broke screenings and seconds; frequently full of specks or dark spots, as well as long slivers of wood; it is used for cheap wrapping and packing purposes.

Seaming Cords. A cord, made of narrow strips or rolls of sulphite or kraft paper, twisted into a twine or cord; used as such within a covering of leather for the borders of leather seats in automobiles, etc.

Seconds. Imperfect sheets; sortings.

Second Sheets. **(a)** A term applied to typewriter paper of the same character as the letterhead used, but blank; used for continuation of letter that will not go on one page. **(b)** Sometimes used to refer to light-weight manifold paper, on which carbon copies of letter are made at time of writing.

Seed-Germination Paper. A blue absorbent paper, the dye of which does not bleed or run when sheets are wet; used by seed men to grow seeds upon, with a view of ascertaining the percentage of propagation.

Seidlitz Paper. A term given to lightweight paper, specially treated; used for packing seidlitz powders; usually in blue and white.

Self-Sealing Paper. Wrapping paper, having a coating of paraffin, which when heat is applied, will stick; used principally on food packages.

Semi-Kraft. A wrapping paper, made of sulphate and sulphite, duplex in color; kraft on one side and manila or colored fiber on the other.

Semi-Vulcanized Board. An imitation of vulcanized fiber board; usually hard and stiff and made of all jute stock.

Shank Board. Woodpulp, chemically treated, mixed with leather clippings, run on wet machines and highly compressed; used in shoes as substitute for leather.

Sheathing. Building papers, used between rough boards and finish in outside walls of frame buildings, for portection against wind and dust; closely felted and relatively compact.

Sheet-Calendered. A term applied to a process of finishing paper in which the sheets of paper are passed through a calender stock, but not in a continuous web.

Sheeting Paper. News or book paper, used for the sheet lining of chip and straw boards.

Sheet-Lined Chipboard. Chipboard, which has been lined, after being cut into sheets.

Sheet-Lined Strawboard. Strawboard which has been lined after being cut into sheets.

Shelf Paper. News, book or sulphite bond paper, cut in sheets, often with decorated or lace paper edge; used for lining shelves or cupboards.

Shell Packing. See Cartridge paper.

Shell Paper. See Cartridge Paper.

Shells, Paper. See Cartridge paper.

Shipping Cases, Paper. Cases, cartons or shipping containers made of soild fiber boxboard or corrugated boxboard; used for shipping merchandise.

Shirt Board. Chip or newsboard; used by laundries to place in shirts to keep ironed shirts protected from wrinkles. See Laundry boards.

Shirt Protectors. Shirt board, with a sheet of glassine pasted to the edges; used as an enclosure for laundered shirts as protection.

Shoe Board. Hard fiber board, or highly compressed pulpboard, made of woodpulp and leather clippings; used in the construction of soles and heels as a substitute for leather.

Shopping Bag, Paper. A paper bag, made of strong, heavy rope or kraft wrapping and having a handle attached for convenience in shopping. See Carry bag.

Showcard Board. A cardboard, made of over-issue news and colored; lined on one side with a book paper and coated one side; used for window and counter display signs.

Silk Board. A stiff heavy chip or binders board; used as a substitute for wood, about which to wrap cotton or silk fabric into a bolt.

Silk Wrapper. A duplex (buff and white) light weight cardboard or cover paper; used for wrapping bolts of silk fabric.

Silver Express. Pearl or gray, water-finished sulphite or sulphate wrapper; used for the same purposes as ordinary express or drab express wrapping.

Silver Tissue. A white anti-tarnish tissue; made of rags or sulphite; used for wrapping silver.

Single-Coated Printing Paper. Printing paper, having a light coating of clay on one or both sides; used for screen cuts not the highest degree of fineness.

Single-Faced Corrugated Board. A corrugated straw board, faced on one side only with chipboard or bogus wrapping; used for protection of glassware and other packing purposes.

Single Feather Edge Board. A board, having but one feather edge; other edge of the same thickness as body of board.

Single Manila-Lined Board. A boxboard, with chip base (made of mixed papers) with a manila liner made of manila clippings; used for folding cartons, butter and lard traps or plates, signs, etc.

Single Manila-Lined Newsboard. Manila board, lined with news back, clay coated on manila side in white and colors.

Single News Vat-Lined Chipboard. A chipboard, vat news lined on one side only.

Single-Thick Cover. A cover paper of a single thickness of paper not pasted.

Single White Vat-Lined Chipboard. A chipboard, vat-lined on one side only, with pulp of white shavings.

Sized and Supercalendered S. & Sc. See Supercalendered.

Sizing. A term applied to the resisting qualities of paper when ink or water is used; sizing quality is produced by the addition of rosin or other similar materials to the beater, or by tub-sizing with glue or starch.

Sketching Paper. A very rough, white or manila writing paper for rough sketches; seldom of permanent value.

Slack-Sized. A term applied to paper containing less than the usual amount of sizing, depending upon the uses of the paper; not generally applied to waterleaf sheet.

Slates, Paper. Thin paper or cardboard coated with a black composition, used as a substitute for slates in schools.

Slaters' Paper. A tarred felt or sized sheathing used under slates in the roofing of buildings.

Slitting Paper. Paper in jumbo rolls and rolls of large diameter and in various widths; used for slitting or cutting down to smaller size rolls.

S. M. P. L. Chip. Single manila print lined chipboard; made of mixed paper or chip base, with a liner of printed manila clippings; used for cheap folding cartons, butter and lard trays that are paraffined, etc.

Soda Pulp. Broadleaf wood (poplar, gum, basswood, etc.) cooked by the soda process; usually bleached; a short fibered bulky pulp, used in blottings, book, cover and writing papers.

Solid Boards. A group of boards that are made of one grade of beater-prepared stock in one process or operation.

Soap Wrappers. Manila, water-finished fiber or waxed paper; used for wrapping individual bars or cakes of soap; when used without treatment, paper must be free from mechanical pulp to prevent discoloration by the soap.

Solid Bristol. A term applied to index or mill bristols which are made of homogeneous stock in one operation.

Solid Cardboard. A term applied to any cardboard that is made in one operation on the multi-cylinder papermachine.

Solid Jute Board. A board, made entirely of jute stock, without liner or filler.

Souffle Cups. Small cups made of white sulphite writing paper; cut or embossed with fancy designs; used for serving small portions of foods or sweets.

Specialties. **(a)** Converted paper articles, not commonly used; as distinguished from the standard uses; **(b)** Grades of paper, made in small runs, of special colors, etc.

Spinning Parchment. A specially treated parchment paper of lightweight, usually red or pink in color; used to make small rolls about one inch wide for use in connection with the French system of mule spinning of worsted goods.

Starch Paper. An absorbent paper, treated with starch; used as an indicator paper in chemical laboratories for the presence of traces of free iodine.

Steam-Dried Binders Board. Binders board that has been made on a multi-cylinder machine and dried on steam-heated cylinders, as contrasted with air-dried board that is made on a wet machine and air-dried.

Steam Finish. A finish obtained by means of a steam spray on the machine calenders or on the supercalender.

Streamers, Paper. White and colored tissue paper, cut to narrow width rolls for hand use; used principally at carnivals or for decorative purposes.

Steel Plate Paper. A high grade paper of exceptionally uniform surface used for steel plate engravings.

Stencil Board. A water-finished, cylinder-made sulphate board; used for making stencils for shipping purposes.

Stencil Paper. A paper, used for cyclostyle, mimeograph or other duplicating machines; made by impregnating strong tissue paper with paraffin or other suitable materials.

Stenotype Paper. Book paper, in small rolls or folds, used on stenotype machines.

Stereotyping Tissue. Extra strong tissue, made of rags or sulphite; used as a facing in the production of matrix mats for printing purposes.

Stock Sizes. Common sizes, usually carried by producers, distributors or consumers; sizes that are standard and which are reordered from time to time.

Strawboard. Cheap coarse board, made on a multi-cylinder machine from incompletely cooked straw; may be combination or solid. **(a)** Combination strawboard is a board, having a straw base or center and lined on one or both sides with a higher grade of stock and possessing a smoother surface. **(b)** Solid strawboard is a board made entirely from straw pulp.

String-Inserted Waterproof. A built-up, heavy wrapping paper, consisting of two sheets of kraft or manila paper, with coating of asphaltum in center and with cotton or jute string inserted in the center coating, spaced about three-eighths to half an inch apart.

Suit Boxboard. A combination board, of chip base with jute liners, possessing strength and rigidity.

Straw Wrapping. Coarse wrapping paper, made of wheat or rye straw; used by packers and butchers for wrapping meat and for lining wagons in which meat is delivered.

Substances. The weight of a sheet of book or writing paper; book paper weights are on basis of ream 25 by 38 inches, while writings are on basis of 17 by 22 inches; proposed substance is on a basis of ream 25 by 40 (1000 square inches) for all classes of paper.

Suitcase Board. Pasted chipboard, oak-grained on one side and reverse lined with imitation leather paper, used for making suit cases and sample cases.

Sulphate Paper. Paper made wholly or principally of sulphate pulp. See Kraft paper.

Sulphate Pulp. See Kraft pulp.

Sulphate Wrapping. A brown wrapping paper made wholly of sulphate pulp.

Sulphite Bag Paper. Bag paper, composed wholly or principally of sulphite pulp, either white or manila color.

Sulphite Board. A pulpboard, made entirely of sulphite pulp.

Sulphite Bond. Paper of the bond type, made from wood fibers, the chief component being bleached sulphite pulp.

Sulphite Manila. A manila wrapping paper, made wholly or principally of sulphite pulp, but colored to resemble manila.

Sulphite Paper. Paper made wholly or in large part of sulphite pulp.

Sulphite Pulp. Woodpulp produced by a chemical acid process using a mixture of sulphurous acid and lime; coniferous woods, such as spruce, hemlock, fir, etc., generally used in this process; gives a long and strong wood fiber.

Supercalendered Finish. A finish of book and other papers, obtained by glazing the paper by passing it through a series of rolls of paper, cotton or chilled iron, with or without heat; rolls rest upon each other in the form of a stack and the bottom roll is driven; the iron rolls alternate with either cotton or paper rolls.

Supercalendered Book Paper. Machine finished book paper that has been passed through a series of rolls of paper, cotton or chilled iron (called a supercalender), and given a high or glazed surface.

Supercalendered Cover Paper. A kind of uncoated cover paper that has a high or glazed surface, obtained by having been passed through a supercalender stack.

Superfine Writings. A high or superior grade of fine flat writings; usually with a high finish frequently modified to suit a diversity of uses and tastes.

Super Finish. A term applied to a finish of an uncoated paper, which has been given a glazed surface. See Supercalendered.

Super Glazed. A comparative term applied to an unusually highly glazed surface of paper.

Super Royal. A size of paper, 20 by 28 inches.

Supplement. Sheets of book paper, added to the end of a printed book.

Surface Coated. A term applied to any paper to which a coating of any kind has been applied to the surface; distinguished from a coating applied by passing the sheet through a bath.

Surface Sized. See Tub Sized.

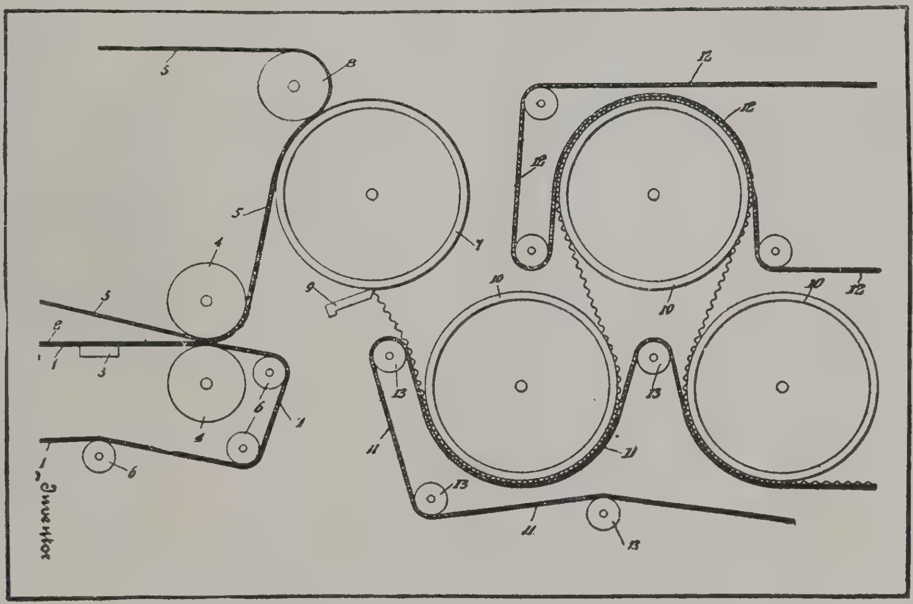
Surgical Dressings. A thin web of pulp, made in layers, generally creped; sterilized and used by surgeons for its absorbent qualities. See Cellucotton.

Improved Process of Creping Papers

Automatic Attachment
The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Creped Wrapping Papers

The Method Has No Equal



The crepe being formed while the fibres are **steaming hot and pliable, is automatically passed to the dryers and dried without stretching;** not only retaining form better, but shedding less lint than cold creped paper products—a **Superlative System.**

For particulars address:

TOMPKINS - HAWLEY - FULLER CO.

VALATIE, N. Y. or OREGON CITY, ORE.

Syphon Paper. A medium weight writing paper, of smooth surface; slit and reeled into rolls ⅝ inch wide and from 6 to 8 inches in diameter; used in connection with syphon recorders at telegraph cable terminals, for recording messages automatically in a special kind of marks.

T

Tablet Blotting. A sheet used on the front of tablets, between the cover and the writing paper; sometimes printed with black lines and included in a box of papeterie, to be placed beneath the sheet of writing paper to make it easier to write in a straight line.

Tablet Board. Chip or strawboard; used as a stiffener for the backs of tablets.

Tablet News. Newsprint, usually of rough surface suitable for pencil writing; used in cheap tablets.

Tablet Paper. Book paper, sometimes containing mechanical pulp; sized for writing purposes; used in the manufacture of tablets; other grades also used, such as news, writings and bonds.

Tack Board. A term applied to a lightweight, stiff, gray or black solid chipboard; used in the construction of tack boxes.

Tag Blanks. See Tag board.

Tag Board. Various weights and qualities of a manila colored cardboard; made of mixed papers, mechanical pulp, sulphite or rope stock; used for the manufacture of various kinds of shipping tags; generally has a printing or writing surface.

Tag Envelope. An envelope, so constructed of heavy document manila that it may be used both as a tag and for enclosures; used in connection with shipping, for enclosure of special instructions; as for installation of electric motors, etc.

Tape, Paper. Paper made in narrow widths in rolls for a variety of purposes; many grades of paper used.

Tapping Board. Hard fiber, leather or sulphite pulpboard, used in the construction of cheap shoes.

Tar Board. A cloth board, containing tar and hard rolled; generally used for high grade book covers.

Target Board. Stiff binders board, one side covered with olive drab lining, reverse side covered with news liner; used for field targets on government rifle ranges.

Tar Paper. See Tarred Felt.

Tarred Felt. A building felt, saturated with tar; used in the construction of buildings, etc. See Saturated felts.

Tea Paper. Colored sulphite wrapping paper; used in making a container for individual packages of tea.

Telegraph Manila. A cheap yellow-colored manila writing paper, made of mechanical pulp or sulphite pulp; sized for writing; used for the writing of telegraph messages for transmission and delivery and for railroad waybills, etc.; called chemical manila when made from chemical fibers; called railroad manila and manila writing when mixed with mechanical pulp.

Templet Board. Hard-rolled press board, made of mixed papers on wet machine; made in large sheets; used by foundries and machine shops for making templates and patterns.

Test Board. Chip or jute lined board; used in the construction of shipping containers to conform to definite strength specifications.

Test Jute Board. Solid board made wholly or principally of sulphite or sulphate pulps, the strength of which meets specific requirements for special uses.

Test Chipboard. A solid chipboard, which must conform to definite strength requirements when used in the manufacture of containers for interstate transportation.

Text. High grade uncoated printing paper, with smooth but dull finish, of good texture and appearance. This paper is often made with some rag stock and is used chiefly in the production of high grade or expensive book.

Textile Spools, Paper. Spools, cones or cores, made from a combination board of light weight chip base stock, with surfaces of vatliners of a desired color; used for winding yarns.

Textile Tissue. Strong colored tissue paper, cut into strips and twisted into thread or yarn for making paper textiles or fabrics of light weight.

Three-Piece Box. A paper pulp box (carton) consisting of a body piece with separate ends attached to the body by means of flanges. The ends may be attached inside the body with the flanges projecting outwards (recessed end) or either inside or outside of the body piece with the flanges projecting towards the body (capped end).

Thick China. A coated non-pasted cardboard, coated two sides; made of overissue news, on a multi-cylinder machine; carried in an unusual variety of colors; particularly adapted for theater tickets; practically a railroad board in light weights.

Threaded Felts. A heavy sulphite or sulphate wrapping, to which has been applied a coating of asphaltum and covered with yarn, running one or both ways across the sheet; exposed, or covered with another sheet of the same or different kind and weight of wrapping paper.

Ticker Tape. Narrow rolls of white book paper; used on ticker machine to indicate market and stock report.

Ticket Board. Bogus bristol, thick china or cheap sulphite board; used for various ticket purposes.

Ticket Paper. Bristols, translucents or tough check; used by railroads for tickets; sometimes specially treated or coated to prevent counterfeiting; also a good grade of writing paper or bond, which may have the safety feature.

Ticket Stock. Coated board, same colors as tough check but with a base of news.

Tinfoil Paper. Paper coated with tinfoil, the latter being tin in a finely divided state and pasted on the surface of the paper; used for decorative wrapping and preservative purposes.

Tire Containers. Receptacles made of cheap boxboard; used for packing and transporting rubber inner tubes.

Tire Wraps. Plain kraft, waterproofed wrapping or case lining paper, or string-inserted waterproofed wrapping; in 50 or 100 yard rolls from 1½ to 6 inches wide; used for wrapping tires. See Automobile tire wraps.

Tissue Manila. Manila colored tissue, often made of manila or jute fiber, rag or sulphite.

Tobacco Paper. Manila or colored sulphite and mechanical pulp wrapping paper, sometimes coated; fairly bulky but pliable and soft, so that when used as a container for plug cut or other smoking tobacco, the package when felt will give the impression of containing fresh tobacco.

Toilet Tissue. Tissue paper, made of mechanical pulp or sulphite; creped, smooth or rough finished; sometimes impregnated with small quantities of a waxy substance; finished in rolls or sheets and used for toilet purposes.

Tissue Paper. A general term indicating a class of papers made in weights lighter than 10 to 12 pounds, 24 by 36, 480; made on Yankee or Harper machine generally, or on a single-cylinder machine, glazed or unglazed; of rag, sulphite or rope; used for a large variety of purposes.

Toned Printings. A term applied to a shade or tint of book paper bordering on buff; the natural color of bleached woodpulp.

Tooth. A term used to denote the depressions between the fibers or groups of fibers in the surface of a sheet of paper; refers principally to drawing papers and papers of low finish.

Tough Check. A strong cardboard, made either of rope stock or extra quality strong unbleached sulphite on multi-cylinder machine; coated; used for tickets and tags, where strength is essential; usually coated on both sides.

Toweling. A light weight absorbent paper made of woodpulp or waste papers; creped or crinkled; used as a substitute for cloth towels.

Towel Paper. See Toweling.

Tracing Paper. Transparent, thin, lightweight writing paper; used for tracing original drawings or plans; its transparency makes possible blueprinting these tracings.

Tracing Tissue. A tissue paper of considerable strength and transparency, used for tracing patterns and drawings.

Trademark Paper. Paper containing a mark in the sheet, used primarily to distinguish it from any other paper and to conform its ownership.

Transparent Paper. (a) Cheap news in various colors; used for street railway transfers. (b) Light-weight tissue or book paper, on which is printed a design or colored picture for transfer to some article; includes embroidering transfer pattern, pottery tissue, decalcomania paper, etc.

Translucents. A soft cardboard, pasted or non-pasted, made of soda pulp with both sides clay coated; used for booklet covers, window hangers, cards, etc.

Transparent Manifold. A very thin manifold paper for use with duplex carbon; transparent, so as to be read through.

Transparent Paper. A general term applied to thin paper through which can be seen an object against which it is held.

Trimmed. A term applied to paper that is cut or trimmed on two or more sides to insure exactness of angle.

Trunk Board. A stiff binders board, made in large sizes; used in the construction of trunks. See Binders' board.

Trunk Wrapping. A heavy sulphite, kraft or rope paper.

Tube Board. Strawboard or chipboard; used for winding either straight or spirally into form of a tube; used for mailing or container purposes.

Tub-Sized. A term applied to paper which has been passed through a bath of glue or starch, and subsequently air or loft dried; the glue or starch improves the quality of the paper, as well as the sizing quality; used in treatment of bonds, writings, ledgers, etc.

Turmeric Paper. Absorbent filter paper, treated with extract of turmeric root; used in chemical laboratories to indicate the presence of small quantities of acid by a change of color.

Twisting Paper. Either strong tissue or wrapping; used for the manufacture of cords, twines, and yarn; also in the manufacture of carpets, rugs, furniture, woven paper fabrics and bags, etc.

Two-Sides Coated Printing Paper. Printing paper, either single or double coated on both sides of the sheet.

Tympan Paper. Paper used by printers for packing between the cylinder or the platen and the sheet in printing process; it is always finished in rolls, in widths equal to the standard widths of the printing press and is generally a stiff manila colored wrapping, oiled or uncoated, made of jute, manila and sulphite.

Typewriter Manifold. Light weight paper of bond character; made of rags and sulphite; used in 7, 9 and 13 pound weights for making a number of carbon copies at one time on the typewriter.

Typewriter Paper. Bond and writing paper, cut 8½ by 11, 8½ by 13, and 8½ by 14 inches in size; packed in ream boxes and sold as typewriter paper; used in 13, 16, 20 and 24 pound weights; made of rag, sulphite, soda and cotton linters.

V

Varnish Label Paper. Uncoated printing paper, made for label purposes, sufficiently sized to withstand a coating of varnish after printing.

Vat-Lined. A term designating the process of applying a liner to a board or cardboard, by use of a multi-cylinder machine, by having a different stock in the first or last vat.

Vat-Lined Chipboard. A chipboard, having a liner formed in the process of manufacture on a multi-cylinder machine, of a different color or quality than its center or filler; liner made on a different mold than the filler and all the plies brought together while wet and compressed at the press rolls.

Vat-Lined Strawboard. A combination strawboard, vat-lined with mixed paper stock.

Vat Paper. An English term applied to paper made on a cylinder machine, on account of the vats in which the cylinder mold revolves.

Vegetable Parchment. A term applied to waterproof, greaseproof and partly transparent paper, produced by passing a waterleaf sheet, made of rags or sulphite, through a bath of dilute sulphuric acid and immediately washing; used as a sanitary wrapping.

Vellum Finish. A term used to describe or indicate any paper or cardboard finished as vellum; obtained by the calendering or plating process.

Vellum Paper. A high grade natural or cream-colored heavy paper similar to ledger, except that it has a slick or oily appearing finish, produced by the use of oils; used for diplomas, embossed resolutions, marriage certificates, etc.

Velvet Finish. A term applied to a finish given to paper or cardboard and so named because of its similarity in feel to velvet; a low antique finish, dull in surface.

Veneer. Thin pulp or fiber board, or heavy ledger, highly glazed and used for coverings.

Visor Board. Jute board, made of strong sulphite pulp, having good bending qualities; used for making cap visors.

Vulcanized Fiber. Often called hard fiber; paper or board rendered hard and waterproof; waterleaf paper is passed through a bath of strong zinc chloride solution and washed; several sheets pressed together while wet into a hard compact mass, used for various fabricated articles such as washers, etc.; also used as backing board.

Vulcanized Paper. A paper or board which has been treated with a strong solution of zinc chloride. See Vulcanized fiber.

Vulcanizing Paper. A waterleaf sheet, made of rags or sulphite to be treated in a zinc chloride bath in the manufacture of hard fiber and other vulcanized paper products.

W

Wad Paper. Chipboard, used to cut into small disks and used in shotgun shells.

Wallboard. **(a)** Heavy board, composed of a number of layers of chip, binders, or pulpboard, molded or pasted together and generally sized, either throughout or on the outer surface. **(b)** A composition material used as substitutes for lath or for lath and plaster in the construction of partitions, side-walls and ceilings in interior construction; commonly known as asbestos wallboard, gypsum wallboard, gypsum plaster board and wallboard made entirely of old papers or woodpulp.

Wall Paper. Heavy paper, made largely of mechanical pulp, similar to newsprint or otherwise, is used as a covering for interior walls and ceilings for decorative purposes; high grades of wall paper are made of better quality of stock.

Washers, Paper. Disks, with a round center hole, made of hard-rolled chipboard, tar board or hard fiber; used for various purposes as a substitute for metal washers.

Watercolor Paper. A drawing paper with a surface more pebbled than ordinary; pebbling slightly tending toward a geometrical pattern; faintly resembling prepared canvas for oil painting; sized hard; surface firm but not "greasy"; watercolor when applied should not flow, neither should the paper rob the color of its brilliancy.

Water Finished. Paper that has been highly glazed or finished by the action of the machine or supercalenders on the surface of the sheet which has been moistened immediately before entering the rolls of the calender; also applied to highly glazed wrapping paper, obtained by being calendered on a calender stock equipped with "water boxes," and compound levers to increase the pressure on the rolls, while the paper is being calendered.

Water Finish Sulphite Wrapping. Sulphite wrapping paper, made wholly or principally of sulphite pulp, and moistened before passing through the last stack of calenders on the paper machine to produce a glazed surface.

Waterleaf Paper. A kind of blotting paper, used for conversion by chemical processes into vegetable parchment, vulcanized fiber, etc.; the term waterleaf is sometimes used in connection with filter paper and commercial blottings.

Watermark. **(a)** A term applied to a distinctive mark or design; produced by the raised pattern on the dandy roll or the wet sheet before going to the couch roll; includes the laid mark. **(b)** A term applied to a distinctive mark or design produced by raised design on rubber rolls, pressing against the sheet as it goes over the first dried or baby drier.

Waterproof. A term applied to any paper or board that has been heavily sized or treated to resist moisture; indicates that water or moisture, under ordinary conditions, will not penetrate within a limited time; this is a relative term.

Waterproofing Felt. A paper used for building purposes which is treated to render it waterproof.

Waterproof Bag. A paper bag made of duplex kraft with center of asphaltum.

Waterproof Sheathing. Sheathing paper made wholly or partly impervious to moisture by extra sizing during manufacture or by later treatment.

Waterproof Wrapping. A term used to designate paper which has been coated with asphaltum, or a duplex sheet filled in the center with asphaltum to make a highly waterproof sheet; it may be used as a wrapping paper or a case lining to protect the contents against moisture.

Waxed Paper. A wrapping paper that has been passed through a bath of wax or paraffin or that has been coated or treated with wax or paraffin; generally used for various wrapping purposes.

Waxed Tissue. Tissue paper that has been waxed; used for sanitary purposes.

Waxing Paper. Any paper, which may be treated to produce waxed paper; should be sufficiently slack sized to absorb the wax or paraffin.

Wax Stencil. Stencil paper of board, that has been coated with wax or paraffin.

Waybill Paper. Light weight yellow or pink writing paper, made of sulphite and mechanical pulp; used for railroad waybills.

Web-Calendered. A term referring to a process of finishing paper in which the paper is passed through a calender stack in a continuous sheet or web.

Web News. A term used to indicate news print in rolls or a continuous web.

Wedding Bristol. High grade bristols made by pasting together two or more sheets of finished or unfinished paper of rag content in different thicknesses or plies; plated to give various finishes; used for cards, announcements, etc.

Weddings. Superfine writing papers of medium to heavy substance, slightly modified for better folding; exceeding delicacy of texture; finish usually of the vellum or kid style, i.e. smooth to the touch but lacking in sheen or glare; may carry other finishes, as high plate or linen; particularly adapted to steel engraved wedding announcements; frequently used for social correspondence.

Weight. A term used to indicate a quantity of paper; has special application as a term used to indicate the basis of a single sheet of paper, in terms of the actual or nominal weight of a ream of that paper, of some standard or arbitrary size. See Basis weight.

Well-Closed Formation. An even regular formation of the fibers, producing an even, uniform appearance to the sheet as opposed to a wild formation which gives a mottled, cloudy appearance.

Western M. F. Book. A term applied to book paper made in other than the Eastern States; it was thought that such paper had somewhat different qualities than similar paper made in the East; usually contained less soda pulp and more sulphite and in some cases contained white shavings; applies usually to cheaper grades.

Whalebone Paper. A stiff, hard-rolled, chemically treated jute board, resembling fish paper; used as a substitute for whalebone in stays and corsets for insulating purposes.

White Divider Board. Cardboard, made of over-issue news and sulphite; white colored throughout; used for separating candy layers.

White Mill Blanks. Cheap cardboard, made of over-issue news and white shavings; used for cheap advertising and window decorating.

Paper	270,000 lbs.

Mills and General Office:
Rothschild, Wisconsin

Sales Offices:
1126 Conway Bldg., Chicago, Ill.

HAVE YOU A PAPER PROBLEM?

White Fiber Sheathing. Sheathing paper, made entirely of Mitscherlich pulp, highly sized and with hard surface.

White News Mill Lined Strawboard. A strawboard, which has been lined with newsprint, while yet in the roll and before leaving the paper machine.

White Sulphite Paper. A term applied to a paper, made of bleached sulphite pulp, having strength and good appearance.

White News Sheet Lined Strawboard. Strawboard, which has been lined with newsprint after leaving the paper machine and cut into sheets before lining.

Wild Formation. An irregular formation of the fibers, producing a cloudy or mottled appearance in the sheet; particularly noticeable in long fibered papers, such as kraft.

Willesden Paper. Any paper, treated with ammoniacal solution of cupric oxide, which produces a gelatinous effect on the surface, somewhat resembling parchment.

Wiping Paper. A paper, used for wiping or cleaning type; generally a butcher's manila or smooth surfaced wrapping.

Wire Mark. A term applying to the surface given a sheet of paper by contact with the wire on a paper machine; generally a diamond or square shape.

Wire Side. That side of a sheet of paper which has come in contact with the wire of the paper machine, during the process of manufacture

Wire Wraps. Duplex, anti-tarnish paper, kraft on one side and green or blue on other side; used for wrapping rolls of wire.

Woodpulp. Pulp made from wood and suitable for making paper; produced by one of three chemical or one mechanical process; such as soda, sulphite, sulphate and mechanical pulp.

Woodpulp Board. Woodpulp board, commonly known as pulp board, is used for various purposes such as tablet backs, pie plates, cake boards, cracker layer board, set-up boxes, etc. **(a)** Filled: made from mixed papers with vat-liner on both sides made of manila clippings or mechanical pulp. **(b)** Solid: made of mechanical pulp.

Wove. A term used to indicate that in making a cover, wiring or bond paper, a dandy roll was used with a cover similar to Fourdrinier wire (instead of a "laid" dandy), in order that the two sides of the sheet might be nearly alike. See Laid.

Wrapping Tissues. Tissues whose chief characteristics is toughness and, in some cases, freedom from chemicals likely to produce tarnishing effects.

Wrapping Paper. A general term applied to a class of papers made of mechanical pulp, sulphite, sulphate, straw, rope, jute, burlap, old rags and mixed papers, and used for wrapping purposes as a container or protection; may be made on Fourdrinier, cylinder or Yankee machine.

Writings. A class of fine papers made on the Fourdrinier machine, from rags, cotton linters, sulphite, soda pulp, etc.; hard sized and suitable for conversion by printing, ruling, folding or other methods, for use with pencil or pen and ink for commercial or social purposes.

Y

Yarns, Paper. Paper or tissue twisted in a manner suitable for weaving into carpets, rugs, bagging, paper fabrics, etc.

Yellow Waybill Copying. Yellow copying tissue of sulphite, jute or mechanical pulp; used for duplicating railroad waybills.

Z

Zinc Liner. Refers to the use of zinc plates on top and bottom of each sheet of paper in making the plater "book." A zinc plate, cloth, paper, etc., are used. In the ordinary plate finish, a zinc plate is used only at the top and bottom of the book. The use of a large number of zinc plates puts a deeper finish on the paper; in fact it actually cuts into the fiber.

Detection of Animal Size in Surface Sized Papers

By F. T. CARSON*

IN the manufacture of surface-sized paper there are but two materials used in appreciable quantities as tub-sizing agents, viz., animal glue or gelatine and starch. The former is usually referred to as animal size. Aside from its primary function the sizing agent produces secondary effects on the physical qualities of the paper, such as improvement in the strength, rattle and feel, the effect being different according to the sizing agent used. Owing to the somewhat intangible nature of certain of these properties it is often impossible to express completely the quality of a sheet of paper by physical tests alone. It is customary, therefore, to specify the component materials which enter into the manufacture of the product. In the case of surface-sized papers the kind of size used is specified in lieu of satisfactory physical tests definitely to predetermine the suitability of a given paper to a given use. Whether starch or animal size has been used in the tub-sizing process is sometimes difficult to determine. The simple test with iodine in potassium iodide solution is used to detect starch. The detection of glue, however, involves some uncertainty for the reason that certain starches give a precipitate or otherwise interfere with the test for glue by the usual procedures. In fact it is maintained that "when either casein or starch is present there is apparently no means of proving the presence or absence of glue."[1]

Precipitate With Starches

Several qualitative tests for glue have been used, the most common of which is the reaction with tannic acid. Certain starches, however, give a precipitate with tannic acid which is very similar to that given by glue. Griffin[2] recommends that the starch, if present, be hydrolyzed by heating with hydrochloric acid on a steam bath before adding the tannic acid. It has been observed also that boiling the tannic acid precipitate will aid in differentiating between the two materials. If due to starch the precipitate will dissolve and reappear on cooling, while if due to glue it will further coalesce and settle out in dense particles which remain intact on cooling. Levi[3] recommends the biuret test, and a modified Nessler's reagent has also been used for the detection of glue. But apparently the most satisfactory test available is the reaction with ammonium molybdate.

Ammonium Molybdate Methods

The ammonium molybdate method is given in the Paper Testing Methods referred to above, but does not appear to have gained much popularity, possibly because of failure to emphasize certain simple but necessary precautions. The precipitate formed by adding ammonium molybdate to a solution of glue is partially or wholly soluble in strongly acid solution. Hence the usual ammonium molybdate solution used for the detection of phosphate is unsuited to the detection of glue. Nor will the precipitate occur in neutral or alkaline solution. The reaction occurs to advantage only in dilute acid solution. It might be supposed that this condition would tend to make the method troublesome. But such is not at all the case, for the aqueous extract of paper is never far from neutral, making possible a uniform qualitative procedure.

Applying the Method

In applying this method it is well to work with definite amounts of material. In this manner a rough quantitative estimation of animal size is possible after some experience. Half a gram of paper boiled with 10 cc. of water gives good results. The aqueous extract should be cooled and filtered before adding the ammonium molybdate reagent. The reagent recommended by Schmidt[4] is prepared by dissolving 3 g. of ammonium molybdate in 250 cc. of water and then adding 25 cc. of nitric acid of specific gravity 1.2 (about one part concentrated acid to three parts water). The reagent is not permanent but on standing for some time will gradually settle out. About one volume of the reagent is added to two volumes of the cold aqueous extract, a white voluminous precipitate indicating glue. The test is very delicate, revealing minute traces of glue, so that if no precipitate results, or even in case of slight turbidity, one can be reasonably certain that the paper has not been tub-sized with glue.

Schmidt's Investigation

Schmidt[4] investigated the action of ammonium molybdate upon a large number of substances, including starches, and it can be inferred from his results that none of the substances other than animal size which might be present in the aqueous extract of paper would precipitate with this reagent. He found this test more sensitive than either the tannic acid or the biuret test. Several cases have come under observation in this laboratory in which the aqueous extract of paper gave a precipitate with tannis acid but after hydrolyzing the starch present no precipitate occurred with tannic acid. In every case the ammonium molybdate test for glue was also negative. Tests were also made using solution of glue and starch and various mixtures. The ammonium molybdate reagent always revealed glue when present without interference by the starch.

In conclusion it may be stated that tests and observations indicate that the ammonium molybdate method as described, possibly supplemented by Griffin's extension of the tannic acid method, will determine positively whether or not paper has been animal glue tub-sized.

Electrical Maintenance in Paper and Pulp Mills

By H. L. HAYES*

MAINTENANCE is generally distinguished from ordinary repair work in that it includes the inspection of equipment and the making of minor repairs when work can be done with least loss of production, and it also takes into consideration prolonging the life of equipment which may otherwise be shortened by premature breakdowns. Several years ago a steam engineer stated that he had obtained a good position because, in his previous position, he had been fortunate enough to have had a large number of breakdowns and, due to this experience, had become particularly expert in making repairs. Stress was laid on the fact that the only way to learn about apparatus is to get it running after a breakdown. With the best of maintenance programs there will still be plenty of opportunities to get breakdown experience, but a good maintenance crew will avoid many times the making of extensive repairs.

Maintenance work can be carried to extremes, thereby being unduly expensive and yet not accomplish the desired results. To obtain a proper balance of values, maintenance work should be systematic.

Keeping of Records

The first requirement of systematic maintenance is the keeping of records. Some men, especially in the smaller mills, may be inclined to scoff at records as being unnecessary and only so much red tape, but there is reason to believe that all mills need practically the same information and should keep the same records, with possibly minor changes to suit local conditions. In the larger mills it may take all of the time of one or even several men, while in others it may only require part time of one man, but in all mills complete maintenance records should be kept.

This article deals with electrical equipment, especially motors and motor starters, but the idea can be applied to all apparatus.

Regardless of the kind of industry using them, motors have the same general characteristics, but as to the records there is a wide divergence in the information to keep and the manner of keeping it. Theer is generally a tendency to keep too much data on one form. On cards for motors, there is often kept not only the motor specifications, which are practically constant, but also variable data such as sizes of pulleys, fuses or overload settings, load readings, motor-starter rating, driven load, etc. All these variable data are subject to change every time a motor is moved to a new location with the result that a new card is necessary or the old one corrected. There should, therefore, be two cards for each piece of listed apparatus, one of which is called the "Specification" card and the other the "Maintenance and Service" card. The "Specification" card should contain the following data:

Data On Specification Card

1. Number as assigned by mill.
2. Where purchased with date and purchase price.
3. Where first installed, with date.
4. Complete name plate rating including manufacturer's name.
5. Efficiency, power factor and heating guarantees.
6. Winding data, such as coil specifications, connections, number of coils, coil throw, etc.
7. Mechanical data, such as bearings, oil gages, oil rings, shaft sizes, etc.
8. Miscellaneous data for brushes, collector rings, etc., and space for general remarks.

Separate specification cards can be kept for each individual piece of apparatus, but those for motor starters and general equipment cannot have quite the complete printed form that is possible for motors, because there is greater variety of individual parts. However, contacts, starting coils, overload coils and operating mechanism are common to all types and printed headings may be used, but there should also be a large space left for the listing of odd parts. It will be noted that the specification data are seldom subject to change and, therefore, should be kept by itself. Complete information about old apparatus is hard to obtain, and it is good policy when a repair part is ordered which has not been previously listed, to get the drawing or catalogue number from the invoice and put it on a specification card, as one object of this card is to have a convenient method of filing information for future reference. This usually requires considerable space, so cards or loose leaf sheets should be made large, some at least 12 by 14 inches.

Parts That Should Be Stocked

Good maintenance work requires that there should be stocked parts which are subject to wear or deterioration and are necessary for continued operation, but yet cannot be easily or quickly made in the local plant. Spare bearings are considered a necessity for important motors, but if ordered by motor numbers alone there would be considerable duplication as a slow speed motor of one size may take the same bearing as a high speed motor several times as large. There is the other condition where bearings are of the same general type and size but are not interchangeable due to different minor characteristics. It is therefore necessary to have specific information about each part which it is desired to stock. Spare windings and even spare motors are a necessity for continued operation but are difficult for many electrical departments to obtain. A spare winding is preferable to a spare motor when the latter is special or where there is only one of that particular type and speed, if, as it is frequently possible, that particular motor can be shut down for a time to be rewound, but could not remain down long enough to get a new winding from the factory. In such cases a spare winding requires less investment than a spare motor and may be nearly as effective, especially as many motors can be rewound in less than twenty-four hours. For other motors a spare winding is useless because there would not be time to wait for its installation and so spare motors must be provided. With belt drives spare motors are the cheaper proposition, because even if the spare is not of exact size and speed wanted it can generally be used, at least temporarily. It is with direct connected motors that special difficulty is encountered. In figuring out the need of either spare windings or spare motors, study each individual case; estimate the effect of a breakdown and then, if of sufficient importance, plan on having a spare motor or a (complete or part) spare winding as the case warrants. There is a sequence of operation, such that even a small breakdown may have disastrous consequences and the need of spare equipment is obvious if one is to secure the continuity of service so essential to a paper mill.

The efficiency and power factor guarantees listed in the specification form are important for making power tests of motors. From a depreciation point of view there is no economy in running underloaded motors because up to a certain temperature the insulation deteriorates practically as fast with low temperature as it does with high. Underloaded motors are a loss through increased investment, lower efficiency and lower power factor. Power measuring instruments are therefore necessary for a proper maintenance program. It frequently happens that a complete set of instruments can be paid for in a comparatively short time through detecting underloaded motors. For example, there may be a case where a 100 hp. motor is carrying a 75 hp. load and, when in need of a 100 hp. motor a 75 hp. motor can be purchased and the substitution made, thereby going a long way towards paying for the instruments. This is not an uncommon occurrence, because there is a tendency to play safe in recommending the motor sizes for machines.

Possibility of Going to Extremes

In these days of agitation for high efficiency there is, however, the possibility of going to extremes and sacrificing reliability for efficiency. Reliability of operation is of supreme importance because when a motor breaks down its efficiency is zero and even though its operating efficiency may be high it will be more than offset by a few breakdowns. With a constant load, motors may be loaded up to the safe operating temperature, but with variable load it is a more difficult matter. This may be illustrated by a pump taking a normal load of 75 hp., but for a few minutes at a time taking 100 hp. From a heating standpoint a 75 hp. motor would be sufficient, but the overload relays will have to be set at approximately 110 hp. to take care of the maximum load which is 47 percent overload for the 75 hp. motor. This is too wide a margin for single rated motors and the extra investment for a 100 hp. motor would be offset by a new winding if the 75 hp. motor burnt out due to lack of proper overload protection, to say nothing of the loss of production. In some cases there would be a loss in efficiency and lower power factor in using the larger motor, but it is also frequently possible that the larger motor may be more efficient at the part load than the smaller motor at full load. There can be no set rule for the proper application of motors as each case really involves individual study to get unit as well as overall plant efficiency. There is, however, one important principle in the selection of apparatus from a maintenance point of view, and that is to standardize as much as possible, all things considered, on one manufacturer's line. When buying machines with which motors are to be supplied, it is good practice to specify that motors shall be supplied of same manufacture as are in general use around the plant, as this eliminates the carrying of extra parts and spare equipment.

The success of a maintenance program depends greatly on the men who are doing the actual work. We have on each shift a man whose duty it is to make periodic trips around to all the motors. Originally their idea was apparently to make as many trips as possible, looking over motors for any evident trouble, but their responsibility ceased if motors were running satisfactorily at the time. This attitude has been changed as they are now responsible for things that might happen which are within their power to prevent, as we depend on protecting motors from possible injury rather than on the chance that a motorman will happen to be on the spot when trouble occurs.

Causes of Motor Burnouts

The three principal causes of motor burnouts are, actual breakdown due to defective insulation, bearings burning out permitting rotor to rub on stator, and overloads. A well constructed motor is inherently a reliable piece of apparatus and most of its troubles are due to outside causes and it is therefore evident that all conditions affecting a motor should be considered.

In many locations it is practically impossible to keep motor windings clean, but ordinary dry dust does not necessarily injure winding, except by plugging the air ducts thereby reducing motor capacity. Oil, water and acid are, however, particularly undesirable and every effort should be made to

"Power in the Paper and Pulp Mill"

His eminence in the engineering profession, his vast experience as Consulting Engineer in paper mills, his broad knowledge of the entire power question will enable PAPER to present an incomparable service to its readers and to the paper industry. . . . .

prevent them from getting on windings. Oil is watched not only as to its coming from motor bearings, but it is liable to be thrown into the motor from belts, chains or gears. Pipes near motors must be watched for leaks; even if they are not where water or acid may directly strike the motor, they can do harm by the liquid striking the floor and spattering into it. Keeping motor windings in proper condition eliminates to a great extent this first source of trouble. Ordinary blowing out with compressed air is not sufficient, so besides cleaning, they should be painted with a good insulating varnish. Under ordinary service conditions motors should be completely taken apart at least every three to five years and if conditions are severe the interval should even be shortened to once a year. Some motors are difficult and expensive to disassemble, especially if in constant service, so when frequent painting is necessary the ends of coils can be painted using an air-gun at 20 to 25 lb. pressure. This gives quite effective results and the complete overhauling can be done at longer intervals. In paper mills there is always the danger of a motor getting flooded with stock or water and the painting of windings, by filling up pores and minute cracks in insulation, often prevents breakdowns from these causes. The air-gun is particularly useful because it enables the varnish to be sprayed between coils, and the whole exposed surface coated over.

Avoiding Bearing Troubles

Bearing troubles due to their own conditions are infrequent if kept properly filled with oil and free from grit, but may be caused by tight belts or crowding of shafting, and pump rotors. It is expected that whenever millwrights take up a belt, connected to a motor, the motormen will be notified so that they can watch the bearings for any undue heating. Bearing oil should be changed at definite intervals, at least once a year.

Overloads generally come from outside causes except when the motor runs single phase due to defective circuit connections. Proper overload protection will take care of overloaded conditions, and motormen are expected to check the operation of the overload relays frequently. There is a tendency when a motor is overloaded and blows fuses or frequently trips overload relays "to set 'em up higher" and take a chance, but this should only be done in emergency or under special conditions which warrant taking the chance, otherwise install a proper sized motor.

Motormen act as inspectors and do minor emergency repair work, but the greater part of the repair and inside inspection work is done by a regular repair crew. Whenever there is more than a one man crew, it pays to have certain work followed as much as possible by certain men who, by continued practice, will gain extra proficiency in their particular line. Inspection and repair work require men who can see beyond just the obvious things.

Chart System of Motor Inspection

Before we had systematic inspection motor starters gave trouble and were a source of annoyance and expense, especially if it occurred during the night shifts and had to be fixed by the motormen. Their work would be more or less hurried and not done well so that starters would frequently again give trouble, we therefore had the vicious circle of a trouble hurriedly fixed causing more trouble. To overcome this a chart or card system of motor and starter inspection was developed. Every other week was assigned for Motor Starter Inspections and certain men detailed to do this work. In deciding how often inspection was needed it was assumed that a starter, under ordinary service, should stand up at least for one year when started twice a day for 300 days or 600 times. With this as a basis it was estimated how many times each starter was expected to operate, and that number of times divided by the 600 is the number of times a year the starter is to be inspected. This is used only as a basis and is not strictly followed because some motors are only started once a week, which would be 52 times a year, but it was considered that any starter could afford at least one inspection a year. On the other hand, there are motors started a large number of times, even to 300 or 400 times a day. These gave considerable trouble when ordinary hand starters but with the magnetic switch type have given practically none. There seems to be a growing tendency to use magnetic or remote control starters and eventually they will be nearly universally used, as they eliminate to a great extent the personal element in starting, as improperly started motors are a considerable source of trouble. Acid plants, blow pit rooms and such places offer an opportunity to put magnetic types of starters in a room by themselves out of reach of acid fumes, dust, etc. Our principal trouble with the magnetic type of starter has been when someone "takes a swipe" at the push button with a pickaroon instead of using the hand to start and stop a motor.

Forms for Inspectors to Follow

Inspections include not only the contacts but the complete equipment, and in making inspections we have found it advisable to have forms for the inspector to follow. These eliminate any tendency to slight certain parts as it is required to check each part as being O. K. or otherwise.

It not only aids the inspector but after the desired information has been noted in the service record, inspection forms are sent to the motormen who are not very keen on having an inspector report things that they have overlooked.

On alternate weeks the general apparatus around the plant is inspected, such as station apparatus, transformers, etc. Previous to scheduling the inspection work it was customary to bring a large crew in each Sunday and the work was more or less haphazard. Some apparatus got too much attention and others were neglected altogether.

The service records show the results of inspections and overhauling. If it is found that between inspections apparatus gives trouble, their frequency is increased and vice-versa if generally found to be satisfactory. The keeping of minor records as fuses blowing and overloading relays tripping has enabled single phase running to be detected, as well as faults in the machines driven. When available we put down the name of the man who started the motor if it gives trouble by blowing fuses due to improper starting, especially as may happen in "jogging" to run on belts, etc. Continued trouble along that line enables us either to caution the man or to instruct him in the proper manner of handling starters. It is not uncommon to find men with the idea that they are helping a strater by operating it slowly.

When a motor is purchased the service record starts with a number and rating. When installed, the date, location and machine driven is recorded; ampere and voltage readings are taken, also air gap, pulley size, belt data and overload protection setting. Routine cleaning is not recorded but all inspections, overload tripping, and overhaulings are noted. It sometimes happens that when installed certain overload settings are made and later inspection reports show them changed. The service record is a check on what the original setting was so that there cannot be changes of adjustment without being detected. Service data is never destroyed because if a motor is changed to a new location a note is made to that effect and the record continued. It is not a difficult or time consuming record to keep because many motors give practically no trouble and only two or three entries may be made during a year's time.

Keeping the Work from Becoming Congested

We have found it a decided advantage to schedule inspection as it tends to keep the work from becoming congested. We have also found it an advantage to furnish simple written instructions on the care of apparatus. Many men find it difficult to apply themselves to a regular course of study, but will read instruction sheets and bulletins supplied by the local plant or by the apparatus manufacturers, as apparently they wish to get to the point quickly about apparatus in which they are interested.

Paper Mills with electric motor driven grinders, electric steam boilers and electric motor paper machine drives are fast becoming entirely dependent on electric power for their operation. One can read articles here and there about electrical maintenance work, but practice semes to vary so much, that, considering its importance, it would seem to be within the province of this Association to obtain data to more or less standardize record forms, and give recommendations as to proper upkeep of equipment.

Causes of Deterioration of Color in Pulp and Paper

By MARTIN L. GRIFFIN*

AT the last general meeting of the Technical Association C. S. Hamm presented a paper dealing with the deterioration of the color of soda pulp. In my brief discussion I wish to broaden the scope of the inquiry to include paper stock generally and bleached cotton textiles.

It is a matter of common knowledge that all wood pulps and papers made from them discolor on aging much faster than rag half-tuff and rag papers. Papers composed largely of groundwood discolor on a few hours' exposure to sunlight. Groundwood contains no mineral chemical substances other than those composing the ash. We cannot therefore attribute discoloration of groundwood to any chemical treatment leaving residues behind.

Chemists familiar with the soda process know that the pulp, as it exists in the digester before blowing, is very light colored and acquires the dark color almost instantaneously when exposed to the air.

Important Fact in Making Pulp

Plant growth generally produces cellulose and the products of lignification called lignocellulose. All processes dealing with a separation of these two constituents for high grade products regard the lignifying substances as impurities. These are more reactive and sensitive to chemical change. Upon this fact depends all the commercial processes for making pulp and bleaching textiles. Perhaps we should not say that the natural impurities of cotton are the products of lignification, but for this discussion we may consider them in the same class.

Harsh and excessive treatment of cotton will tend to degrade it and make it more reactive to natural influences resulting in an inclination to discoloration. When carefully bleached (cleansed) it will not react

The economic problem of securing an adequate supply of paper

THE book is of special interest to everyone connected with the pulp and paper industry and equally so to all users of print paper. It points out clearly what must be done to develop sufficiently our supply of pulpwoods. It shows the steps necessary in forest conservation and discusses the subject from the practical viewpoint of industrial needs.

Pulpwood and Wood Pulp in North America

By ROYAL S. KELLOGG

Author of *Lumber and Its Uses, The Cost of Growing Timber, The Timber Supply of the United States,* etc.

270 pages, 6x9, 87 illustrations, $4.00 (*English price 20s.*) *net, postpaid*

The book describes the pulpwood industry, the processes of making paper pulp from wood, the timber supply of North America, the need for increased timber production and the future possibilities of the pulp and paper industry. Detailed statistics of production and consumption since the establishment of the industry are given in the appendix and shown in the text by means of graphic charts of unusual effectiveness. The book also carries many illustrations typical of mill operations and forest scenes.

Do You Know

That 100 million cords of pulpwood have gone into paper in the United States and 30 million cords in Canada?

That paper-making is a billion-and-a-half-dollar industry in North America?

That a permanently self-contained operation for the manufacture of 100 tons of news print paper daily may require the equivalent of an investment of $10,000,000?

That the United States and Canada produce and use as much paper as all the rest of the world combined?

That the per capita consumption of paper in the United States is 150 lb. yearly?

How much pulp may be made from a cord of wood?

How much pulpwood and wood pulp has been exported from Canada?

How much pulpwood and wood pulp has been imported into the United States?

What are the pulping properties of 70 species of American woods?

What are Forest Regions of North America?

How much and what kinds of timber there are yet left in the various regions of the United States and Canada?

How much forest land in North America is publicly owned and how much privately?

What regulations apply to timber cutting in the public forests?

What are the essentials of a forest "Working Plan"?

That forestry is the application of definite scientific principles to the growing and using of timber crops?

What it costs to grow timber?

Who is responsible for the maintenance of the timber supply of the United States and Canada?

What are the essentials of a National Forestry policy?

That without forestry there is no adequate, permanent supply of paper and other wood products in America?

That there is no sense in delaying the effort to maintain the American timber supply on the false assumption that we can turn to any other part of the world for any considerable part of the wood products essential to our well being?

with iodine, but with harsh and prolonged treatment it tends to break down and will react blue and even purple with this reagent. Cotton is the purest form of cellulose known, and yet it requires a very thorough treatment to free it from every vestige of impurities if cotton cloth is to remain white on the shelves of the retail dry-goods dealer.

Cotton duck for white shoes with rubber soles must stand an even severer test. Various form of aniline are used as accelerators in the vulcanizing processes, and if there are even traces of furfural-bearing impurities remaining in the cloth it will discolor.

Varying Proportions of Cellulose

Different woods contain varying proportions of cellulose and lignocellulose which necessitates a selective treatment. Those containing larger amounts of lignifying tissues and intercellular substances, such as tannin and resins, will be the most difficult to free from residual impurities. This is a matter of common experience. Northern white poplar will yield a pulp which will discolor less easily than the southern variety. Straws furnish a blend of cellulose and lignocellulose which will make a quality of paper difficult to match. In England and Scotland esparto has been used for a great many years for making high grade book and envelope paper, but I have never seen a piece of paper made from esparto which would not age to a pinkish tint in a short while in an atmosphere containing traces of aniline fume, which is a test for furfural-yielding substances and a warning that they will discolor with age. The test we apply to white cotton fabrics to determine if they are "well bottomed" or bleached, is to subject cuttings to an atmosphere of steam under a little pressure for about two hours. If they contain residual impurities they will discolor appreciably.

In textile finishing where scouring processes with detergents are employed, as in degumming silk, we know that to free the goods from the last traces of soap residues we must use a little soda ash in the finishing rinsing. This is because weak solutions of soap hydrolize, leaving a film deposit of fat or oil as the case may be, deposited on the cloth.

Thus, then, it will be doubly difficult to remove the last traces of impurities from pulp cooked by the alkaline processes, because the black liquors will contain crude resinous soaps, and in the washing process when the washings become dilute they hydrolize and fix filmy resinous residues on the fiber, which results in discoloration by oxidation. It is well known that even the rosin from engine sizing is a menace to permanent white in high grade papers. It is true that slow drying of pulp and paper will cause impurities to migrate, by capillary attraction, to the surface exposed, but this it not the answer here, because with rapid machine drying, impurities have no time to migrate.

Cross and Bevan's Views

The whole subject is dealt with very tersely yet fully in a report of a committee of the Society of Arts in 1898, on the "Deterioration of Paper" and contained in Cross & Bevan's book "Researches on Cellulose," from which I quote:

"The report first discusses the two directions of depreciation in use: (1) Actual disintegration shown by loss of resistance to fracture by simple strain, and by loss of elasticity—that is, increase of brittleness; (2) Discoloration. These are independent effects, but often concurrent. They are the result of chemical change of the cellulose basis of the paper, brought about by acids or oxidants used in the process of manufacture, and not completely removed from the pulp, or by acid products of bleaching—as oxycelluloses or chlorinated derivatives; again, by the starch used as a sizing agent, or by oxidations induced by rosin constituents when the rosin is used in excess. Discoloration is an attendant phenomenon of these changes, but is more frequently due to the low grade celluloses (esparto and straw) and lignocelluloses (mechanical wood pulp)."

Thus we come to appreciate the causes for discoloration in pulps and papers. The most permanent white may be expected from those raw materials which are purest in nature and are treated by very gentle processes. By as much as papermaking raw materials contain adventitious substances other than normal celluloses, by so much is our problem to make an enduring white paper involved, and to make products as good as they can be or are expected to be, will require great skill and care in the processes.

Report of Committee on Abstracts and Bibliography

By C. J. WEST

Chairman

THE Chairman of the Committee regrets that he must again report that the work of the combined Committee on Abstracts and Bibliography has been confined almost entirely to routine matters during the year 1923. Much of the time of the Chairman has been occupied in the completion of the translation of Heuser's text-book on Cellulose Chemistry (which has been prepared with the aid of Dr. G. J. Esselen, Jr., Chairman of the Cellulose Section of the American Chemical Society), and also in the preparation of a bibliography of bibliographies on chemistry and chemical technology, a compilation which will include about 7,500 references to bibliographies, and which, it is hoped, will be of some interest to the paper industry, inasmuch as it contains, among other things, references to practically all of the bibliographies on papermaking.

Abstracts

Through the able assistance of the abstractors for the Technical Section (John L. Parsons, A. Papineau-Couture, M. L. Caust and Paul Bartholow) it is felt that the literature of the papermaking industry has been thoroughly covered, and that abstracts of value have been supplied to the industry. The Chairman has endeavored to classify these abstracts in such a way as to make them accessible, and believes that their value has been further increased by the preparation of a semi-annual index of the Technical Section. During the year 1923, the published abstracts totalled 76,178 words, which corresponds to approximately 900 inches, or about 45 printed pages. The Chairman desires to emphasize that the credit for this work should be given entirely to the abstractors.

Bibliographies

During the year, 1923, five bibliographies were published, as follows:

No. 37. American and Foreign Paper Trade Periodicals. Frederick C. Clark and Clarence J. West. *Paper Trade Journal,* 76, No. 4, 45-49 (Jan. 25, 1923). A revision of contribution No. 3.

No. 38. Paper research literature, VII. Revised. A list of contributions by members of the Bureau of Standards, Department of Commerce, 1910 to Dec. 31, 1922. F. A. Curtis and C. J. West. A revision of Contribution No. 18. *Paper Trade Journal,* 76, No. 6, 47-52 (Feb. 8, 1923).

No. 39. Electricity in Pulp and Paper Mills. A reading list. Clarence J. West. *Paper Trade Journal,* 76, No. 8, 5053 (Feb. 22, 1923).

No. 40. Bibliography of Papermaking for 1922. Clarence J. West and A. Papineau-Couture, *Paper Trade Journal,* 76, No. 16 to 26 (1923).

Paper Research Literature

No. 41. Paper Research Literature. I. Contributions by Members of the Forest Products Laboratory. *Paper Trade Journal,* 77, 46-50 (Aug. 16, 1923).

In addition to these bibliographs, a bibliography on beating appeared in connection with that section of Volume IV of the textbooks.

Complete Bibliography

The Chairman has continued in a small way his efforts to prepare a complete bibliography of papermaking. All of the references from Chemical Abstracts have been carded, as well as those from the *Journal of the Society of Chemical Industry.* It is hoped during the coming year that much of the work on this project can be completed. This will involve a page by page search of the papermaking magazines. It is felt that this search need not cover those periodicals issued before 1900, because most of the important work has appeared since that time.

Requests

The usual number of requests for bibliographies, photostatic copies of printed material, and loans of current magazines have been received by the chairman. In most cases, the information has been furnished, although in a few cases answers could not be supplied. It is to be hoped that this phase of the committee's work may increase in volume, because it is the best indication of the value of the committee's activities to the industry in general.

Definitions of Paper Terms

Your chairman has also served as chairman of the sub-committee on Definitions of the General Committee on Standardization of Paper Sizes of the Bureau of Standards, and with the able assistance of F. A. Curtis, prepared and published some definitions of some eight hundred paper terms. While it is realized that these definitions are preliminary in nature, they at least furnish a basis for discussion and constructive criticism.

Disposal of Lime Sludge and Sulphate Pulp Mills

By G. K. SPENCE*

FOR some years past soda and sulphate pulp manufacturers have been confronted with the problem of disposal of lime sludge from the causticizing process. When compelled to discontinue dumping the lime sludge into the streams many were forced to take hurried steps to dispose of it. The first step was to pump the sludge to large sedimentation basins, which were open fields banked up on all sides, in which the lime was permitted to settle and the clear solution from the top passed to the stream. This was an expensive means of disposal, especially where ground was scarce, as one can readily understand how soon these basins would fill up and necessitate raising the walls or increasing the area of ground covered.

With the advent of filter presses for washing the soda from the sludges, and thus increase the capacity of the alkali-room, and decrease the loss of soda, the pulp manufacturer was attracted to other methods for disposing of the lime sludge.

The lime cake from the filter press contains from 40 to 50 per cent water, and the most natural conclusion is that it is in proper condition to be readily dried and marketed for agricultural purposes. A number of manufacturers installed rotary driers, using coke as fuel, dried this lime, put it up in bags and marketed it under the name of precipitated or agricultural lime. The market for agricultural lime is seasonal and there are times when it is impossible to dispose of it, and the manufacturer is compelled to revert to his old method of disposal.

Even when the market will absorb the agricultural lime it is about a break-even proposition and if it is necessary to store any, it is always rehandled at a loss.

Knowing that whiting would bring a higher price than agricultural lime some manufacturers made the necessary installation to produce this commodity from reclaimed lime sludge. As the trade requires a very clean product, free from caustic alkali, and of an extremely fine state of subdivision, it requires an elaborate installation to produce material which will meet the requirements.

Lime sludge from the causticizing operation contains about 8 percent unspent lime or calcium hydrate and it is necessary to carbonate this which was usually done in CO_2 towers, and even then it was a difficult matter to keep the caustic alkalinity under 5 per cent.

The lime after passing through the driers was ground and bolted or air-floated in order to bring it to the required state of subdivision. There is only a differential of about $4 per ton between the selling price of agricultural lime and whiting, which difference is mostly absorbed by the over-head on extra installation, extra labor, etc., necessary to prepare the material to meet the requirements of the trade.

The whiting market is also very uncertain and as in the case of agricultural lime, the manufacturer is compelled at times to resort to the sedimentation method of disposal or if allowable, pass the sludge to the stream, until the market is again ready to absorb the whiting.

When confronted with the problem of finding a steady market for disposal of agricultural lime or whiting, the manufacturer was compelled to investigate the practicability of reburning the lime sludge and using the reclaimed caustic lime to causticize soda in his own process. Those who have studied this problem are unanimous in their conclusion that reburning is the most feasible method of disposal. By this installation the manufacturer can realize a greater return on his investment and at the same time furnish his own stable market for disposal of the reburned lime, which he uses right over again in his own operating system. In fact this method of disposal. By this installation the to the pulp manufacturers that, regardless of the large amount of money invested in agricultural lime and whiting plants, almost every one has been junked, and conversion made into installations for reburning lime.

The writer has had experience with all three systems and in order to familiarize those interested in lime sludge disposal with steps taken a rough outline of each is here given:

Agricultural Lime

No extra care is necessary in preparing the lime sludge before passing same to the agitated receiving tank for the filter press. Either the continuous or batch type filter press may be used when washing the lime sludge, but care should be exercised to see that the soda is well washed from the cake before discharging it from the press. This can be better controlled by use of the batch filter.

The cake discharged from the press is passed through a rotary dryer 32 feet long by 4½ feet in diameter, the heat being furnished by burning coke, producer gas, or natural gas in the fire box. The dried lime is discharged into a larger dust chamber at the back of the rotary dryer, and carried by a screw conveyor to the bucket elevator, by means, of which it is discharged into the hopper supplying the bagging machine. Draught on the rotary drier is induced by means of a fan, and the air containing some fine dust is forced through a dry dust-collector, and thence through a stack provided with sprays to prevent fine dust from passing to the atmosphere. In some mills a special dust collecting device, such as the Dracco, Clark or Sly is installed. An Urschel-Bates valve bag packer is usually employed to pack the material for market. Following is a rough estimate of the installation cost, and daily operating cost of a plant for the manufacture of 50 tons of agricultural lime per day.

Installation cost, $65,000.	Daily operating cost
Interest and depreciation, 15% (325 days)	$30
Fuel for drying (coke)	70
Power	17
Labor	80
Valve bags	100
Repairs and office	25
	$322

Production cost per ton $6.44.

Agricultural lime will sell for about $7.50 per ton f.o.b. mill, but as it is necessary to pay 50c to $1.00 per ton to a fertilizer company for marketing the lime the margin of profit is very small, provided the market would absorb the lime as fast as it is manufactured, but as it is seasonal and unsteady at all times, it requires more or less storage and rehandling means a loss.

Whiting

In order to prepare the sludges for whiting it is necessary to remove all traces of black ash, and to carbonate all of the caustic lime before sending it to the filter press. The caustic alkalinity is usually removed by passing the sludge through CO_2 towers, the CO_2 being produced by burning limestone.

When manufacturing whiting it is next to impossible to obtain satisfactory results by use of continuous filters. The composition of the whiting must be controlled so closely that in order to procure the desired results it is advisable to use batch filters. Care must be exercised in passing the pressed cake to the rotary driers, as the feed must be uniform in order to insure proper drying results. It is a more expensive operation to dry whiting than agricultural lime. It must be dried either with indirect heat or natural gas. Any other means of drying tends to darken the finished product. The temperature must also be controlled very closely in order to completely dry and at the same time prevent burning some of the product to the oxide.

The equipment for inducing the draught and removal of dust from the escaping gases is practically the same as when manufacturing agricultural lime.

After passing the rotary drier it is necessary to grind the whiting and bolt it through a 200 mesh cloth, or grind and airfloat it in order to bring the product to the desired state of subdivision. This requires extra equipment and labor. It is necessary to have two forms of packers in order to comply with trade requirements; one being the open mouth bag packer for cloth bags, and the other the Urschel-Bates valve bag packer for paper bags.

Following is a rough estimate of installation cost and daily operating cost when manufacturing 50 tons of whiting per day.

Installation cost, $120,000.	Daily operating cost
Interest and depreciation, 15% (325 days).	$56
Fuel for drying (natural gas)	100
Power	30
Labor	135
Valve bags	100
Repairs and office	35
	$456

Production cost per ton $9.12.

The selling price of whiting varies from $11.50 to $12.00 per ton f.o.b. mill, but as it is necessary to pay a commission of 10 per cent for marketing the commodity, the manufacturer receives about $10.50 per ton for whiting when the market will absorb it as fast as it is produced. This will leave a profit of a little less than $1.50 per ton, if it is not necessary to re-handle the whiting; but if it is necessary to haul it to a warehouse, store and rehandle it when the market will absorb it, the necessary expense of rehandling will almost balance the margin of profit.

A lime reburning plant using producer gas for heat supply, is a slightly more expensive installation, but the return on the investment is so much more satisfactory, that it requires very little investigation to decide in favor of this equipment.

There is no previous treatment of the sludge necessary, it being pumped direct from the alkali room to the supply tank for the press. A continuous filter should be used, as it requires less attention and uniformly washed material is not essential.

The cake from the filter is discharged into the rotary furnace, which is from 100 to 120 feet in length and 7 feet in diameter, lined with fire brick. Producer gas is burned in the fire box.

In this process the burned lime is discharged at the fire box end of the rotary, while in the other two processes the dried lime is discharged at the opposite end.

The burned lime is either discharged into cars and hauled by hand to the alkali room, or conveyed to a causticizing tank in the lime burning room, where the carbonate liquor is causticized and pumped to settling tanks in the alkali room.

Following is a rough estimate of installation cost and daily operating cost of a plant for reburning 35 tons of lime per day:

Cost of installation, $130,000.	Daily perating cost
Interest and depreciation, 15% (325 days)	$60.00
Coal for gas producer	87.50
Power	22.00
Labor	50.00
Repairs and office	15.00
	$234.50

FITCHBURG DUCK MILLS

ESTABLISHED 1844

FITCHBURG MASS.

Reclaiming cost per ton $6.70.

This estimate is based on coal at $5 per ton at the plant, and burning two tons of lime per ton of coal. With this installation it is possible to reclaim 85 to 90 percent of the lime used.

Powdered coal has been tried for furnishing the heat required for reburning the lime, and while this method will increase the burning efficiency, there is not the necessary data at hand to determine whether the accumulation of dirt in the lime from the ash in the coal is of sufficient detriment to condemn its use.

A pulp manufacturer, who is paying more than $8 per ton for his lime at the mill, and not over $5 per ton for coal, will show a nice profit from an installation for reburning lime for his own use, and at the same time discontinue the practice of discharging the lime sludge into the stream.

A Measure of the Color Characteristics of White Papers

By **R. E. LOFTON***

PAPER, or other material, is said to be white if it reflects light nearly or quite non-selectively and also reflects a large proportion of the light falling upon it. It is common experience, however, that there is a wide variation in the tints of so-called white paper. The Bureau of Standards has measured the departure from true white of 21 commercial papers, including newsprint, printing, book, writing, bond and ledger.

Attempt was at first made to measure the departure from true white of each paper by using a single reflection of white light from the paper, as is done in grading or matching papers for color by the unaided eye; but this method was soon abandoned because the departure of the color of the paper from true white was usually less than the error made in setting the scale on the colorimeter.

A colorimeter constructed on the principles formulated by A. H. Pfund, which makes use of more than three reflections from the paper, was then tried. It is obvious that the color characteristics of a paper will be much more apparent upon the examination of a ray of light reflected three times from its surface than if the ray has been reflected but once. This colorimeter facilitates the comparison of two beams of light having a common source, one beam having been reflected between three and four times from the surface of the paper, and the other beam coming from the source unchanged. The two beams will appear exactly alike when viewed in the divided field of a photometer if there has been no change in the beam of light reflected by the paper.

In practice, the paper is tested for its brightness, or reflecting power, for three colors, or wave lengths, of light: red (625 m. wave-length), green (550 m. wave-length), and blue (460 m. wave-length). This is done by inserting consecutively into the ocular tube of the photometer three light filters having the dominant transmission as given above and matching the two beams of light for brightness for each color. A graph of the color characteristics of the paper may then be made, using its brightness for the three colors to form the vertical axis and the given colors or wave-lengths to form the horizontal axis.

Of the 21 papers tested, it was found that all were more or less deficient in the proportion of blue light reflected, and also that all were deficient, but to a smaller degree, in the proportion of green light reflected.

The 21 papers were also matched for color by unaided eye observation by 17 individuals experienced in color work. There was practically no agreement, however, among the 17 individuals as to the "whiteness" of the various papers. The accuracy of this colorimeter is from two to five times that of the unaided eye, as shown during this investigation.

It may be stated, in conclusion, that practically all, and perhaps absolutely all, commercial white papers depart from true white, in that they do not reflect all the components of white light in the same ratio, reflecting less blue light than green, and less green than red.

---

Committee on Coated and Processed Papers

By **EDWIN SUTERMEISTER**
Chairman

AT the meeting in April, 1923, it was decided that the work of the Committee on Coated and Processed Papers for the following year should include the two lines, Waxed Papers and Gummed Papers. It was thought that the work could be carried out best by organizing two sub-committees, and Raymond Hatch was asked to serve as chairman of the sub-committee on waxed papers, and Norman Clark of that on gummed papers.

Mr. Hatch made very careful inquiry among the manufacturers who were prominent in the waxed paper trade and found it impossible to persuade them to enter into questions of investigation or research in a co-operative way. He felt that any work done by the committee under such conditions would be done by one man and that the work would be accepted by all the rest of the industry without any reciprocal information. After considering the situation carefully it was thought best to abandon, temporarily at least, the attempt to carry on work along this line. This sub-committee was therefore allowed to die a natural death.

Mr. Clark appointed on his sub-committee George W. Sullivan of the Nashua Gummed and Coated Paper Company and George G. Richter of the Brown Company. Through a misunderstanding, Doctor Richter has done no work for this committee nor taken any part in the carrying out of its program. Mr. Sullivan has prepared a paper on the effect of acetic acid on animal glue, and this paper will be read and discussed later.

Although not on Mr. Clark's committee J. O. Ross has ably seconded its efforts by preparing a paper on the drying of gummed papers. This will also be read and discussed at the sectional meeting.

During the year the question of a possible substitute for casein was brought up by a member of the Technical Association. This has aroused considerable interest in the industry and it has been attempted through correspondence to find out who was interested to the extent of supporting the necessary investigations financially. No definite plans have yet been made and opinion seems to be divided as to whether the work should be done by the Bureau of Standards, in which case the results would be free for all to use, or whether it would be better to have it done in a private laboratory so that the results would benefit only those who finance the undertaking.

Chapter in Textbooks

The most important work carried out by the committee this year has been the preparation of the manuscript on Coated Papers for the textbooks. This work has been done almost entirely by Norman Clark.

Substitute for Casein

For the coming year it would seem well to organize for the investigation of possible casein substitutes and push the work along as fast as possible, for at best it will probably be a rather long investigation. It is hoped that more work relating to gummed papers can be undertaken as this should be a fruitful field for research. Another subject which is proposed is the manufacture and use of satin white. It would probably be quite difficult to obtain co-operation in this work for it is a field where there are supposed to be many secrets, but as there is practically nothing, about it in the technical literature there is a good chance to fill a distinct want.

Report of Materials Testing Committee

By **HELEN U. KIELY**
Chairman

DURING the past year the Materials Testing Committee has assembled and had published for the first time standard methods covering the more common materials tested in the ordinary paper laboratory.

These methods are in all instances the practical commercial methods and are in daily use in many laboratories. While it is realized that these might not meet with the approval of the highly scientific, it was thought better to prepare such methods as would best suit the needs of the ordinary paper mill chemist. For college laboratories or for referee analysis a more detailed method might be more advisable.

This edition of the Materials Testing Methods is in no way complete or final. It is the hope of the Committee that from this first attempt many valuable criticsms and suggestions will be forthcoming and a more complete and improved edition printed.

The Committee will continue to assemble and check new methods during the year. It is hoped that a revised method for pulp testing may be developed, as there seems to be a growing need for a new method that may better approximate mill working conditions.

No data seems to be available on the testing of rags and it is also hoped that something may be worked up along this line.

If there are any particular methods which the members desire the committee to investigate they should be brought to the attention of the committee and consideration will be given them.

Comparative Efficiency of Pulp Grinders

W. A. MUNRO*

CONSIDERABLE discussion has taken place during some few years past concerning the relative merits of the new Voith magazine type grinder and the older or pocket type. These discussions have created considerable interest in grinders and each type has its ardent supporters and satisfied users who are not backward in pushing forth the claims of their favored type. The Groundwood Committee for the past year has been endeavoring to secure as much data as it possibly could concerning the different types and their performance, and has been able to obtain a considerable body of valuable information on such points as hp. per ton, labor cost per ton, tons per stone per unit time, etc. This information we have tabulated and classified so that the salient features can be recognized at once. We have also secured samples of paper made from each type of grinder as we feel that the fact that one mill may use 60 hp. per ton with a certain type of grinder should not be used as an argument for or against that grinder or a basis of comparison with another type unless the running conditions in the mill, such as speed, per cent of sulphite, etc., and the quality of the finished product are taken into consideration with the horsepower figure.

Little Difference in Quality of Paper

We have found that there is but little difference in the quality of paper made of pulp from different types of grinders. We have found as great or a greater difference in the paper made by two different mills both using pocket grinders as we have in the paper made by two other mills, one using pocket grinders and the other using magazine grinders.

If freeness testing had gone ahead to such an extent that it would be possible to standardize groundwood, the matter of comparison would then be much simpler, but with the freeness tester of such value that it can be used only in one mill or a small group of mills where white water conditions are about the same, another basis of values must be taken.

The committee has been in touch with practically every large newsprint mill in the United States and Canada. We have selected twelve representative mills and tabulated the returns from them. We have not listed the initial price of any of the equipment as the prices vary so according to the year of installation that they would be practically valueless. I might say that a magazine grinder at present would cost very nearly $1,000 per ton of pulp produced while a pocket grinder would cost but $300 per ton.

The magazine type of grinder makes a much better looking mill than the pocket type. There is an almost total absence of steam, the walls and floor are free from pulp spatterings, and all wood is handled on an upper floor.

Conclusion

The magazine grinder using 4 feet wood is much more economical in labor cost per ton over the three-pocket type of pocket grinder on 2 feet wood producing less than 7½ tons to a stone per 24 hour. The saving in labor over this 2-foot type is so much that it more than over-balances the increased stone cost of the magazine type and higher power cost per ton. This higher power cost is due to the fact that more power is required on the magazine type to grind a ton of pulp than in the pocket type.

The difference in costs is not so great and rapidly disappears as the size and production of the pocket grinder increases. With a production over 7½ tons to a stone and up to 10 tons there is but little difference in the labor cost, the higher labor cost of the pocket grinder being largely offset by greater initial cost, higher stone and power costs of the magazine type. Over 10 tons to a stone the larger type of pocket grinder is more economical in every way than the magazine type.

TABLE

Report of Sulphite Pulp Committee

By R. A. HAYWARD

Chairman

THE efforts of the committee have been divided into several lines, each member of the committee taking charge of one of the divisions.

Investigations have been made along the following lines:

1. Methods of testing the bleachability of pulp before charging the bleachers. This work has been carried on with an effort to determine the best method of testing the pulp so that it would be possible to add the proper amount of bleach for the charge.

2. The various means of effecting economies in the steam required for cooking.

3. An effort has been made to develop more accurate means of measuring the economy of acid plant operation. This work has been carried on with a view of making it possible to compare one plant with another in a more intelligent way.

4. Investigation has been carried on to determine the various ways and means of measuring wood into a sulphite mill.

5. R. N. Miller of the Forest Products Laboratory has been carrying forward his work on the Chemistry of the Sulphite Process.

Some of the members of the committee are ready to report on the work that they have been investigating, others have not completed their investigations and are not ready at this time to make a report or recommendations.

During the past year there have been some interesting developments in the sulphite process. Most of these developments have been based on an effort to increase the yield from the wood or with a view of effecting other economies in the process.

One of the plants in the middle west very recently started on a new process whereby they are cooking their pulp with a neutral sodium sulphite. This represents an interesting departure from the present method of cooking. It will be interesting to see how this process works out and it is hoped that a report can be made on it in another year.

A great deal of work has been done through the west on a patented process involving the use of reducing reagents, particularly zinc dust, in the sulphite digesters. By maintaining a strongly reducing condition in the digester it has been possible to carry a higher combined acid. The result of this work has indicated that a higher yield is obtained from the wood and a better quality of pulp is also produced. The unbleached pulp is brighter in color and requires less bleach to bring it to the standard color of bleached sulphite.

Some work has also been carried with another patented process which reclaims the heat and gas from the relief of the digesters. This was accomplished by relieving from one digester into another during the early stages of the cook. This has already been reported on through the Technical Section.

An investigation has been made of the various methods that are now being used for testing the strength of the sulphite pulp. Very few of the mills are using the exact method adopted by the Technical Association a few years ago. Most of the mills have found that a beating curve is of more value than the single point as recommended in the Standard Method: This beating curve is made up by beating the pulp in the ball mill and testing it after every 1,000 revolutions. This curve is of value in determining the characteristics of the pulp. Several of the mills are using a small beater for making these strength tests. A small beater has the advantage that the tests can be made more rapidly and the action of the beater more nearly approaches the conditions that exist in the paper mills. The use of the beater has the disadvantage that it is hard for one mill to check the tests of another mill on the same pulp.

During the coming year it will be desirable to revise the standard methods of testing in the sulphite mill and bring these methods up to date according to the practices that are now in use.

PAPER Industry

Exposition Exhibits Educational

Both the Public and the Manufacturers of Paper Learned Much at the Second Annual Paper Industries Exposition

WITH a variety of exhibits that ranged from vast suction rolls to tiny scales, the Second Paper Industries Exposition at the Grand Central Palace was an important adjunct of the annual convention of the American Paper and Pulp Association. Exhibits were both educational and commercial.

Machinery companies and mill supply companies had exhibits aimed chiefly at the paper manufacturers. The Southern Kraft Manufacturers, the American Association of Paper Specialty Manufacturers, and others, had exhibits that were wholly educational. Other companies displayed wares with the view of appealing direct to the public. And thus there was something for every one at the show.

By far the most engrossing exhibit at the exposition, as far as the public was concerned, was the papermaking by hand of Dard H. Hunter. His old time appliances, the methods he uses in the actual making of paper caused a crowd to be congregated at his place, at the booth of the Paper Makers' Chemical Company, throughout the week. Each step was gone through hundreds of times during the week, and hundreds of sheets of hand made paper was given out to the crowd. Mr. Hunter himself was forced to explain and explain to the interested people. Even men from paper mills had never seen the kind of apparatus with which Mr. Hunter worked. The huge wooden presses, the old vats and instruments, the hand dryers, all caused vast interest.

Paper Clothes

A colorful touch was lent to the exposition by the presence of Ada May, star of the musical comedy "Lollipop," which recently opened in a Broadway theatre. Ada May and a group of her dancing girls appeared in costumes made entirely of paper, of various tints. Afterwards the costumes were placed on display.

While the crowds attending the exposition were not as large as the exhibitors had hoped, there was, nevertheless, a large number of visitors both from the public and the visiting manufacturers. Many of the machinery companies reported at the end of the week that sales and prospective sales had been numerous, while towards the end of the week, the familiar "Sold" sign began to appear about the hall.

It is certain that the exposition made a much better showing than last year. It was held on the main floor of the Grand Central Palace, and consequently enabled the machinery men to display their wares to much better advantage. Some unusually large machines were in evidence and several were in actual operation. At times the rumble of the machinery made the hall sound like a factory.

Vast quantities of souvenirs were given away by the exhibitors. Some visitors with a penchant for collecting these souvenirs, went home laden down as if they had been on a Christmas shopping tour.

Throughout the six days of the exhibition there was a constant flow of people through the aisles, but by far the biggest day was Thursday. On that afternoon the session of the Technical Association was held in the motion picture theatre in one corner of the main floor and most of the manufacturers here for the convention took advantage of the opportunity to inspect the exhibits. That afternoon presented a fair-like aspect, with crowds of interested persons gathered about almost every booth, listening to the elucidation of the product and in various cases, watching the thing operate.

Throughout the hours that the exposition was open to the public, motion pictures showed the various processes of the making of paper. Some unusually interesting films, depicted the course of the paper from the rag and the forest to the finished piece of paper. The motion picture corner was always the magnet that drew crowds its way.

The Hammermill Exhibit

One of the first booths to greet the eye upon entering the main hall was the neat and simple display of the Hammermill Company. Always in the foreground when it comes to advertising with taste, the large space occupied by this display immediately attracted the eye. Those little stereopticon machines told of the work of the Hammermill company, while advertising literature was also given out by the wideawake attendants. Assistant Advertising Manager Frampton was much in evidence in greeting the public. About the walls were hand painted pictures of the ancient art of paper making, while seats were plentiful for the tired visitor. The display was wholly educational for the public, and while now and then a real good punch of advertising was done with a printer who came along.

The Continental Novelty Booth

No booth on the floor had quite the uniqueness of the Continental Paper and Bag Mills Corporation. Here a house, roof and all, had been erected of the products of the company. In it were samples of the thousand and one useful articles in paper put out by this company.

The house that Continental built was the gathering place of hundreds of people during the week. Thousands of samples were given out and the visitors at the show went home with a new idea of the possibilities of the Continental company.

Union Bag and Paper

The Union Bag and Paper Corporation had an exhibit that was largely educational. The entire sweep of the big company's operations was illustrated by a painted background giving a graphic idea of the process through which paper passed from "Forest to Counter." A series of exhibits showed the successive stages in the evolution of a paper bag, from the log to the finished paper in bag width and eventually to the completed coffee package on the retailer's shelf. The lumber resources are represented by rough and dressed soft woods and shingles. The pulp includes ground wood, sulphite, kraft and various grades of screenings. H. Stuart Daniels, specialty sales manager at the New York office, was in charge.

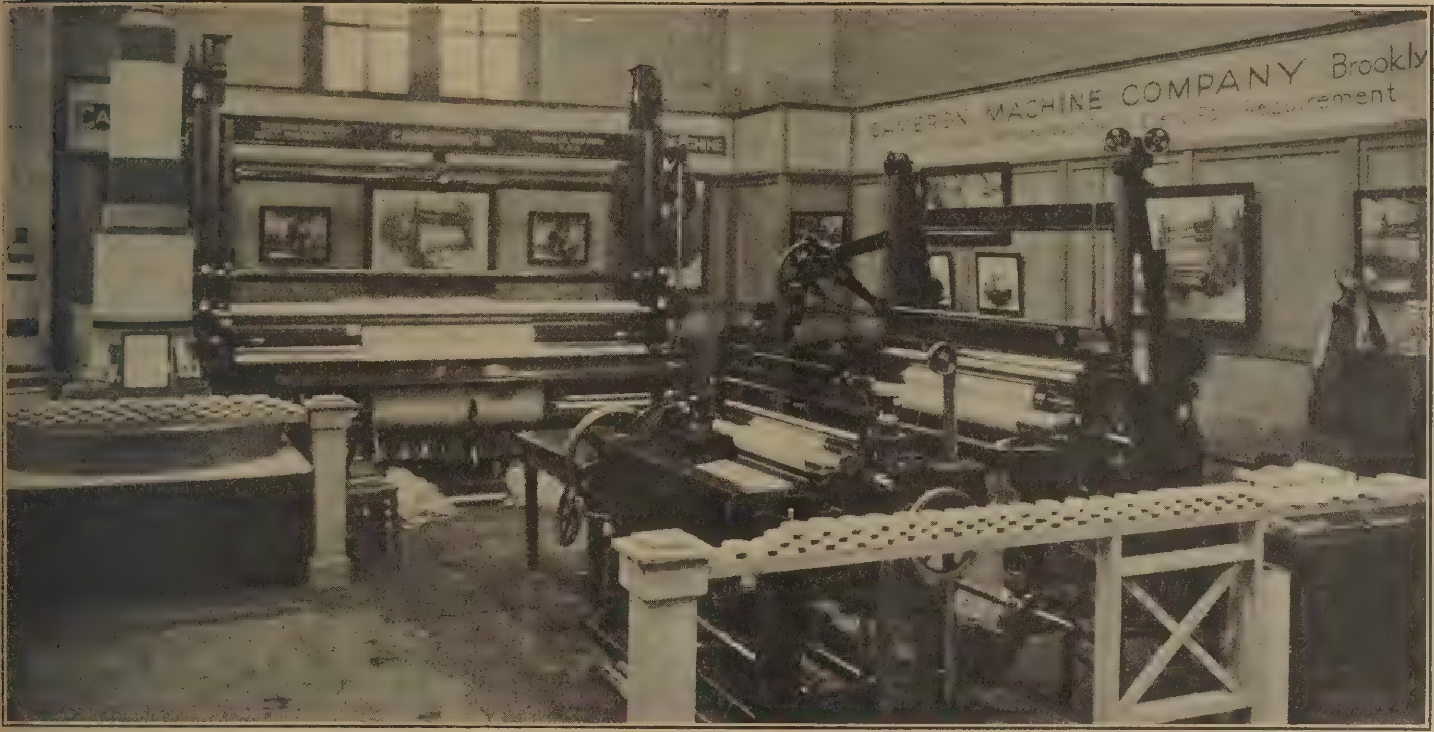
Purity Paper Vessels

With vice president and general manager W. R. Lenderking, in charge, the booth of the Purity Paper Vessels Company showed paper cans and milk bottles and various appliances manufactured for the purpose of furthering the use of paper containers and rendering them more easy to handle as original packages. The Purity paper can is used extensively by ice-cream manufacturers and also for dispensing many other liquid, semi-liquid and dry food products. The exhibit was in charge of Allyn G. Whitehead, supervisor of sales of the Eastern District and he is assisted by John A. Owen, Jr., and Wm. A. Palmer, supervisor of sales of the Metropolitan District.

Seaboard Air Line

Imbued with an abiding faith in the possibilities of the south as the great papermaking section of the country, Charles A. McKeand, general industrial agent of the Seaboard Air Line Railway Company, impressed the crowds visiting the show with his earnestness and wealth of facts. Printed matter was shown on paper made from every type of wood grown on the railroad's main line and tributaries.

CAMACHINE ONE OF THE MOST STRIKING EXHIBITS AT SHOW



One of the outstanding exhibits at the big Paper Industries Exposition is that of the Cameron Machine Company. Impressiveness is combined with practicality in its arrangement and the energetic Cameron staff have accomplished that difficult task of making a machinery exhibit attractive.

Standing back in an angle of the building, a titan of power and efficiency is the huge Camachine 18 mill type winder, which replaced with a happy smile the frown on the faces of winderman, superintendent and mill executive.

Close by is Camachine 10, the favorite of the converters and dealers, who, with its aid, always have a supply of stock on hand for a rush order.

As a partner in efficiency Camachine 6 stands beside its bigger brother. This machine turned out during the week thousands of rolls smoothly slit and evenly wound which were given away to the crowds which thronged about the booth throughout the week. At the same time interesting literature was distributed.

All the machines were in actual operation during the week, so that the visitors could note exactly how the production credited to Camachines is turned out—how good rolls can be made with the minimum of waste and mechanical trouble.

The booth was decorated with numerous photographs, as well as piles of rolls of paper in various kinds, sizes and colors, displaying the many uses to which the roll-paper can be put.

The staff of the Cameron Machine Company in charge, who greeted the visitors and willingly demonstrated the various machines, had an engaging way of making the visiting paper men as well as the general public right at home. A. Krug, the advertising manager, was in charge and he was assisted by J. E. Regan, John R. Cooper, and John T. Norris, of the sales staff. The demonstrators were F. Schatten and John Hawkes. Mr. James A. Cameron, President of the Company, was also on hand to greet his friends.

Mill men, converters and dealers were shown machines in actual operation which could be put to work for them. Many who knew of the merits of Camachines through advertising and word-of-mouth recommendation were enabled to see the machines for the first time, and the reactions were invariably favorable. The exhibit demonstrated most forcefully the truth of the Cameron slogan—

"FOR EVERY ROLL REQUIREMENT"

The staunchness and strength of the Cameron machines was plainly evidenced by the working machines on the floor. They stood there solid, substantial, efficient, both looking and acting like valuable mill acquisitions in building up production. The entire history of the cameron Machine Company is one of progress and advancement and growth. The public had the opportunity to observe at hand just why the company has progressed so fast and built up such an enormous business.

Cameron Machine Company

61 Poplar Street Brooklyn, New York

The wood was shipped to the United States Forest Products Laboratory at Madison for test manufacture, and the resulting paper, in various grades, are the basis of the exhibit.

Leather Belting Exchange

An unusual educational display was that of the Leather Belting Exchange. This is a co-operative display by the various manfuacturers of belting for power transmission in paper mills and other industries. A demonstration machine shows how belts transmit power and the relative values of different types of belting. In addition, there is an exhibition of a leather belt running in water, and another made endless on the pulleys. From both a scientific and a practical standpoint the exhibit is unusual and impressive. This booth always had a crowd around it.

The Potdevin Company

Thousands of little glassine printed bags were turned out right on the floor of the exhibition hall by the Potdevin Machine Company, of Brooklyn. It also had in actual operation at its booth machinery for pasting, gumming and gluing cardboard, paper, cloth and similar materials in sheets, as well as a two-color printing flat and square glassine paper bag machine. Postage stamps and bags are made thereon directly from a roll of paper at the rate of 100,000 daily.

Paper Makers Chemical Company

The huge area covered by the Paper Makers Chemical Company, the Western Paper Makers' Chemical Company and the B. K. Williams Company was well taken up by attractive displays of the products of these companies. A model beater showed exactly how the chemicals worked and throughout all three booths there was much of interest but outdoing all in attractiveness and interest was the operations of Dard Hunter, foremost hand papermaker of the country and great authority of the world. Mr. Hunter uses in his work utensils that were in use in England 400 years ago. The method of placing water-marks in paper is also demonstrated. Mr. Hunter shows a book on papermaking which he produced entirely by hand. This is an extraordinary one-man job from the making of the paper, cutting of the types, to the actual printing and binding of the finished volume. Mr. Hunter not only made the paper on which the limited edition of his book was printed, but devised the type, actually made the type, wrote the text and set the material in the type of his own manufacture. Then he printed the book on paper he had himself made by hand.

College of Forestry

To impress on visiting paper makers the need of conservation of forests, the State College of Forestry of New York had an interesting booth.

Two machines give a constant change of illuminated pictures of pulp and paper manufacture and the reforestation measures necessary to preserve the paper industry. Accompanying these illuminated pictures was an elaborate set of graphs showing forestry conditions, with another series of transparencies depicting wood-lot problems and forest practice in vogue in different parts of the country. The pictures and graphs are cross-referenced by use of ribbons leading from the transparencies to the wall charts. In addition, there are actual displays of small trees, set off by green decorations.

Mayer Coating Machines

The Mayer Coating Machines Company gave a demonstration of how paper is coated. Charles W. Mayer, treasurer of the company, was on hand to discuss coating problems of various kinds, giving descriptive particulars and illustration of the machines manufactured by this concern for waxing, oil saturating, gumming, gluing, varnishing, asphalt coating, clay coating and color coating.

Armstrong Machine Works

The Armstrong Machine Works, in its exhibit, featured a glass model Armstrong steam trap working under steam pressure. This model was connected so that the entire cycle of operation, together with how the Armstrong trap handles air and sediment, can be seen. A. E. Armstrong, president and general manager of this company, was in attendance.

Booth Chemical Company

The principal feature of the exhibit was the new type 24 Booth Dry Feeder. This machine was shown in operation, feeding white water Boothal, the special coagulant used in the separation of the excess white water into its components, thickened stock and clarified water respectively.

After the separation has been made, the recovered pulp, which is collected in the bottom of a settling tank, is returned directly to the paper machine, and the clear water is used in place of fresh water. While it is obvious that the object of using Boothal is to save the stock, it is also a fact that this coagulant continuously purifies the water so that slime producing growths do not occur in a closed system equipped with the process.

Vortex Manufacturing Company

The new folding drinking cup was the feature of this booth. It has an especially constructed dispenser which is non-mechanical, dust proof and requires little space, holding an unusually large amount of cups. The dispenser measures 4½x4¼x15 inches, is compact and can be set up in a jiffy most anywhere. A display of the well known Conical Paper Cups was also shown. The booth was in charge of W. B. Mangold, who was assisted by C. S. Hubbard, New York representative.

F. L. Smidth & Company

The many attractions of the booth of the F. L. Smidth & Company are set forth on a separate page in this issue. Do not fail to read it carefully.

Oneida Chuck Company

A useful new roll collar was featured in the booth of the Oneida Chuck Company. J. A. Lamotte the inventor of this new Roll Collar explained just how much in savings this latest invention represents to the user.

Gibbs Brower Company

Ogden Brower, Jr., and Miss Vera Langfeldt were in charge of the booth of the Gibbs Brower Company, who are well known paper and pulp mill brokers. Many copies of their "Go Between" Bulletin were distributed and many were attracted to the Gibbs Brower booth.

The McGrath-Sherrill Press

Some of the results of many years as handlers of paper mill advertising and the possibilities to be developed were shown by Edgar B. Sherrill and W. Howard Brown, of the McGrath-Sherrill Press. A large collection of direct by mail printing was displayed.

American Schaeffer & Budenberg

The American Schaeffer & Budenberg Corporation had a splendid display of instruments at this booth. They included Indicating and Recording Gauges, Thermometers, Tachometers, Steam Traps, etc.

A particular novelty was a large painting of a portion of a Paper Machine to which was attached their Paper Machine Tachometer in actual operation.

Bachmeier & Company

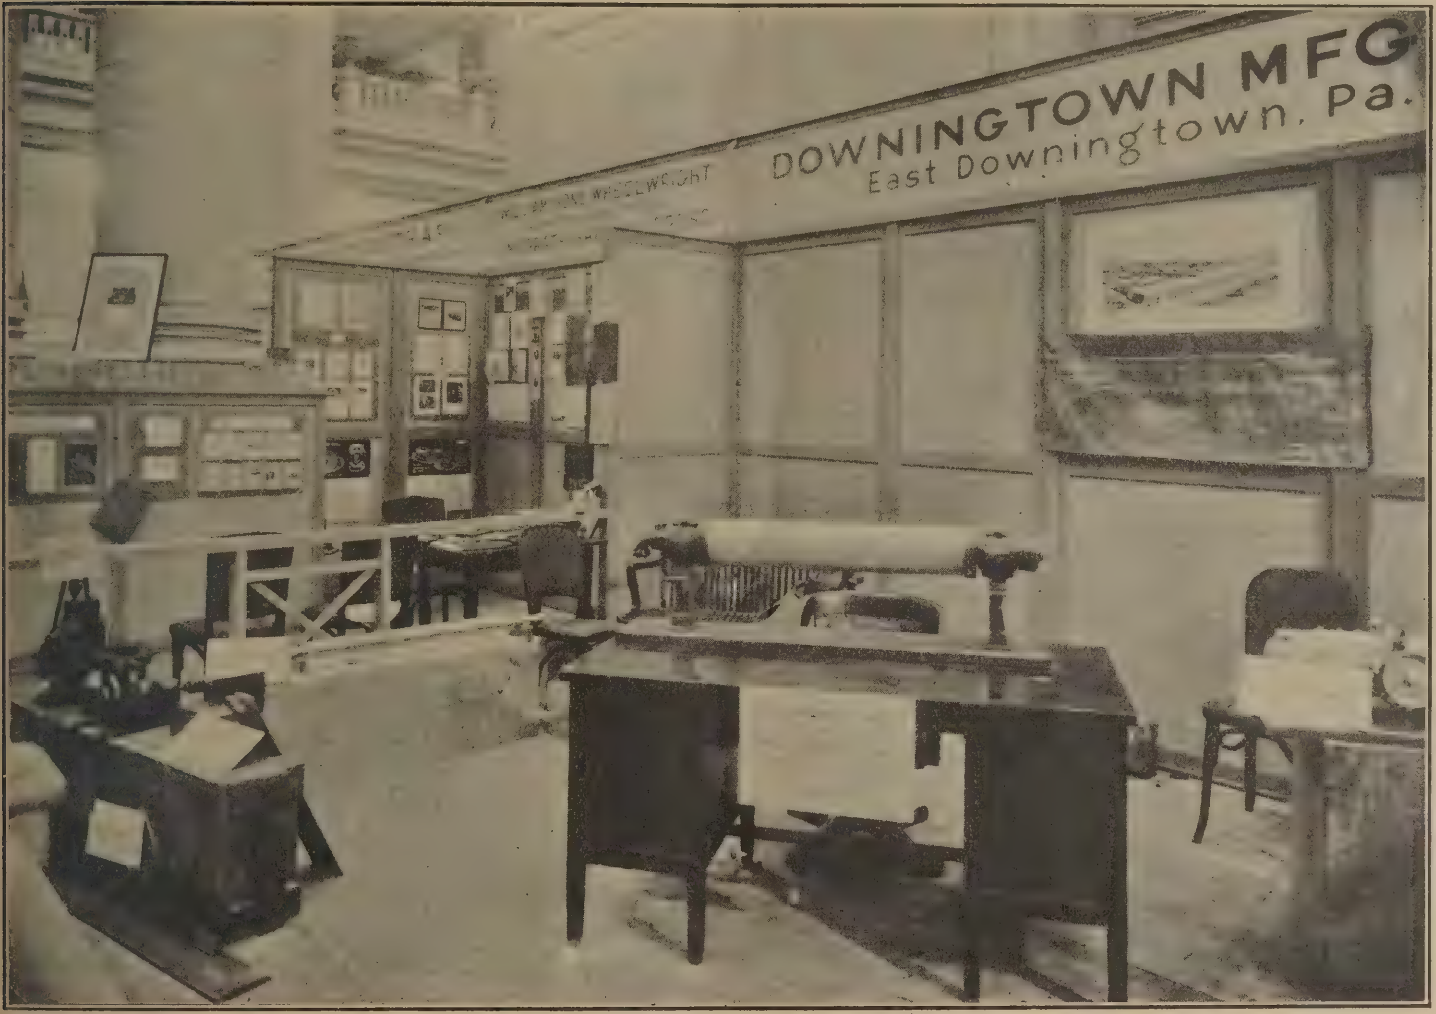
A full description of the booth of Bachmeier & Company will be found on page 128. PAPER urges that you turn to it and read about the various interesting features to be found there.

J. O. Ross Engineering Corporation

With J. O. Ross and a large staff of men on the job, the J. O. Ross Engineering Corporation proved always the center of a large group of interested visitors.

An exhibit of a model of a vapor absorption system on a paper machine in connection with a Briner economizer was a feature. The so-called cross ventilation consisting of varying the ventilating air sideways through paper making machines and so eliminating vapor pockets and enlarging the moisture carrying capacity of the air, is one of the recent developments used with Briner economizers.

KILBERRY SUCTION ROLL MAKES HIT AT THE CONVENTION



For the men familiar with the problems of the papermill one of the most interesting exhibits on the entire floor of the Paper Industries Exposition was the new Kilberry Suction Roll of the Downingtown Manufacturing Company. Because it apparently meets a long standing need of the paper mill, it was the center of attraction for those men who have for years wrestled with the trouble this roll overcomes.

It is the amazing simplicity of the Kilberry Suction Roll that kept the attention of the paper men for so long. It has common-sense bearings about one-half the diameter of the shell. It has an infallible alignment of the suction box to the shell and no adjustments whatever are required. There is no wear on the packings and consequently there are no replacements required. There is a direct jaw clutch connection to the driving shaft, with no gears. Moreover, and above all, it takes less power to drive the roll.

The model on exhibition was demonstrated in an effective way by George D. Kilberry, the inventor, himself well known throughout the trade. With a big black cigar tucked confidently in the corner of his mouth, he pointed out with the spirit that only an inventor can muster, the various good points of the suction roll. He even took it apart before the eyes of the visitors to show how simple and easy of access it is. The roll was praised from one end of the Grand Central Palace to the other, and it was a topic of conversation at the convention headquarters at the Waldorf-Astoria.

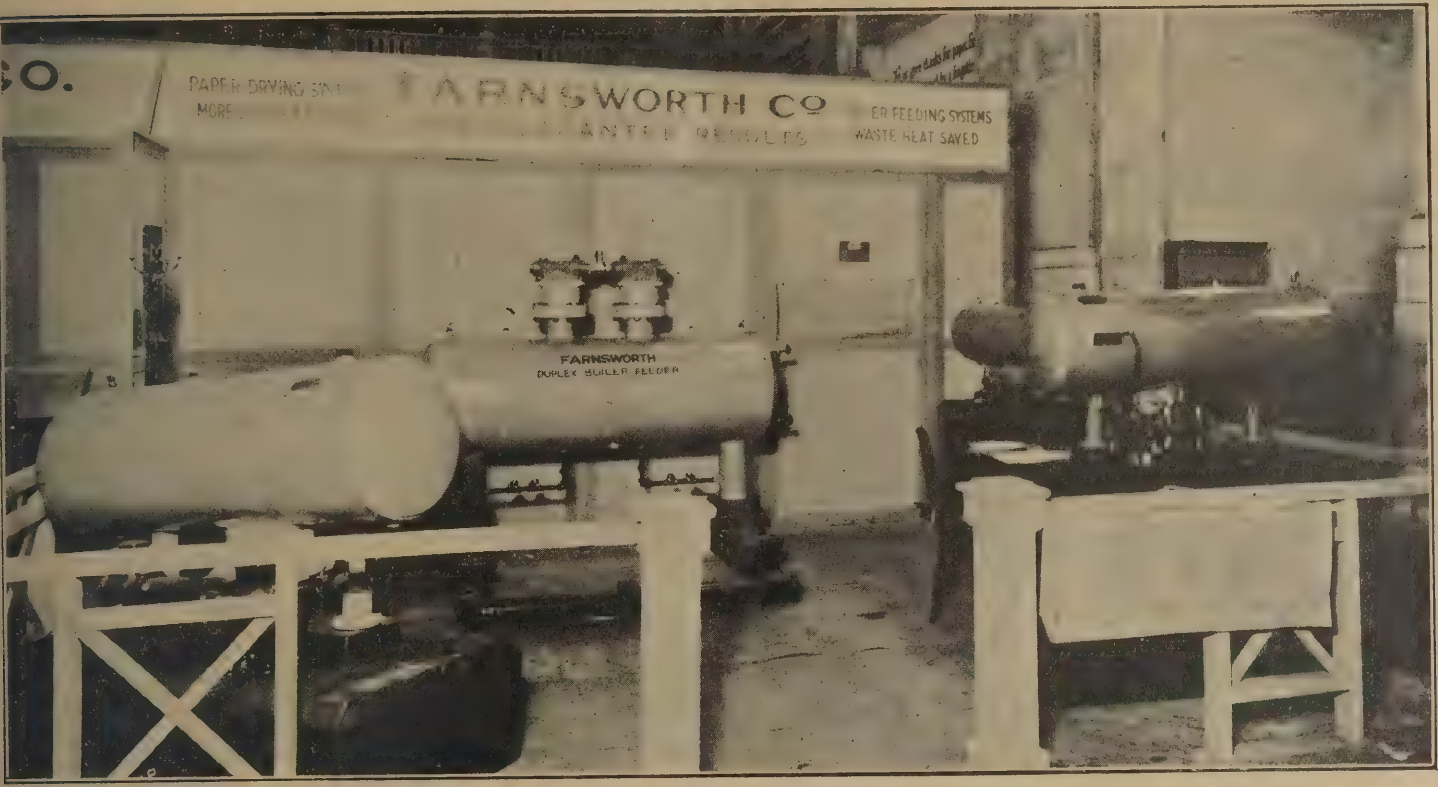
The automatic collapsible reel is another product of the Downingtown Manufacturing Company. This reel is specially designed for winding tissue and other light papers which are finished in a bundle cutter. The object is to save the enormous waste, due to the increased length of the outer sheets when the paper is wound to the increased length with stationary bars. In this reel the bars are collapsed automatically as the web of the paper increases in thickness, thus maintaining a uniform length to every sheet on the reel. This, too, is a well known product of the Downingtown Company.

There were illustrations and literature on hand for the other products of the company. The personality of Mr. Kilberry and his assistant assured a welcome for all visitors whether men familiar with papermaking or merely laymen of the great American public.

Of course, it was impossible to give more than a passing impression of the new roll and the other machines of the company in the rush of the exposition. A good way to learn more about the work of this company is to write to the Downingtown Manufacturing Company, East Downingtown, Pa.

Machinery Exhibits at the Paper Industries Exposition

SIMPLICITY OF THE FARNSWORTH BOILER FEED SURPRISES CROWD



Simplicity, the elimination of all superfluous parts, the getting down to basic fundamentals is an art. The Farnsworth Company, of Norristown, Pa., has mastered that art.

Consequently there was nothing to be surprised at when the Farnsworth booth at the big Paper Industries Exposition was always the center of interest for those interested in machinery and appliances that meet a need and yet are not complicated and involved.

The Farnsworth Drying System and the Farnsworth Duplex Boiler Feeder (newly improved) were particularly notable.

The Drying System has not a single moving part, and provides a perfect graduation of temperatures. The steam enters at the dry end of the Compound Steam and Return header with its water sealed differential regulators, then passes through the driers at a high velocity carrying all condensate and air to the wet end, where the air escapes through an automatic air valve and the condensate enters one Farnsworth Pump which delivers it to the Farnsworth Boiler Feeder thus providing an absolutely closed system consisting of only three units.

Mr. Farnsworth himself was in charge of the exhibit and from his vast store of practical and theoretical knowledge of drying paper and handling high temperature condensate was able to disseminate much information. The Farnsworth Company have long been manufacturers of these systems. The Farnsworth systems are known all over the continent, indeed, all over the world and their reputation for increasing production, saving fuel, and drying better paper have made an enviable and constantly growing market.

The booth of the Farnsworth Company was attractively arranged and made a display that appealed to the eye as well as to the engineering spirit of the papermakers present. Every visitor was welcomed and explanations were willingly given. The huge boiler-feeder in the center was flanked by one on each side of a smaller size. There were comfortable chairs about and many made their headquarters at the Farnsworth booth during the week.

It is the advice of this magazine that if you want to save money in your drying and boiler feeding system see or write to the Farnsworth Company at Norristown, Pa. It is the game the company has studied for many years and it is the game it knows.

The company reported a heavy demand for its products, and reported numerous installations. The business has been steadily growing for some time due to the worth of the product and the ability of the company.

The Farnsworth Company

Norristown Pennsylvania

Valley Iron Works

With the Valley Iron Works exhibit was linked the new Caterpillar grinder of the American Voith Contact Company. Both proved of great interest. The caterpillar grinder was represented by a working model that was amazing in its completeness and demonstrative ability. The Valley Iron Works, with Mr. Peterson in charge, showed the new possibilities of the high pressure inlet, as well as the beaters and other products of the company.

The Reed Air Filter Co.

The soot and dust of the manufacturing centers are coped with by the Reed air filter; as was demonstrated by the Reed Company. Taking a tip from nature adhesive is the chemical used in the Reed filter to act like mucus. It is an odorless, tasteless, non-volatile liquid which has a strong attraction for dust and carbon. It is estimated that Reed filters when effectively operated, remove fully 97 percent of the dust, carbon and bacteria in the air passed through them.

The Crane Company

From the vast variety and stock of valves, pipe and fittings of the Crane Company, a most interesting exhibit was made. Y stop-check valves and the Hoffman Blast traps were particular features of the exhibit.

American Engineering Corporation

The American Engineering Company, Philadelphia, representing the Taylor Stoker Company, Ltd., Toronto, Canada, exhibited drawings and diagrams showing the principles upon which the Taylor underfeed stoker is designed for economizing boiler fuel.

Sandusky Foundry & Machine Co.

Possibly the most impressive exhibit on the exhibition floor was that of the Sandusky Foundry and Machine Company. A magnificent specimen of a Millspaugh suction roll was on display, which amazed the crowd by its size. The new cycloidal vacuum pump being developed also attracted much attention.

These pumps are expected to prove of exceptional value to paper mills as they have an efficiency of from 79 to 83 per cent. This is far beyond the efficiency given by older types of pump. These pumps are compact, strongly built and attractive-looking. All parts that come in contact with acids are made from acid resisting chilled iron which has proved superior to bronze. Samples of engraving, rotogravure, marking, press, print and other rolls were shown together with many other products of the Sandusky Foundries.

Downingtown Manufacturing Co.

With the Kilberry suction roll, which has just been developed and has been successfully working for some time, as the feature, the Downingtown exhibit drew much attention. Mr. Kilberry himself was in charge of the exhibit. This roll is described at greater length on another page, which should be referred to by all means.

Beck Machine Company

How sheets are cut in vast numbers was shown by the Beck Machine Company, of Philadelphia. A roll sheet cutter demonstrated the way sheets are piled up and how great production can be made.

Mining Equipment Company

The Mining Equipment Company displayed a mixing motor of much usefulness in paper mills. It is portable and always handy. It drew much comment.

The Lubriko Company

The Lubriko Company, of Philadelphia, with its grease bricks, demonstrated how it keeps down the temperature of fast flying machinery.

The Faatz Company

Belt dressing in both bars and containers was displayed by the Faatz Company. Mr. Faatz himself was in charge of the booth.

General Electric Company

The General Electric Company had an exhibit that was particularly apropos to paper mills.

A sectional drive for paper mill installations, an electrically operated flow meter, an electric steam generator and other interesting electrical machines were exhibited. An electrically operated G-E flow meter for measuring the flow of steam, air, gas, water, oil and other liquids was a feature of this exhibit which was accorded much favorable comment. This new type of meter consists of a flow nozzle, meter body, and the electrical measuring instruments and voltage regulator mounted on a panel.

S.K.F. and Norma

Both the S.K.F. industries and the Norma Ball Bearing Company displayed ball bearings of various types. One unique exhibit of the S.K.F. was a ball bearing which ran for hours around a disc with no motive power save its own momentum. The Norma Minimeter, which is a true precision measuring instrument, was demonstrated at the Norma booth.

Keystone Lubricating Co.

Greases and oils for paper mills were displayed by the Keystone Lubricating Company.

R. & J. Dick Co., Inc.

Balata belting, which is a substitute for leather belting, was exhibited in striking fashion by the R. & J. Dick Company.

Voorhees Rubber Mfg. Co.

Rubber products were shown by the Voorhees Company. Rubber belting, rubber hose, and rubber steel valves were shown. Sensation belting is a belting of rubber and duck which has proved vastly satisfactory in paper mills.

The Hoe Corporation

The Hoe Corporation, of Poughkeepsie, demonstrated an adjustable wrench with good effect.

Westfield River Paper Co.

A magnificent line of glassine and paperglas samples were on display at the big booth of the Westfield River Paper Company. Embossed and silver coated papers were among the lot.

Kleen Products Company

The exceptional high quality of the products of the Kleen Products Company was demonstrated. Almost complete sets of household dishes, including plates, saucers, knives, forks and spoons were shown.

American Assn. Paper Specialty Mfgs.

With the genial J. F. Willert in charge, the display of the American Association of Paper Specialty Manufacturers, the new organization of the American Paper and Pulp Association, had an interesting display from its member companies. The booth was very attractive.

Seminole Chemical Company

How the Seminole Compound cleans boilers was shown by the Seminole Chemical Company. A full page is devoted to this in this section, which should not be missed.

Westinghouse Electric

The Westinghouse Electric & Manufacturing Company had its system of sectional drives displayed. This system consists of a Type SK motor, coupled to a parallel shaft, single reduction gear, both of which are mounted on a common bedplate with a chain driven speed charger and rotary contractor; a master rotary contractor unit; a sectional control panel, and a master control panel. This equipment was not connected to any load, but was demonstrated in operation from start, fast, slow and stop, push buttons. Speeds in terms of feet per minute of paper were shown.

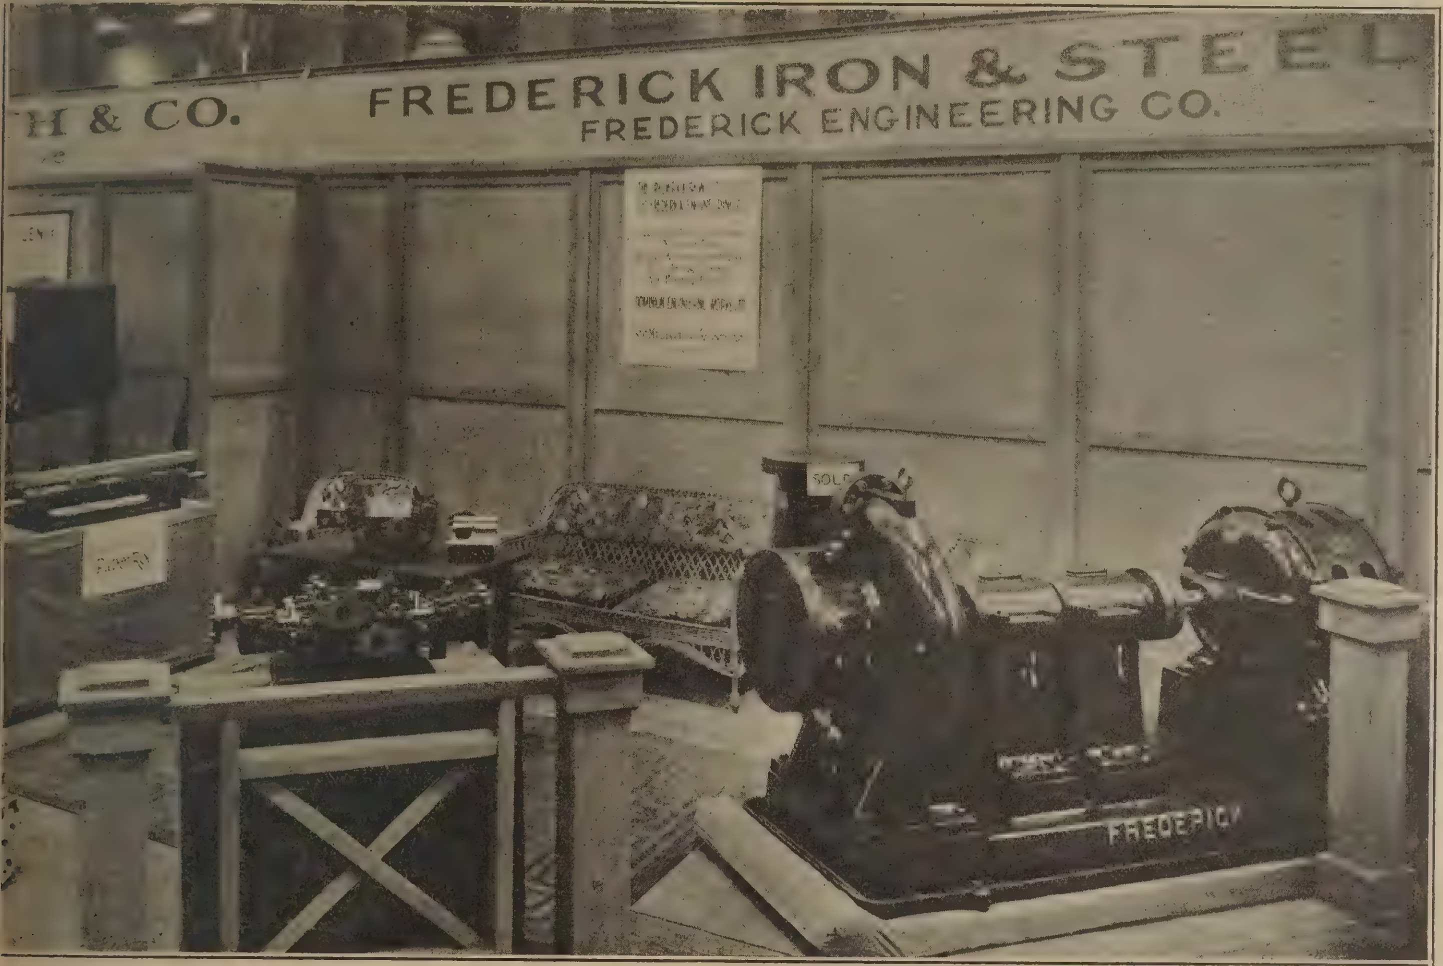
W. S. Tyler Company

The electric screens and testing sieves and woven wire screens for paper mills were shown by the W. S. Tyler Company, of Cleveland. Samples of Fourdrinier wires were also shown.

Tide Water Oil Sales Corp.

With the Tydol oils and greases effectively shown, there was much interest in the booth of the Tide Water Oil Sales Corporation.

FREDERICK HEAVY DUTY STOCK PUMP CENTER OF INTEREST



Impressive and capable-looking was the exhibit of the rederick Iron and Steel Company at the Paper Industries xposition in the Grand Central Palace.

The Frederick heavy duty high consistency stock pump vas the center of attraction at the booth throughout the veek. So well did this pump impress the paper manufacurers who visited the show that several orders were given t the moment.

This single suction centrifugal pump was developed and laced on the market to supply the insistent demand for high grade pump for the pulp and paper industry.

The model on display was the result of the most thorugh investigation into the pumping requirements regardng the manufacture of paper. It is recognized that cenrifugal pumps are among the most useful of all pumps or mill work. Efficiencies of from 60 to 65 per cent. are btained under actual running conditions when handling ulped stocks having a consistency of about 3 per cent. ulped stocks having consistency of from 4 to 4.5 per ent., handled with ease and minimum power consumption.

W. A. Riddell, the energetic president of Frederick Iron & Steel Company, took personal charge of the booth during several of the days and his staff of helpers also were always on the job, greeting visitors, courteously showing them the manner in which the pumps operate and making the guests feel at home. Mr. Riddell also met many of his old friends at the booth.

The manufacturers of paper themselves displayed an unusual interest in the exhibit. The fact that the pump fills a long and constantly increasing want in the industry caused these deep thinking manufacturers to ponder well on the qualities of the Frederick pump.

It was brought out plainly to them that the casing is of best quality, close grained grey iron, cast in halves, split horizontally on the center line of the shaft permitting ready access to the interior parts of the pump. The impeller is of the high efficiency, semi-open type, with waterways correctly proportioned, of easy curvature and liberal area. Each unit is made with the view of long, hard wear.

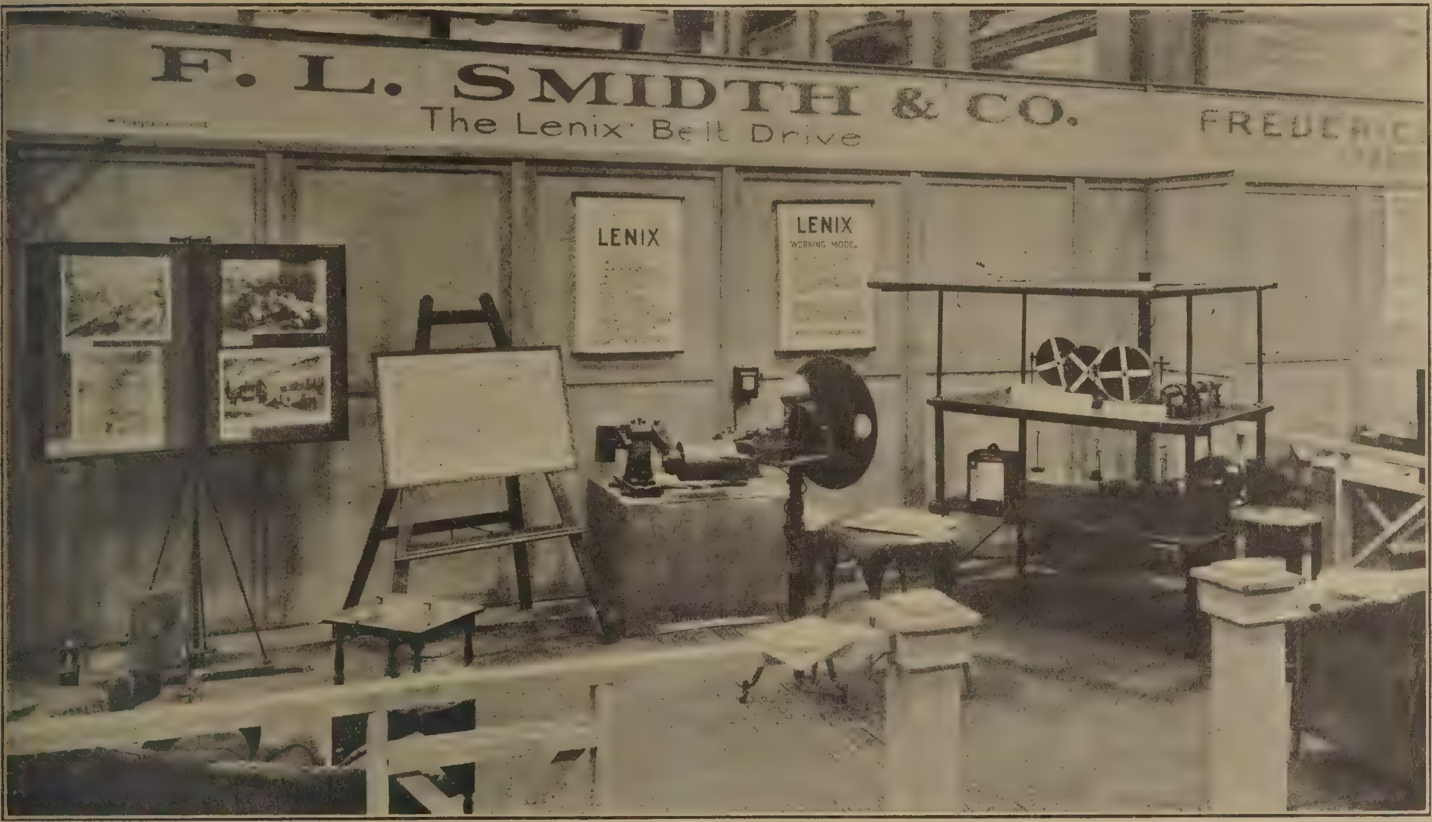
Educational Exhibits at the Exposition

THE LENIX DRIVE A REVELATION TO MANY PAPER MANUFACTURERS



Although the art of papermaking is an ancient one, many long-experienced papermakers learned something new at the Second Paper Industries Exposition at the Grand Central Palace the week of April 7.

Notable in this absorption of education was the Lenix Belt Drive, displayed by F. L. Smidth & Company, Engineers, of 50 Church Street, New York. In the Smidth booth the Lenix drive proved itself a revelation. And this despite the fact that it is already in use in several score paper mills of North America.

It was graphically brought out at the exhibit that in mechanical engineering long center belt drives installed with the full knowledge that they are compromises, because of the belief that sufficient and efficient use cannot be made of the pulley surface areas. For eighteen years the Lenix has disproved that belief by transmitting hundreds of thousands of horsepower with short pulley center drives, at the same time increasing efficiency and economy.

Short center belt drives with the Lenix have in general proved superior to long center drives. The Lenix uses a large part of the hitherto unused surfaces of the belt and pulleys. If automatically, permanently, constantly and accurately maintains the proper tension on the slack side of the drive without springs, that is, entirely by gravity. Counterweights permit accurate adjustment to the normal load. The Lenix automatically adjusts itself to peaks and valleys in the load.

Each Lenix is adapted to the prescribed conditions of installation and service. Each adaptation involves the co-ordination of such factors as the sizes and relative locations of the driving and driven pulleys; the belt speed, thickness and pliability; the horsepower to be transmitted, and frequently conditions of moisture, temperature, dust, fumes, etc., to insure the greatest efficiency. Since the proper working of the Lenix is not influenced by the direction of belt travel from a center, or which side of the belt is tight, these factors need no consideration.

Eighteen years' experience in designing and manufacturing the Lenix in units of from 1 to 1400 H.P. has proven the impossibility of fulfilling all of these requirements by means of standard units. But, for use in connection with standard two-bearing motors from 1 up to 100 H.P., it has been found possible to develop a number of standard units kept in stock and promptly available.

Comparing old established practice with open drives, the Lenix has proved that (1) because of freedom of pulley location saves floor space, building space and first cost of belting; (2) because of reduced bearing pressures, saves bearing friction, lubrication and renewal of bearings; (3) because of automatic features saves maintenance cost and attendance; (4) by permitting higher pulley ratios allows the use of less expensive, higher speed and higher efficiency motors or generators of the two-bearing type, in sizes larger than are used for open drives.

The apparatus used in demonstrating the value of the Lenix and which is here picture brought home to many manufacturers how much money they have been losing by neglecting to previously see its possibilities.

With Mr. Zahn in charge of the booth, and with a courteous staff of workers, every visitor was welcomed and made at home, and many of them admitted that their short visit had been an education to them.

The Dorr Company

With it shown in actual operation, recovering waste stock from white water, the Dorr Save-All, which is manufactured by the Dorr Company, engineers, of New York, Denver and London, England, consists of a steel tank with a number of trays dividing it into settling compartments, all connected by central openings in the trays. A slowly revolving central shaft carries radial arms with squeegees, each arm sweeping the bottom surface of a compartment.

The Nash Engineering Company

With the energetic Mr. Wright in charge, the huge and impressive exhibit of the Nash Engineering Company, of South Norwalk, Conn., showed the Nash Hytor Suction pump as well as the Jennings Hytor Vacuum Heating Pump, electric motor driver, designed to exhaust a vacuum and return all condensation in connection with vacuum return line steam heating systems; the Jennings Hytor Vacuum Heating Pump, steam turbine driven, for return line heating systems and other vacuum work where liquid is handled with a gas; and the Jennings Hytor Condensation Pump, unit type, electric motor driven, designed to handle condensate from steam heating or drying systems.

Locke Regulator Company

The Locke Regulator Company, of Salem, Mass., showed the regulator to not only control the temperature of the driers when the paper is running over them, but maintains the same temperature whenever there is a break in the paper.

Pennsylvania Salt Mfg. Co.

Among the chemical products of the Pennsylvania Salt Manufacturing Company shown were Sulphuric Acid 60° (Oil Vitriol); Muriatic Acid 18°, 20° (Hydrochloric); Aluminum Sulphate (Sulphate of Ammonia); Natrona Porous Alum (Iron free); Natrona Concentrated Sulphate of Alumina (Iron free); Excelsior Sulphate of Alumina (commercial), all grades of which are used for paper, color, dye and tanning industries and water filtration plants.

Shepard Electric Crane

The many possibilities of the electric crane were demonstrated effectively by the Shepard Company. An electric lift of simple construction was shown in operation.

National City Paper Co.

The extraordinary value of the booth of the National City Paper Company was evidenced by the huge crowds thronging about it all week. The paper testers and scales were ably demonstrated. Attention is called to the page devoted to it in this section.

Cameron Machine Company

Attention is called to the fact that a splendid descriptive article of the Cameron booth appears on a separate page in this section. Do not miss it.

Union Sulphur Company

Brimstone, free from arsenic or selenium, which is produced by the Union Sulphur Company featured the modest exhibit of this company. But visitors were always welcome.

United States Testing Co., Inc.

The value of real tests of paper were demonstrated plainly to the paper manufacturers by the United States Testing Company.

This included tests to determine the tensile and bursting strength of paper, and the folding endurance. Microscopic tests for the examination of the fiber were also demonstrated.

This company has offices in New York, Philadelphia, Paterson, New Bedford and Shanghai. A complete laboratory is in operation in key cities for use by paper men.

Bird Machine Co.

The Bird Machine Company exhibited a Bird Rotary Inward Flow Screen, a Bird Save-All, a Bird Self-Cleaning Shower Pipe, a Vickery Felt Conditioner, a Vickery Doctor and a Pullman Short Centre Drive. The valuable factors of the Vickery Felt Conditioner, which was in operation during the week, were thoroughly explained to those interested. The Vickery Doctor was also mounted to enable the expert demonstrators to explain its many advantages. The Bird Self-Cleaning Shower Pipe, a Vickery Felt with water and its principle was explained under actual operating conditions.

Lehigh Lime Company

The Lehigh Lime Company, formerly the Mitchell Lime Company, manufactures high calcium chemical lime exclusively, specializing in the requirements of the paper industries. Nearly half of the output is shipped to paper mills for liquid chlorine bleach, sulphate, cooking of rag stock, strawboard, and for water treating. In addition to high available calcium oxide content, Lehigh lime has earned a reputation for rapidity and depth of settling, which is an important feature in connection with the liquid chlorine bleach and the sulphate process. The plant is located at Mitchell, Ind.

The Mathieson Alkali Works, Inc.

How the Mathieson company transports its product was shown by a complete model car loaded with tanks. This is the car that has been approved by the Interstate Commerce Commission recently. The model shows the many unique features of the multi-unit car, together with the unloading by means of a manifold and headers. A full-sized Mathieson ton container, as used on this car, was also exhibited and was sectioned at one end to show the construction in detail. Samples of Eagle Thistle caustic soda, soda ash, and bleaching powder were given away.

The Permutit Company

The feature of the exhibit of the Permutit Company, of New York, was the operation of a small size Permutit water softener. This apparatus occupies very little space in the plant. It attracted much attention.

The Farnsworth Company

Something new in boiler feeds were shown by the Farnsworth Company, of Norristown. With Mr. Farnsworth present everybody was welcomed. The complete story of the Farnsworth product is taken up in detail in another page, which should not be missed by any means.

Frederick Iron and Steel

The sign "Sold" early appeared in the booth of the Frederick Iron and Steel Company, which simply showed that a worth while product was proving its value to the paper mill owner. A page is devoted to the Frederick products in this section, which should be read carefully.

* * *

International Paper Report

The International Paper Company reports operating revenues of $8,074.577 for 1923, against an operating loss of $1,047,128 in 1922. After reserves for depreciation, Federal taxes and interest the company reported net income of $3,809,540. This, after preferred dividends, was equal to $11.59 a share earned on the $19,931,984 common stock outstanding at the close of 1923. After reserves for depreciation, inventory adjustments and other deductions the company reported a loss of $7.572,390 in 1922. The surplus after dividends in 1923 amounted to $2,309.540, while in the previous year the company reported a deficit of $9.072,390 after preferred dividends. The profit and loss surplus on Dec. 31. 1923. amounted to $17.112 330, against $14,802,790 at the close of 1922.

The general balance sheet on December 31. 1923, showed net present assets of $31,247.972, against net current liabilities of $14.005,766, leaving the company working capital of $16.642,206.

Commenting upon the paper situation of the country, Philip T. Dodge. president, in a statement to stockholders, said:

"There were produced by the company during the year 537.927 tons of paper—the largest production in its history, and double that of any other producer in the world. Of this amount 352,518 tons were news print and the balance higher grade paper of various classes.

"The consumption of news print paper in the United States in 1923 was greater than in any previous year by 13 per cent. being substantially 2,800,000 tons, of which 2.600,000 tons were produced in North America, and the balance imported from European countries. The production in the United States was 1,485,000 tons.

"At the present time the company and its subsidiaries own in fee in the United States and Canada 1.639,000 acres of timber lands. and also control 2,875,000 acres of crown and leased lands."

NEW BOILER CLEANING METHOD SURPRISES MANUFACTURERS

An entirely new method of Cleaning Boilers was demonstrated by Seminole Chemical Company at the Paper Industries Exposition. This method, evolved and supervised by a group of chemists and engineers, utilizes a powder preparation possessing a unique physical action.

In the exhibit were specimens of sludge and scale removed from boilers of nationally prominent plants representing many different industries.

A microscopic exhibit clearly showed why Seminole had been successful in these feed waters of widely divergent character as well as in waters contaminated by oil returns, when soda and other chemical reagents had failed. In the case of chemical treatment, the slides showed that the sludges were not materially different from the crystals formed by the evaporation of *untreated* waters, and in fact, had the same ability to adhere to boiler metal as the crystals from untreated water. The Seminole treated sludges from a wide range of varying feed waters, invariably showed a "pebbly" formation due to physical absorption of scale forming particles by Seminole. These microscopic "pebbles", which contain all the original Seminole, plus a definite proportion of encrusting salts, readily settle out and lodge in the mud drum. The presence of Seminole prevents their adhering to the boiler metal.

Written testimonials, some of them from well known and conservative papermakers, corroborate the claims of the Seminole Chemical Company concerning the new economies introduced in boiler operation by the use of Seminole. Their claims of eliminating scale from boilers and in most cases, of doing away with turbining, their claims of eliminating tube losses due to scale and return oil, their claims of minimizing blow-downs and repair costs, are graphically supported by personal experiences over the signature of important engineers, among them Mr. Walter N. Polakov, the eminent consultant.

The Seminole Chemical Company stand ready to study the boiler operation of any paper plant, and submit their estimate of costs and savings by the use of their method. For further information, address

The Magazine of the Paper Industry
SCHOPPER STANDARD BOARD SCALE
SCHOPPER FOLDING ENDURANCE TESTER
SCHOPPER RAPID TENSILE STRENGTH & STRETCH TESTER
SCHOPPER WORLD STANDARD PAPER TESTERS
INSTRUMENT

The Foreign Paper Mills of 72 Duane Street, New York, had one of the most interesting exhibits at the Paper Show. All the Schopper Scientific Paper Testers were on display, and operated and explained by those in charge.

The Schopper Folding Endurance Testing Instruments created a great deal of interest, as the demand for the Schopper Folding Endurance test is fast becoming recognized by the first authorities as one of the best tests of the wearing endurance of paper. It was shown that some of the best quality rag papers folded a thousand double folds whereas the same weights in a sulphite paper would only fold fifteen or twenty times, thus immediately showing that one sheet was suitable for long life under constant usage whereas the other was suitable for advertising purposes that found their way into the scrap basket in very short order. It was explained each quality should be used for the right purpose.

There was a large display of the Schopper Scales, as the Schopper line of scales meets every purpose, such as—for weighing full sheets giving a direct reading of the weight per ream of any size used; Small Piece Scales which give the weight of paper by weighing a small piece in the size of 4 x 4″; Board Scales which show the actual weight of one sheet and the number of sheets contained in a 50-Pound bundle. A new scale was exhibited showing the basic weight per 1000 Square Inches, which is in accordance with the new movement on foot to establish a standard weight in the paper industry by 1000 Square Inches instead of the old method based on various trade sizes.

The Schopper Standard Desk Micrometer is too well known an instrument for any comments. Recently the Testing Materials Association gave the Schopper Desk Micrometer another big boost on account of its past performance and its accurate and perfect construction.

DYESTUFFS DISPLAY AROUSES INTEREST OF PAPERMAKERS

BACHMEIER & COMPANY. INC.
NEW YORK
Boston ~ Philadelphia ~ Buffalo ~ Chicago
BACO DYES FOR PAPER
Domestic

Both the practical and the technical paper man was deeply interested in the dyestuffs exhibit of Bachmeier & Company, Inc., at the Paper Industries Exposition.

The vast possibilities of dyes was unfolded before the visitors at the show in a graphic, striking manner by the Bachmeier Company. The dyestuffs were particularly fitted to be used in

HIGH GRADE BONDS
WRITING PAPER
PAPER BOARD
NEWS BOARD, ETC.

Two special colors displayed with practical samples, and which were made under actual working conditions in the mill, were—

BACO INDATHRENE BLUE R S TRIPLE POWDER
(For Paper)
BACO PULP YELLOW G N POWDER

The Blue is a highly concentrated dye and produces tints, and shades which are absolutely fast to light, acid and alkali.

The Yellow is used for the very bright, greenish tone shades of cream and yellow, having excellent fastnesses to light, acid and alkali.

A full line of Lake Colors for coated papers was also shown, these being a very high grade line of dry colors.

Of special interest was the Composite Photograph showing all of the mills of the American Writing Paper Company, together with the Division in which the Blue for tinting high grade bond papers, is exclusively used.

A new insight into dyes for the paper mill was given by the staff of the Bachmeier Company to the visitors at the booth. The consumers of dyes especially displayed great interest in the colors shown and the discussion of the attendants. Throughout the week there was always an engrossed group about the booth.

Bachmeier & Company have long been leaders in dyestuffs for paper mills. Their prestige has been steadily rising higher and their business increasing.

OVERNIGHT BY BOAT TO NEW YORK

Special Soft Rubber Rolls for Paper Machines

By **R. H. WHITNEY***

THE results arrived at in this discussion are based almost entirely on the stated purpose of the Technical Association of the Pulp and Paper Industry:—"An interchange of ideas among its members in order that processes of manufacture may be made more efficient and improved along technical lines." We are indebted to S. D. Warren Company, Hammermill Paper Company, Michigan Paper Company, Fletcher Paper Company, and others for comparisons made between the new soft rubber rolls and those previously used. Especially do we appreciate the cooperation of H. F. Obermanns of Hammermill Paper Company who has given much time and assistance in obtaining accurate data.

Corrugation

Papermakers generally have wanted to use softer rolls but have not been able to do so because the old line soft rubber covers corrugated quickly. This resulted in constant regrinding and production loss. In our table we have had to omit figures on the length of time these new rolls have run without corrugating because none of these have yet corrugated. There are 50 in operation and so far only 2 have had to be reground. (Reports on these were not available for this paper. With 48 out of 50 running from 1 to 9 months and showing no sign of wear we believe that this question is answered to everyone's satisfaction.)

Water Removal

How much water will they remove? Naturally a harder roll should take out more water than a soft one. The pressure is applied along a small contact area and is greater per unit area with the hard roll. Yet looking at the tabulation of actual service results you will see that these new soft rubber covers testing 92 to 102[1] are removing as much as former rolls testing 45 to 60 with the same pressures, speeds and felts. In one case there is a slight increase indicated with the soft roll, in another a practically negligible loss of ¾ of 1 per cent is reported. All others are taking out the same amount as formerly. I could amplify this by ten verbal reports (some based on laboratory moisture tests) that show the same satisfactory result.

The evident conclusion was most surprising to me; it may be to many of you. The only way we can account for it is that the extreme resiliency and comeback of the new compounds aids in the squeezing action and compensates for hardness in the former covers which lacked this resiliency.

It is generally recognized that the use of a more open felt allows greater removal. The softer rolls have repeatedly proved that they go far in eliminating felt marks, thus making more open felts practical. In one mill they are now successfully using a more open felt with the soft rolls, and while it is not yet possible to publish the results we know these are satisfactory.

More pressure can be used with the soft rolls without harm to the sheet or felt. Naturally this is harder on the roll, but in one case an additional 3600 lbs. has been added and the soft roll has been running for 5 months without showing any ill effects. The increased pressure took out more water.

Summing up the investigation as to comparative water removal: we have found that the new soft stocks are satisfactory in all cases; also they pave the way for taking out more water in the press, which will reduce drying costs and make higher speeds practical on present machines.

Felt Efficiency

The reports tabulated give such a clear picture of the increased felt efficiency with the softer rolls that little discussion is necessary.

Wherever any attempt has been made, or other factors permit, felt washing has been reduced from 33 to 70 per cent. This is truly a big advantage in many ways, and measured in dollars and cents this item alone will in most cases more than pay the roll cost.

We find that felts last from 25 to 50 per cent longer with the new soft rolls than they did before. A score of additional verbal reports say the same thing and in only one instance can we find that felts have given only equal to previous service.

These results are fine, but they are going to be a lot better. Again we must recognize that the soft rolls allow for more open and harder twisted felts. These will be tougher and last still longer ,and they will not fill up so quickly. So once again, what has been accomplished points ahead to still greater efficiency.

General Application

We have been talking entirely of first press rolls. It may be interesting to note other applications of these new soft stocks in some of which they have already proved advantageous.

They are running on second and third presses showing no weakness and helping the felt and sheet. On a smoothing press their ability to maintain a natural surface longer than old line compounds makes them exceptionally good. You will be interested in the surface of the roll on exhibition in Booth 44A of the Exposition. This shows more clearly than I can tell, the extremely smooth finish which the new covers acquire after 1 or 2 weeks in operation and maintain throughout the life of the roll. One mill says they are the finest thing ever seen on a smoothing roll.

Running in hot glue at a temperature of 170 deg. Fahr., they have already exceeded previous service from other covers and are still going strong. We have them on waxing and sizing rolls and while it is not yet time to make established claims it is only logical to expect that wherever heat is encountered the new stocks will be a great improvement as you will see shortly.

For squeeze rolls and primary presses they have given absolute satisfaction and are now being tried out on the regular press of machines making heavy board. Two rolls have also been covered for top suction rolls although we make no claims for this work as yet.

Although, being less affected by age, maintaining a natural surface longer, resisting heat, and giving greater cushioning, these new compounds apparently offer opportunity for economy on paper machine rolls in general.

The New Rubber Compounds

Questions come up as to how these new stocks differ from the previous rubber roll coverings used. To answer this requires some consideration of rubber manufacturing problems and means of determining physical properties of different compounds.

The problem of covering a paper machine roll becomes involved by the necessity of tying the cover to the metal core with a hard rubber or vulcanite base. The coefficient of contraction of hard rubber is several times greater than metal and as it remains rigid after curing there is a powerful grip between the two. In turn, the base and cover being cured at the same time unites these and anchors the cover.

The roll is given one cure which must be long enough to cure the hard rubber. It is obvious that the soft rubber cover and the base must be perfectly balanced or the cover will have been overcured when the hard rubber is cured to its proper and necessary hardness. Practically all cover stocks were formely overcured when the base was properly cured.

The results of overcuring are not seen immediately after cure, but in the course of several months these compounds lose their resiliency and comeback. In addition an oxidized skin or crust forms on the surface, which offers little resistance to abrasion. On press rolls a soft cover is flattened out at the point of contact. The cover must have resiliency to regain its original shape during each revolution. As the old stocks lost their life this distortion showed itself by a washboard appearance on the surface of the roll, which simply means the rubber had lost its ability to resume its natural shape after being flattened out. Soft stocks compounded along new lines and adjusted to a hard rubber cure, when aged in the life oven and put through a hysteresis test at once indicated unusual ability to withstand internal strains over a long period, and to maintain a natural surface.

The life oven is used to artifically age rubber. By applying a predetermined temperature we may for instance represent a year's normal aging by 2 days in the oven. The hysteresis loop is the cure developed by a tension arm during constant stretching and contraction of the rubber. This measures the fatigue of the rubber from internal rearrangement (as evidenced by heat) and compares roughly to the action a roll must withstand in service.

A comparison of the new compounds with the best old line stock obtainable is shown in figures taken from several of these curves. The old line stock has a hardness of 50. Against this we show the new compound "Kraft" of the same hardness, and the new "High Speed News" testing 95. It is of course difficult to get an accurate relation between compounds of different hardness, but remembering that in each case the cure has been balanced to a hard rubber cure the results are of value, and have so proved in actual service. The efficiency of the first loop is of no value for our purpose as the internal arrangement to working conditions has not taken place. We have therefore taken results at the fifth loop or distortion of the rubber.

With results taken directly after curing, after a medium aging and after comparatively long aging we get these figures:

EFFICIENCY

Sock	No aging %	Medium aging %	Long aging %
H.S.N.	86.1	83.7	80.7
Kraft	82.7	68.6	42.4
Old compound	63.9	Broke down	Broke down

---

* Speed with previous roll was 400 f.p.m. ** No attempt made to cut-down washing. These rolls have been in service for an average period of 4½ months.

The comparison with HSN must include the fact that being much softer it is distorted more in service, but the other two are on exactly the same basis and these figures leave no room to question the superiority of the new compounds.

This last chapter may have seemed so distinctly a treatment of rubber as to be irrelevant here. However, we have already shown that these newly developed soft rubber compounds as roll covers—

1. Do not corrugate quickly causing expense or production loss due to regrinding.
2. Remove the required amount of water.
3. Pave the way for taking out more water.
4. Cut down felt washing.
5. Increase felt life.
6. Decrease felt marking.
7. Allow the use of more open and tougher felts.
8. Make higher speeds and more continuous production possible.

In doing these things we believe they fairly earn at least this superficial explanation as to how they stand as a real advance in the chemistry of rubber brought to the service of the paper industry.

TELLS HOW SOME IMPORTED PAPER IS MIS-CLASSIFIED

Report of Import Investigations Tells In Detail How Fight Was Carried On in Last Few Months

INVESTIGATIONS of abuses of the customs laws, carried on by the American Paper and Pulp Association for many months past, warrant the following summary of conditions as seen by officers of the Association:

1. Abuses of the laws have resulted in the bringing into this country of paper in such a manner as to cause a serious disturbance of the domestic market in many grades of paper.

2. The effects have been rather due to the psychological reaction to the broadcasting of offers of small quantities of paper at absurdly low prices than to any actual large quantity imports of such paper.

3. Pernicious activity of the importers is rendered more serious by the engaging of specialists from the customs department to serve the importers as counsel.

(a) Legislation should be sought to prevent any government official's retainer by outside interests for practice before any government bureau in which he has been employed within a period of two years.

(b) The industry should use its efforts to secure for the customs division of the Treasury Department such salaries and additional assistance as may make it possible to keep in the government service these trained men of ability, and to give them sufficient assistance as they used to function most effectively.

Some of the Abuses Prevalent

4. Customs abuses involve the improper classification of foreign papers offered for import into this country, the dumping of foreign papers at less than the prices in the country of origin, and the criminal undervaluation of paper when it is brought into this country.

(a) Legislation is needed to make possible the collection of the proper duty upon paper which has been improperly classified, when it is found, after the fact of such importation, that the importers have successfully evaded the customs laws.

(b) Great difficulty is encountered under the provision that proof of injury must be presented by domestic manufacturers, before a ruling of dumping can be maintained. At present the customs authorities are forced to secure specific evidence of injury to individual manufacturers before a dumping ruling can be made; the successful sale of such "dumped" paper in competition with domestic manufacturers should be sufficient evidence of injury to American industry.

The details of the work done by the Association in its efforts to eliminate unfair competition from abroad would make an overlong report. It may be stated, however, that the investigations show that the importers are using the blanket provisions of the clauses providing duty-free entry of newsprint, and the clauses fixing duties on "printing" and wrapping papers as a cloak for constant efforts to get paper into the country improperly. In view of the widespread nature of these efforts, the customs service is to be complimented upon its vigilance in enforcing the collection of proper duties. The wonder is, not so much that much paper is coming in improperly, as that so many importations are caught and reclassified before they are offered in the domestic markets.

How Paper is Mis-classified

The chief abuses under the mis-classification headings are the efforts to bring in book paper as standard news, parchmentized paper (later marketed as parchment) as wrapping paper, typewriter paper as printing paper, and valuable special papers under the blanket clauses printing paper and wrapping paper.

The ending cases under the anti-dumping statute are chiefly on Canadian kraft, many shipments of which are now under investigation.

Under-valuation cases are handled directly by the customs authorities, through close contact with paper prices abroad.

The entire import situation involves highly complex problems, both of customs laws and customs, and of technical character of paper being brought into this country.

As a result of the activities of the American Paper and Pulp Association, many importers who had been devoting every effort toward tricking the government agents, are now more careful to enter their imports in conformity with the law.

It should be stated that many importers, men of high repute and honorable character have been careful to conduct their foreign business in accordance with the spirit and the letter of the law. Others, however, less scrupulous, are no better than the bootleggers of "Rum Row," devoting every effort to swindle the government by evasion of the law, to the detriment of honest business. It is against this unfair competition that American industry is justified in conducting a relentless warfare.

* * *

Mill in Louisiana

Plans are being made to establish at Bastrop, La., in the near future a large pulp and paper mill representing an investment of several million dollars. Citizens of Bastrop have secured an option on a site which they will tender the promoters of the mill, having already subscribed $30,000 toward the purchase. The Bastrop Pulp & Paper Co. is already operating a large mill here, having been attracted by the proximity of the forests from which pulpwood is obtained and also by the fact that natural gas can be used to operate the plant.

* * *

The Gatti Paper Stock Corporation, of which Joseph Gatti is president and which is one of the best known suppliers of papermaking material in the New York district, announces that it will move its offices on or about May 1 from 200 Fifth avenue to the Liggett Building, 41 East Forty-first street, New York, where Suite 805-806 will be occupied.

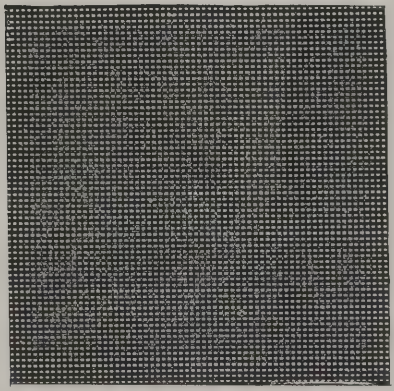
WIRES



Examine this wire. This is an American made product—the famous TRIPLE CHAIN WIRE—the wire that foreign papermakers have used so successfully for so many years in making superior light weight, fine writings, bible, cigarette and tissue paper.

You can now get this wire—made by one of the oldest American wire concerns—woven on our own looms by American workmen, but made from the finest grade of imported French wire.

These wires will give you better paper and greater production—at less cost—they outwear any other wires and the first cost is about the same.

Let us tell you about this exceptionally fine Fourdrinier wire. We may be able to tell you something you don't know about wires.

Constitution and By-Laws of T. A. P. P. I.

Revised Articles of Organization of the Technical Association of the Pulp and Paper Industry, Adopted at the Ninth Annual Meeting in New York, April 8, 1924

Article I

NAME

This Association shall be called the Technical Association of the Pulp and Paper Industry.

Article II

OBJECTS

The objects of the Association shall be:

1. To further the application of the sciences in the pulp and paper industry.
2. To promote study, investigation and research of pulp and papermaking processes, their raw materials and products.
3. To promote education in the art and science of papermaking.
4. To provide means for the interchange of ideas among its members on scientific and technical matters pertaining to the industry.
5. To arrange for the collection of information relating to the industry and for the presentation, discussion and publication of papers and contributions submitted by its members.
6. To promote the professional, social and economic welfare of its members.

Article III

MEMBERSHIP

Membership of the Association shall consist of Members, Associate Members, Junior Members and Corporate Members.

1. Members only shall be entitled to vote and hold office except that Corporate Members shall have the privilege of designating one representative to vote in their name.

Associate Members and Junior Members are entitled to all the privileges of membership except voting and holding office.

2. A Member shall have a technical education or its equivalent and shall have been engaged in the manufacture of pulp or paper or in work of a technical character in industries or institutions related to the pulp and paper industry for at least ten years, which period may include the term of instruction in a technical school of recognized standing. He shall also have held a position of responsibility for at least three years. (Note: Related industries—manufacture of pulp, paper and power equipment, chemicals and general supplies for the pulp and paper industry; design and construction of pulp and paper mills; consulting chemists and engineers; pulp and paper mill cost accounting, plant management, forestry and vocational education. Related institutions—government bureaus and departments; technical schools; engineering, chemical and technical societies.)

3. An Associate Member shall have been actively engaged in the pulp and paper industry or in industries or institutions related thereto for at least five years, which period may include the term of instruction at a technical school of recognized standing. He shall also have held a responsible position for at least one year.

4. A Junior Member shall be under twenty-five years of age and shall have such technical education as will fit him for a subordinate position in the pulp and paper industry.

5. A Corporate Member shall be a firm or corporation actively engaged in the manufacture of pulp or paper, which endorses the policy and activities of the Association.

6. Applications: A candidate for admission to the Association shall make application on the form approved by the Executive Committee, upon which he shall give in detail a complete statement of his training and experience, with his agreement that if elected he will conform to the Articles of Organization of the Association. He shall give as references three members of the Association, to two of whom he is personally known. An application for transfer in grade shall be made in the same way as for admission to membership.

7. Admission or Transfer: All applications for membership and transfer in grade, with the reports of the references and the results of investigation, shall be presented to the Executive Committee which shall act thereon, assigning the applicant to the grade to which, in their judgment, his qualifications entitle him. Junior Members who have been in this class for five years, or shall have attained the age of 25 years and be otherwise qualified, shall be automatically transferred to Associate Membership.

8. Election: Six affirmative votes of the Executive Committee are necessary for election. Each person admitted to membership shall pay the initiation fee and dues for the grade to which he is assigned before his election is completed.

9. Initiation Fees and Dues: Initiation fees and annual dues for each grade shall be as follows:

Initiation Fee:

Members, Associate Members and Junior Members	$5.00
For Corporate Members there is no initiation fee.	

Annual Dues:

Corporate Members	$100.00
Members	15.00
Associate Members	15.00
Junior Members	5.00

10. Payment of Dues: Annual dues shall be payable in advance and shall become due on the first of January of each year at which time a bill therefor shall be mailed to each member, except that members elected after the thirtieth of June shall be liable for one-half of the annual dues for the year.

On the first of April members whose dues are three months in arrears shall be placed on the suspended list and carried as such until the first of July when, if still unpaid, they shall be dropped for non-payment of dues, due notice of the impending action having been given. During the period of suspension members shall receive no service but may resign in good standing by payment of one-half year's dues.

11. Reinstatement: Members dropped for non-payment of dues may be reinstated by vote of the Executive Committee on payment of the dues covering the year during which they were dropped.

Article IV

OFFICERS

The officers of the Association shall be a President, Vice President and Secretary-Treasurer, elected at the Annual Meeting for one year.

1. In event of the absence or inability of the President to serve, the Vice President, or in the absence of both, a president *pro tempore* shall preside at meetings of the Association.

2. The President shall be the representative of the Association on the Executive Council of the American Paper and Pulp Association.

3. The President shall present at each Annual Meeting an address discussing such subjects as may to him seem suitable to the occasion.

4. The Secretary-Treasurer shall receive an annual salary and in addition thereto the amount of his necessary expenses incident to the performance of his duties.

5. The Secretary-Treasurer shall keep fair and correct minutes of the proceedings of the general sessions and carefully preserve on file all reports, essays and papers of every description presented to the Association, and shall be charged with the necessary correspondence of the organization, and with editing, publishing and distributing of the reports and papers of the Association under the direction of the Executive Committee.

6. The Secretary-Treasurer shall notify the chairman of each standing and special committee of his appointment, giving him a list of his associates and stating the business upon which the committee is to act.

He shall notify the members two weeks in advance of the time and place of meetings.

7. The Secretary-Treasurer shall present an audited statement of the accounts at each Annual Meeting.

Article V

EXECUTIVE COMMITTEE

The President, Vice President and Secretary-Treasurer, *ex-officio*, with five members shall constitute the Executive Committee of the Association.

(The present (1915) Executive Committee shall serve for one year, at the end of which time five members shall be elected as follows: Two to serve for one year, two for two years and one for three years, and thereafter members of the Executive Committee shall be elected at the Annual Meeting for the full term of three years.)

1. Vacancies in any office shall be filled by the Executive Committee until the next annual meeting.

2. The Fall Meeting shall be held at on applications for membership as hereinbefore provided and shall have general charge of the affairs of the Association.

Article VI

MEETINGS

Two regular meetings shall be held during the year, the Annual and the Fall Meeting.

STRATFORD COMPANY

160 Cornelison Ave., JERSEY CITY, N. J.

1. The Annual Meeting for the election of officers, presentation of reports and transaction of other business shall be held at the time and place of Annual Meeting of the American Paper and Pulp Association.

2. The Fall Meeting shall be held at such time and place and for such purposes as may be determined by the Executive Committee.

3. Special meetings may be called at the discretion of the Executive Committee.

4. Meetings shall be called in writing and every member shall receive due notice of the proposed program.

5. Thirty Members shall constitute a quorum for the transaction of business at all meetings.

Article VII

COMMITTEES

1. Unless otherwise ordered by a regular meeting, the President, with the advice of the Executive Committee shall appoint all standing committees. The President and the Secretary shall be *ex-officio* members of such committees.

2. Special committees may be provided for by regular or special meetings or by the Executive Committee as occasions warrant.

Article VIII

DISCIPLINE

Any member may be expelled or any officer removed for improper conduct but no person shall be expelled or removed from office except by a two-thirds vote of all the Members present at the meeting at which the matter is considered and after he shall have been given an opportunity to be heard in his own defense.

Article IX

HONORABLE MENTION

To mark the technical development of pulp and paper manufacturing the Executive Committee may, by unanimous vote, award Honorable Mention to those whose achievements have definitely contributed to the progress of the industry.

1. The awards shall not exceed two for each year.

2. Announcement of awards shall be made at the Annual Meeting with a statement of the contributions made by the recipients and their relation to the progress of the industry.

3. Honorable Mention need not be confined to the membership of the Association.

Article X

SECTIONS

To carry out more effectively the aims of the Association, Sections may be established wherever there are enough members to form an adequate local organization.

1. The formation of such Sections may be authorized by the Executive Committee upon the written petition of five or more members. A Section shall be known as the...(name of place)...Section of the Technical Association of the Pulp and Paper Industry.

2. The officers of each Section shall consist of a chairman and a secretary and such others as may be necessary.

3. Any Section may, subject to the approval of the Executive Committee, adopt for its own government such by-laws as it may find expedient, including the qualifications for associate members of the Section, provided that no part thereof shall conflict with the Articles of Organization of the Association.

4. No money from the general funds of the Association shall be appropriated or used for the expenses of a Section.

5. The Executive Committee shall have the right at any time to rescind the authorization of any Section and to terminate its existence.

Article XI

AMENDMENTS

These Articles of Organization may be amended by the vote of two-thirds of the Members present at any regular or special meeting provided that such proposed amendment shall have been offered at the last preceding regular meeting and approved by a majority of the Members in attendance at such meeting and provided further that at least two weeks prior to the meeting at which the amendment is adopted written notice of the action of the previous meeting shall have been given to every Member of the organization.

Comparison of Tensile Testers

By COLEMAN J. COSTELLO*

AN attempt has been made to compare the relative values of several commercial machines in common use for determining the tensile strength of paper. Because of the great variety of such machines, it was thought advisable to limit the number of those considered to four which would be representative of the many types on the market. Two of these machines are of the inclinable balance type, operated on the deadweight principle, and best suited to test strips of paper approximately 4 inches long, and 1 inch wide or 15 millimeters wide. A third machine was hand-propelled, and tested inch-wide strips of paper 4 inches long. This machine registered the breaking strain on a gage. The fourth machine was best suited to test strips of paper approximately 2 inches long and 15 millimeters wide. This machine is operated by a hand-lever which is connected with a set of springs and the strips are placed in a horizontal position.

Twelve lots of paper were selected for testing, these being representative of a wide range of types. The average of 10 tests was taken to determine the tensile strength of each sample and duplicate tests were made in each case. The specimens were tested in both directions of the sheet, more than 1900 tests in all being made. The strips for testing were all cut to the size best adapted to each particular machine, as given above.

Considering the amount of variation between individual tests made on the sample, two of the machines gave results superior to those obtained with the other two. All four machines gave good results as regards comparison of averages obtained for duplicate tests on the same machine. That is, as regards duplicate determinations made on the same machine, very close check results may be obtained. When the average results obtained by the different machines are compared, however, there is quite a wide variation. This is due, no doubt, not only to difference in size of the paper strips tested and the rate of application of the load. Apparently tensile testers of different types cannot be used for strictly comparative results and therefore, in reporting results of tensile tests, the kind of machine used should be specified.

Report of the Soda Pulp Committee

By G. K. SPENCE

Chairman

DURING the past year the Soda Pulp Committee has devoted considerable time and study to a number of important problems relating to the industry.

The problems referred to are:

1. "Late developments in washing brown stock with continuous filters," which also includes the study of brown stock washing with centrifuges or in any other way.
2. "Evaporation of Spent Liquor."
3. "Deterioration of Color of Soda Pulp on Ageing."
4. "Reduction of Bleach Cost by Chemical Control."
5. "Chemistry of the Alkaline Wood Process."
6. "Various methods of reclaiming Lime from causticizing process in soda and sulphate pulp mills.

These are all important problems in the manufacture of soda and sulphate pulp. At our sectional meeting Wednesday afternoon, all of these subjects will be discussed and if time will permit, other questions will be taken up; such as disposal of black ash, continuous causticizing, destructive distillation of spent liquor and extraction of pine chips before cooking.

Owing to the inability to secure a chairman for the Sulphate Committee the sectional meeting, as in the past two years, will be a joint meeting to discuss soda and sulphate pulp problems, and all subjects taken up will be common to both processes.

Due to the discussions and work of the Soda Pulp Committee during the past few years, a number of mills have made material improvement in their operating conditions, especially in the process of causticizing, cooking, washing and bleaching. During the next year your committee will have collected and studied enough data to give definite recommendations regarding washing brown stock, and methods for disposal of lime sludge from soda and sulphate pulp mills.

Future work as planned will also cover disposal of black ash and improved methods of cooking and bleaching, as well as developments in destructive distillation of spent liquor.

Paper Testing Committee Report

By F. A. CURTIS
Chairman

I. Program

A DEFINITE plan or program of work was arranged at the beginning of the year and the members of the committee asked to take part as follows:

1. *Microscopic Analysis H. N. Lee*
Continue work of previous year and attempt to finish the corporative investigation and propose methods for adoption.

2. *Greaseproof Papers—H. A. Smith*
Develop suitable methods of testing greaseproof paper.

3. *Papers used in the electrical industry—A. L. Allen and A. T. Randall*
Develop special tests for various insulating and cable wrapping purposes.

4. *Coarse Boards—A. R. Harvey and M. C. Walsh*
Develop tests that are suitable for the various types of coarse boards, with especial reference to box board.

II. Microscopic Analysis

The report of H. N. Lee appeared in the *Paper Trade Journal* under date of November 22, 1923, under the title of "Microscopical Analysis of Paper by Eighteen Investigators using Different Methods." As a result of this investigation, two methods are proposed to the Association for their consideration.

On the publication of the report by H. N. Lee, a mathematical study was made of the results by E. A. Bergholtz of the American Telephone & Telegraph Company and his paper is preprinted under the title "Comparison of the Various Methods Used in Determining the Fibre Content of Paper."

A method for differentiating between soda and sulphate pulp in paper has been developed by E. Parke Cameron of the Forest Products Laboratory of Canada and has been tested by several laboratories. Reports of his method are very favorable. The method is presented in preprinted form.

III. Grease Proof Paper

The report of H. A. Smith is presented in preprinted form under the title of "The Turpentine Penetration Test for Grease Proof Paper." Considerable work has been involved in the development of this test and the co-operating laboratories are to be congratulated on the results of their efforts. It is believed that this proposed method will be of considerable value to the industry.

IV. Papers Used in the Electrical Industry

Reports have been prepared by A. T. Randall and A. L. Allen, working independently, of qualities that are necessary for paper used in this industry and this work is to be continued and tests developed to determine these special qualities.

Contract has been maintained with H. H. Brown, a member of a sub-committee on Unimpregnated Paper of Committee D-9 on Insulating Materials of the American Society for Testing Materials. The physical and chemical tests proposed by this sub-committee seem somewhat more rigid than necessary for ordinary mill laboratory work. They include the usual tests with the addition of the following: Porosity, Apparent density, Acidity and Heat endurance.

The tests desired on insulating paper are as follows:

Moisture, thickness, tensile strength, tearing strength, bursting strength, folding, porosity, absorption, water rise, apparent density, fiber analysis, Metallic particles, heat endurance, acidity, ash, flexibility, dielectric strength and size.

Fish Paper

Of course, different insulating paper to be used for different applications should have different qualities. However, no one paper would have to be tested for all of the above named qualities.

For example, thickness, tearing strength, dielectric strength, and flexibility, also porosity are required on thin fish paper. Fish paper is a cotton paper treated with either zinc chloride or sulphuric acid.

Condenser Paper

On a condenser tissue our tests would be confined to fibre, thickness, and porosity.

Rope Paper

On rope paper we would usually test for metallic particles, tearing strength porosity, absorption and thickness.

The Sub Committee on paper, of Committee D-9 of the A. S. T. M. has been working on a specification for tests of paper and has just about completed their tentative specification. At present they are trying out four methods including the Technical Association of the Pulp and Paper Industry for adopacidity. They claim that their preliminary data revealed the inadequacy of the Technical Association of the Pulp and Paper Industry method of determining acidity of insulating papers. They say that the three re-

L JUSNAN
SULPHITE PULP

L. J. II Crown

L. J. Knotter

Agents:—
PRICE & PIERCE, LTD.
17 East 42nd St.
New York

maining methods will be revised for further work on four samples to be tested by nine laboratories. They are collecting data on three machines for testing tensile strength with the view of describing a method that will permit the use of both machines. They are also collecting data on two instruments for the testing of porosity or air permeability, to ascertain the uniformity of results obtained with these two instruments. They are considering the two methods for fiber analysis now up to the Technical Association of the Pulp and Paper Indusary for adoption, of course, that the Technical Association of the Pulp and Paper Industry for adopmethods.

Practically all of the members of the A. S. T. M. Committee are users of electrical insulating paper and not manufacturers. I would think it very desirable for the manufacturers to seriously consider all of these tests named above and which will also be named in the A. S. T. M. specification.

V. Coarse Boards

Although a detailed report of this part of the program is not available, it is planned to continue the project. There are few, if any, really satisfactory tests for coarse boards. Although a large portion of this product used does not require any special tests, the very great tonnage and the large percentage of total paper made warrants an investigation as to test methods. A report is expected in the near future from A. R. Harvey and M. C. Walsh.

Through the courtesy of B. W. Scribner, a number of abstracts of reports from the Paper Section of the Bureau of Standards have been made available for this meeting as follows:

1. The Detection of Animal Size in Surface Sized Papers by F. T. Carson.
2. Effect of the Weight of the Gauge Needle of the Mullen Paper Tester upon the Bursting Strength Test by C. J. Costello.
3. An Analysis of the Strength of Paper by F. T. Carson.
4. Comparison of Tensile Tester by Coleman J. Costello.
5. A Measure of the Color Characteristics of White Paper by R. E. Lofton.

VI. Conclusion

Continued application to the development of paper testing methods is very desirable. It is hoped that the members of the Association will continue to lend their support to this work.

Heat, Light and Power Committee

DURING the year the committee has not been called upon to do any intensive investigation. Considerable information has been sent out to some of the members on specific problems such as illumination and power requirements. The committee undertook to prepare for the Annual Meeting a report on Power Losses but its investigations have not advanced sufficiently to report at this time.

Another subject of interest was the use of accumulators, and steam turbines for paper and pulp mills and this subject is under discussion by the committee now and no doubt something will be offered at the fall meeting.

The third subject is a moisture meter for automatically registering and indicating the amount of water in the sheet as it passes over the machine. We hope to have something to report along this line at the next meeting as the trial installation is now being put in.

The committee will undoubtedly confine its efforts for the coming twelve months to the study of the following subjects: Use of steam accumulators, heat losses, power losses, moisture meter.

In addition to the foregoing if any member has any suggestions to offer, the committee would welcome them.

Alexander's Stain

By E. PARKE CAMERON*

DIFFERENTIATION between Sulphite and Soda Wood Pulps. The stain consists of three solutions:—

I. 0.2 g. Congo red
   300 cc. Distilled water
II. 100 g. Calcium nitrate
   50 cc. Distilled water
III. Herzberg's chlor zinc iodide stain made up as follows:—
   (A) 20 g. Zinc chloride
      10 cc. Water
   (B) 2.1 g. Potassium iodide
      0.1 g. Iodide
      5 cc. Water

Add (B) to (A) and prepare in usual way.

Manipulation:—

The sample to be tested is first stained with 2 drops of the Congo red solution for 1 minute after which the excess dye is carefully blotted off and the sample allowed to dry.

The dry stained sample is then immersed in 3 drops of the Calcium Nitrate solution and then allowed to remain for one minute. At the end of this time one drop of the Herzberg stain is added, the whole quickly and thoroughly mixed and the cover glass placed on.

The slide may be examined immediately but there seems to be a slightly stronger tone to the colors if it is let stand for three or four minutes before examination. The sulphite should be an evenly stained *pink* and the soda a *deep blue*. The vessels in a hardwood soda pulp are the hardest portion to stain properly, and if these give a good color closely resembling that of the soda fiber the stain is working very well.

PULP AND PAPER IN LATVIA

New Nation Carved Out of Russia is Developing Increased Export Trade With Other Countries

LATVIA, one of the new nations of Northeastern Europe, of which Riga is the capital and Dorpat the University city, has a compact pulp and paper industry. Eighteen mills are listed in the 1923 edition of the Paper Makers' Directory of All Nations. Some of the more important plants are as follows:

Baltic Cellulose Works, Ltd., Schlock near Riga, manufacturers of sulphite and kraft pulp to the extent of 140 tons, and of poster, parchment and wrapping papers 350 tons weekly, with five machines in operation.

Baltic Paper and Pasteboard Mills, Ltd., Riga. Brown packings and printings.

Bruns & Co., Ed., Riga. Mill at Stintsee. Writings; 2 machines making 100 tons weekly.

Heflinger & Co., A., Riga. Sulphite pulp.

Knopp, G., Riga. Various papers and woodpulp. One machine and two vats making fifty tons of paper and fifty tons of board weekly.

Litener Paper Mill Company, Ltd., via Vex-Gulbene and Riga.

Semenows Paper Mills, Rappin, Werro. Blottings, wrapping, album and photographic paper. Two machines making 100 tons a week.

According to the *Scandinavian Weekly* the Latvian paper industry is developing particularly favorably, and, in addition to satisfying home consumption, exports to other countries are on the increase, recent exports having included Great Britain, Australia, the United States of America and other countries. The necessary raw materials, such as wood, woodpulp, rags, etc., are all obtainable locally, and the industry derives a great advantage from the suitability of the local water, which in most instances is used in its natural state.

Pulpwood Shipments Less

Shipments of pulpwood from the north wood and from Canada which the Northern Paper Mills, of Green Bay, have been receiving regularly since last fall, are beginning to diminish as the logging season comes to a close. The Northern's requirements are about 35,000 cords of pulp wood every year and approximately 70 per cent of this arrives during a 90 day period which usually begins about Jan. 1.

Small shippers of pulpwood, farmers and settlers who manage to cut a carload or two a year, often ship to the mills during the summer so there are occasional shipments straggling in all through the year. A comparatively small amount of pulpwood is obtained from Washington Island, off Door County in the Lake Michigan, but this is brought to the Northern by water.

From Appleton come reports that the receipts of pulpwood continue with no letup and expectations are shipments will be heavy for two or three more weeks. The receipts of wood for February and March at Appleton surpassed previous records, a large part of the Appleton business being with the Interlake Pulp and Paper Company, whose yards are stocked up as they have not been for some time.

A Big Job Ahead

Summary of a Talk Before the Woodlands Section of Paper and Pulp Association

By SAMUEL T. DANA

THE Northeastern Forest Experiment Station is a very young organization with a very big job. It was established during the summer of 1923, with headquarters at Amherst, Mass., for the purpose of doing in forestry the same sort of thing that the agricultural experiment stations have been doing in agriculture. Its main task is, therefore, nothing less than to determine the fundamental facts and principles on which sound forest practice must be based. Studies having to do with protection of the forests from fire, insects, and disease, with methods of cutting, with planting and nursery practice, with the measurement of existing stands, and the prediction of future yields, and with other phases of forest management, all come within its scope. Problems in wood utilization are, however, not included, and will continue to be handled by the Forest Products Laboratory at Madison, Wisconsin.

The field covered by the Forest Experiment Station includes the six New England states and New York, a region with a wide variety of forest types and with a total forest area of approximately forty million acres. With an annual budget of less than $25,000 it is clear that it is a physical impossibility for the station to undertake more than a very few of the large number of forest problems of urgent importance in the region. In selecting these, an effort is being made to concentrate attention on projects of outstanding importance on which comparatively little or no work has previously been done by other agencies.

Much of the station's work will necessarily have to do with problems in which the pulp and paper industry is vitally interested. This is true both because of the important place occupied by the industry and because of the fact that the bulk of the investigative work so far done in the region has been with white pine rather than with spruce and other pulpwood trees. More than half of the pulp mills of the country are located within the region covered by the Experiment Station. Yet, within this region the forest resources on which the mills are dependent for their supply of raw material are deteriorating steadily both in quantity and quality. One of the tasks of the Experiment Station is to determine the facts which will make it possible to reverse this situation and to increase forest production. It is a task in which the industry is necessarily interested, since its very existence is dependent on an adequate supply of raw material. More effective wood utilization will help, but increased production is equally essential to furnish the wood to be conserved.

The first study undertaken by the experiment station was that of the growth and yield of spruce and balsam fir. Dependable figures are now wholly lacking as to yields to be expected from these species at different ages and under different conditions. Yet, no company is in a position to make intelligent plans for the future unless it knows what growth is taking place on its holdings and what future yields may be expected at any given period after different methods of cutting. Only with the help of definite figures on these points can it answer such questions as to whether or not it is overcutting its lands, what acreage it must have to meet its needs, and when and at what cost merchantable material can be secured from plantations.

Closely allied with this investigation are studies of volume tables for pulpwood species and of the kind and amount of reproduction that may be expected as a result of different methods of cutting under the widely varying conditions of stand, soil, topography, and other factors found in the spruce forests of the northeast. Since volume tables are the basis for all estimates both of present stands and future growth, it is essential that they be as dependable

as possible. A new method for the preparation of volume tables is being developed which it is hoped will go far toward putting forest measurements on a thoroughly sound and reliable basis. Intensive studies of the results of various methods of cutting are equally essential to give the timberland owner the facts needed as a basis for adopting the methods that will give him the kind of natural reproduction both as to species and amounts that he desires.

Aside from specific studies, an important result of the establishment of the Northeastern Forest Experiment Station has been the organization of a Forest Research Council. This is a body composed of seventeen men appointed by the Secretary of Agriculture who are already engaged in or interested in the results of forest research. Its functions is to act in an advisory capacity not only to the Experiment Station but also to other forest research agencies. The Council will not itself conduct any research, but will aim rather to encourage and guide research on the part of others without in any way attempting to interfere with their complete freedom of action. While its recommendations will not be mandatory, they will undoubtedly command respect, and should be effective in securing the adoption of a more comprehensive and better coordinated program of forest research than now exists. It should also be influential in calling attention to the results of investigations and in getting these results put into actual practice.

The station looks forward to conducting a considerable part of its work in the closest possible coordination with the pulp and paper industry. Representatives of the industry are included in the Council, one of the members of which is Chairman of the Sub-Committee for the Northeastern Station appointed by the Advisory Committee of the pulp and paper industry to the Department of Agriculture. Sub-stations will also in all probability be located in parts of the region in which the industry is particularly interested. Suggestions as to desirable sites for sub-stations as well as to problems in need of investigation and as to any other activities of the station will be gladly received.

Conditions in the Paper Industry

President Stokes Says 1923 Set a New Standard and that Present Conditions Are Governed by It

FOR a long time to come, in the opinion of many men conversant with conditions in the paper industry and with general business conditions, the calendar year of 1923 will be regarded as a basic year, with which to compare conditions in the years to come.

The establishment of a new basis for comparison may have been responsible for some of the disconcerting conditions that have been experienced during the past year, but instead of discontent with the state of business, the paper industry should look forward with optimism based on the fact that at least the business of the nation and of this industry in particular has reached a stable basis.

Prices Might be Better

It must be recognized that while prices have not been as satisfactory as the mills may have hoped, the production for 1923 was only a few thousand tons under the previous high production record of the industry. As has been said before in these columns, no business can be considered unprosperous in a year when its production totals have been practically of record-breaking volume.

Years of big profits and heavy demand may be pleasant to contemplate, but any such over-prosperity must be followed by the swing of the pendulum of business to a period of depression, and the period of normal activity is that in which, and in which only, the business man can dispassionately study his business status.

Conditions in 1914 Must be Forgotten

It is true that there are some uncertain elements existing at this time. First, the economists say the nation is facing a period of slowly decreasing prices, and this has had the reaction in the paper industry of a large volume of short-order business, and not a volume of large orders and heavy stocking of warehouses. This tendency has persisted in the face of increasing prices for raw materials for the finer papers, and an unchanged labor situation. It is questioned by many experts whether the view of the economists applies truly to the paper industry with its slowly but surely diminishing reserve of raw materials. Colonel Greeley, chief of the United States Forest Service, in a recent magazine article, prophesies the day when paper consumption will be diminished with the higher cost of raw material, due in turn to the diminishing acreage of usable forest. The great fallacy today is to consider present prices in comparison with those that obtained in 1914, as if that were a basic year. Prices and the conditions under which they existed in 1914 are past and gone. The new basic year for prices and the present conditions, which govern prices and which will long continue is 1923. Our gold reserve, European conditions; labor supply, our industrial expansion and domestic consumption all make 1923 a normal year for price comparison for some time to come and make any comparison with 1914 as unsound as it is dangerously misleading. Business must forget 1914 and think in terms of 1923.

Business Injuriously Affected by Politics

The second cause of uncertainty is the political situation, not so much the fact that this is a presidential year, but the playing at politics at Washington on tax and other matters affecting business, and the tendency of the legislature to sacrifice business and prosperity to partisan advantage.

The third difficulty is the importation of foreign papers, not in sufficient volume to disturb the market, but under such condition of unfair competition as psychologically to upset the market in which relatively small importations are pyramided by brokers into apparently large shipments.

High Production in 1923

In the face of such factors, it is truly remarkable that January and February paper production held up to the high record figures of a year ago, and estimates of car requirements for the first six months of the year by the big paper companies, made to the railroads, falling off from the previous high record of the first half of 1923. It is to be noted that in 1923, the first six months of business was above that for any similar period in the history of the industry. Only an unexpected change in conditions in the latter half of the year prevented 1923 from being a year of record breaking production in all grades.

Outlook for 1924 is Encouraging

January production as reported to the American Paper and Pulp Association was 17 percent in excess of December, and February, following such a high production month, only fell off 3 percent from January. All grades, even those showing the smallest degree of prosperity, are reporting high productions.

It is proper to record also that while the average was 3 percent less than in January, newsprint with its great vol-

PRESIDENT STOKES
Reelected Head of American Paper and Pulp Association

ume of production, showed a falling off of 9 percent, indicating that other grades had an actual increase in February over January to compensate for this falling off.

In general, therefore, it can be stated that the paper industry, can properly assume an attitude of confidence that present conditions, if there is any material change, will only change for the better with the steady increase of the nation's consumption of paper.

* * *

Interest in Convention

A great deal of interest is shown in the annual convention of the Pulp and Paper Makers Association which will be held in May in Middletown, Ohio. Practically all the superintendents from the Michigan Division plan to be present. Emil Yonke, of the Standard Paper Co. plans on driving through. Jacob Parent, secretary of the Michigan Division, drives first to Middletown for the convention, then goes to the Mammoth Cave, Kentucky. Jake plans on being away for three weeks.

* * *

Takes New Position

Charles Keelan, formerly superintendent of the Superior Division of the Bryant Paper Co., has accepted the position as superintendent of the LaSalle Paper Company's new plant at South Bend. This is still in process of erection. This mill has one Fourdrinier, and a high grade kraft is to be manufactured here.

* * *

Wheeler Takes New Position

James Wheeler, of the Sales Department of the Allied Paper Mills has accepted a position with the Western Paper Makers Chemical Co. leaving Kalamazoo and going to their Milwaukee office. Robert Van Peenan, of the Monarch Division of the Allied goes over to the sales department, taking Mr. Wheeler's place. George Weston, a recent graduate of the University of Michigan, goes to the Monarch Division.

Drying and Conditioning Gummed Paper

By J. O. ROSS*

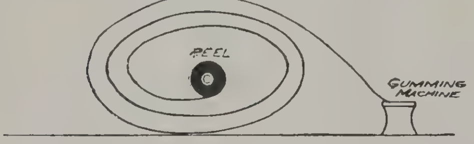
Chairman

DISCUSSING the proper kind of gummed paper drier is very much like discussing the proper type of house that a man should build.

Nearly every gummed paper manufacturer has his own ideas as to how the drier should be built and even has his own ideas as to the results that should be accomplished. There is probably no branch of the paper industry where there has been so little standardization as in the drying. Usually each man believes that his own particular drier is the best, although we encountered two cases where each man thought that the other man's system was better than his own. We suggested that they swap driers and find out the flaws in the other system at first-hand. I fully expect that many gummed paper men are going to disagree with many things in this paper. I feel that no one is in a position to say just what system should be used and can only present some of the different types and some of their advantages and disadvantages and depend on a discussion among the various interested parties to establish some sort of common ground.

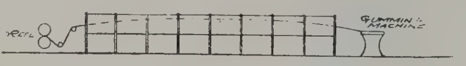
Two Classes of Gummed Paper Driers

In general gummed paper driers are of two different classes. First the driers which hold the paper under tension, and second those which dry the paper without tension. Perhaps the best known type of the first class is the so-called "Crowell Drier." This consists of a machine which takes the paper through the gumming machine and carries it over a spiral finally winding up in the center of the spiral somewhat as shown on the sketch. The entire Crowell machine is enclosed and the paper is dried by hot air directed on the surface of the sheet. The enclosure prevents the heat escaping into the work room and keeps it in contact with the sheet. There are many adaptations of the Crowell machine. In some cases the paper is carried over a large drum instead of a scroll. This drum may be enclosed, with steam admitted in the interior operating very much like a paper machine drier and the heat is transmitted through the paper to dry the gum on the surface. This is improved by blowing a blast of hot air on the gummed surface so that all the heat for evaporating the moisture does not have to go through the sheet. This works fairly well if speeds are maintained constant, if the gumming mixture is always the same, if there are no stops and if the paper must not dry too much. However, it is a good deal like passing a wet surface through a flame. It it passes through through rapidly enough no injury results due to the cooling effect by the evaporation of the moisture. If the material is stopped, however, and becomes dry it immediately burns up. In general this cylinder method has not been very satisfactory..



CROWELL DRYER
TENSION DRYER

A better scheme is to use a skeleton wheel or slatted drum, carry the paper around the circumferences of it and blow hot air on the outside of the gummed surface. Hot air is also often introduced inside the wheel so as to raise the temperature of the paper which assists the drying. In some cases two drums are used, the paper passing first over one then an idler roll and finally over the second drum in such a way that the gummed surface is outside.



TENSION DRYER
STRAIGHT TYPE WALDRON DRYER

Another system of drying where the paper is carried under tension is to carry it through flat after leaving the gumming machine being carried either on a belt or on rollers. In this case there is usually a combination of heating methods. Hot air is blown in at one end of the enclosed drier and taken out at the other and in addition to this steam coils are placed above the gummed surface so that the radiated heat and also the radiant heat helps to dry the gum.

The machines so far described operate with the paper under tension, that is they hold the sheet and in that way prevent undue curling of the paper, which is one of the very serious difficulties in drying gummed paper. Gummed paper will curl on the edges to an extent never encountered in coated paper or wall paper. If a sheet of paper is gummed and laid on a flat table, in an ordinary atmosphere it will often curl so much as to form a tube. This tendency has led to installing drum driers or roller driers crowned in the middle so that the paper passes through the drier in an arched form which has a tendency to stop the edges curling. Other means have been tried of wetting the underside of the sheet on the edges so that the edge of the paper is wet not only where the gum is applied but on the underside so that the shrinkage of the two sides is more nearly the same, eliminating part of the curling. The great trouble with all means of carrying the paper under tension is the very short time allowed for drying.

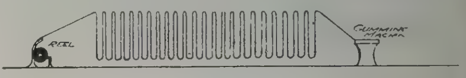
The Factors of Time and Heat

To dry a piece of gummed paper, two elements enter. The first is the time allowed for drying, and the second is the amount of heat or drying air that must be supplied. It will be very evident that the shorter the time allowed for drying, the greater the temperature and the more air that must be used. This brings in a complication. If a sheet of gummed paper is put through too high a temperature it has an injurious effect on the gum after it has reached a certain stage in the drying process very much like a sheet of coated paper, which can be subjected to a considerable degree of heat when the paper is wet. This is done in the case of double coaters by using a very high temperautre on the floater. No injurious effect is caused due to the cooling effect produced by evaporation. When the paper has been more than half dried, this high temperature is decidedly objectionable owing to the danger of overdrying. It is impossible to design or regulate a high temperature drier that will dry paper very rapidly until it reaches the proper percentage of moisture and which will stop at that desired point.

All paper contains a fixed percentage of moisture which is dependent entirely on the condition of the atmosphere surrounding the paper. If the paper is exposed to a low temperature and high humidity it will continue to contain a high percentage of moisture and will contain that regardless of how long it is exposed to this atmosphere. It the atmosphere is raised in temperature or decreased in humidity the paper will immediately dry out until it again reaches a balance, dependent entirely on the temperature and humidity of the surrounding air. It will then stay at that point until the atmosphere is again changed to a higher temperature and lower moisture content in which case it will immediately dry out the paper again still further.

The Ideal Drying System

It will therefore be evident that the ideal drying system as far as quality is concerned would be to surround the paper with an atmosphere which would be exactly correct in temperature and humidity to produce paper containing the proper percentage of moisture. A temperature of 70 deg. F. and about 60 per cent humidity, which is usual in an ordinary office or warehouse, will produce paper with about 6 per cent moisture content. Therefore if this paper could be dried during the manufacture with a temperature of 70 deg. F. and 60 per cent it would gradually give up moisture until it reached 6 per cent and would never go below that point regardless of how long it remained in the drier.



FESTOON DRYER
NO TENSION

The flaw in this kind of system would be that the paper would dry very slowly. When the paper reached 10 per cent moisture content it would become very slow drying and by the time it reached 7 per cent it would be so slow that it would probably take as long to drop from 7 to 6 per cent as it did to drop from 40 to per cent. Therefore it is not practical to install a drying system of that kind. With a high temperature drier, however, which is necessary if paper is to be dried fast, it means that if the paper is allowed to remain in that atmosphere it will be practically bone dry. The more time that is given to the drying, the less risk there is of overdrying the sheet so that the time element, as it is called, has a very important bearing on the quality of the sheet.

All tension machines have this inherent defect. If gummed paper is being run through at a speed of 100 ft. per minute and carried over a steam drum 30 ft. in diameter, which would be out of the question, it woul still have only 1 minute for drying. That is the reason that the Crowell drier uses the spiral. It operates about the same as if using a large number of cylinders but instead of mounting them one after the other they mount them one inside the other so as to save space.

The drier which carries the paper through flat either on rollers or belts also has the same trouble. If we are to allow 1 minute for drying and wanted to run 100 ft. per minute, it would mean a drier 100 ft. long. Experiments have been made and some driers have been built to carry the paper back and forth several times so as to cut down the total length.

---

* Member T.A.P.P.I. Pres. J. O. Ross Eng. Corp., New York City.

Ohio Notes

PROMINENT "Paper" men in Cleveland have returned from the Paper Convention, held in New York—all claiming that the Convention was the "very best ever." Mr. White of the Union Paper Company reports that the displays were elaborate as well as instructing,—The results of the business meeting which was held April 10, indicated that the committees which rendered their annual reports concerning four groups of the Paper Industry had studied the situation well. A recent addition to the three former groups is "Paper Board Manufacturers." The Board manufacturers are working in collaboration with the American Paper and Pulp Association.

* * *

Cleveland is proud of their "Paper Association". This is an organization comprised of representatives of all the leading paper jobbers and dealers of the city, who meet once each week to discuss the paper situation in the city, and to compromise on various prices —this to eliminate "Cutthroat" price reductions. The group meets in the offices of the firms represented. Mr. Grossman of the firm Merchants Paper Co. was the founder of the organization—our hats off to him!

* * *

Many people feared that the recent flood in the vicinity of Dayton would cause damage to the many mills around that territory, but their fears were unfounded—all the mills, with the exception of one in Miamisburg which suffered a small loss, escaped damage.

* * *

The Continental Paper Bag Corporation is featuring grocers' bags, wrapping, toilet and tissue paper this week. The display at the Paper Convention in New York was a decided success.

* * *

Manufacturers to Back Paper Simplification

Members of the American Paper and Pulp Association, by unanimous action, have voted to back "to the limit" and to make "effective in the shortest possible time" the simplification of paper to eight basic sizes and weights recommended by the Committee on Simplification of Paper Sizes, it was announced today by William A. Durgin, chief of the Division of Simplified Practice, Department of Commerce. Mr. Durgin has been attending the convention of the Association in the interests of a simplification movement which has been under way since 1921, when it was first undertaken at the Bureau of Standards. Approximately 30 leaders in the industry were represented.

The National Advertisers Association reported at the meeting that within two weeks 189 of 280 members circularized in regard to the support of the basic paper sizes had pledged their aid, and that 250 would do so. More than 35 per cent of the 300 members of the National Publishers Association, it was announced, had pledged their support to the program. Representatives of paper machinery manufacturers declared that that branch of the paper industry was in accord with any movement which would lessen the variety of paper machinery; while the National Paper Trade Association sent a report that it not only approved the basic sizes, but indorsed the present movement.

Prediction was made that the National Purchasing Agents Association which had indorsed the tentative plans at its last convention would follow the others at its forthcoming meeting in May.

In a short time more than 150 of the 600 members of the National Association of Employing Lithographers have adopted the basic sizes and the Association as a whole is behind the movement, it was reported.

* * *

Would Welcome Mill

Albany, Linn County, Oregon, was recently told that it had one of the best locations in the state of Oregon for the erection of a large paper mill plant. The town would welcome such an industry.

* * *

Start Manufacturing Soon

Fred H. Fuller, superintendent, states that the manufacture of paper will begin about July 1 in the large new plant of the Columbia River Paper Mills which is located at Vancouver, Washington. The installation of the big paper machine at the plant is progressing in a satisfactory manner. The manager of the sulphite plant, John W. Van Alstyne, is supervising the lining of the digesters with fire brick from Pennsylvania.

* * *

Sparks Started Fire

Sparks from the sawdust incinerator of the Columbia River Paper Mills sawmill at Vancouver, Wash., were alleged to have been the cause of a recent fire which gutted the Columbia Bridge Hotel. The building was an old frame structure and the loss including the furniture is placed at approximately $3000.

Causticizing Plant of Penobscot Chemical Fibre Company

By W. D. MOUNT*

BEFORE describing the new causticizing plant at the mill of the Penobscot Chemical Fibre Company, Great Works, Maine, I think it necessary that brief mention be made of one basic factor underlying any continuous process of causticizing, and on which success must be predicted; namely, thorough agitation and boiling.

It has been my experience during a period of twenty-five years' active connection with the manufacturing and technical end of the alkali industry, and from what I have seen of operations in many plants, that with scarcely an exception the weakest link in the batch process is defective agitation and insufficient boiling. Mechanical agitation by means of equipment more or less standardized and common to the great majority of batch operations can lay no claim to 100 percent efficiency—if by efficiency it is understood that we mean the thorough mixing and agitation of the contents of tanks varying in size from 10 to 13 or more feet in diameter, and as many in depth.

Advantage of Continuous Process

A mere enumeration of the advantages of a continuous process such as that installed at Great Works clearly indicate by inference the disadvantages of the batch process displaced. These advantages are as follows:

1. The general advantages characteristic of a continuous method of carrying on any chemical process as compared to an intermittent or batch method of conducting the same process.
2. The continuous process, including a complete lime recovery plant, requires less than two-thirds the floor space required by a batch system of causticization of equal capacity but without lime recovery.
3. A marked reduction in the amount of piping and fittings needed and the entire elimination of the familiar battery of causticizing and settling tanks.
4. A reduction of alkali loss in causticizing to a uniform level of less than one-half of one percent.
5. A reduction in steam consumed to approximately 25 percent of that normally required by the batch system; if exhaust steam at 10 pounds pressure is available, the use of live steam can be completely eliminated.
6. All apparatus and piping in sight and easily accessible.
7. Decreased cost of repairs and maintenance
8. Uniform and positive chemical control of the process which tends to eliminate the factor of the personal equation which so often leads to inefficient operation.
9. A better place for the operatives to work, and a department which can easily be kept in a neat and orderly condition.

It must be distinctly understood that the claims which are made for continuous causticizing have not been based upon any one of these features alone. The advantages which I have mentioned are characteristic of the process as a whole and it has been demonstrated that they cannot be obtained in any other way than through the complete adoption of the continuous system. In other words, it would be impossible to change the batch system either in whole or in part and obtain the results which can be obtained with the continuous system.

Process One of Simplicity

The process is simplicity itself. There is no complicated apparatus or equipment to get out of order. Its maintenance does not add to the burdens of the superintendent nor does its operation require the attention of a corps of skilled chemists. Two men of average intelligence on each shift can handle the entire causticizing plant; if a lime recovery unit is connected with the causticizing operation, three men can look after both.

The special apparatus and equipment required for the process includes the causticizer, decanter, rotary filters, lime slaker, and certain auxiliary equipment such as vacuum pumps, lime and liquor pumps, etc. The causticizer, which is a tower formed of specially constructed rings, is supplied continuously with calcium hydrate and sodium carbonate in the proper proportions by means of pumps. A steady discharge of a mixture of caustic liquor and lime sludge is pumped from the bottom of the causticizer to the decanter whence the clear sodium hydrate flows from the top and the thickened sludge is drawn from the bottom. The operation of both causticizer and decanter is continuous yet the hydrate drawn from the decanter is clear. The sludge is pumped continuously to the filter where it is washed, and discarded, or reburned and reused for causticizing.

The following description of the Penobscot plant was prepared by my brother, J. E. Mount, who supervised the work of installation and the commencement of operations.

This plant was installed to replace a worn out batch system of causticizing, and at the same time effect various economies in operation which could not be obtained with the old system.

The apparatus consists of one causticizing tower, 6 x 34 feet, one decanter with a capacity of 40,041 gallons, two slaking pots for milk of lime, four continuous discharge rotary vacuum filters, 6 x 3 feet, and two duplex exhausters, together with such auxiliary apparatus as lime and liquor pumps, traps, etc.

The capacity required was to be sufficient to supply caustic liquor for a plant making 100 tons of soda pulp daily. The total floor space occupied by the plant as completed is 3750 sq. ft., or about one-fourth the space required by a plant of the same capacity making caustic by the old method. The saving in piping is fully as much as that in floor space.

Tandem-run Filters

The filters are so connected that two are run in tandem, the cake from the first being repulped with water and run over the second. This gives two separate filter units of such capacity that only one unit need be run at a time, the other being held in reserve. At present the cake from the secondary filter is discarded and washed away, but it can be easily used in a recovery plant should one be installed later.

In the operation of the plant, the lime to be used is first slaked in two slaking tanks. The milk of lime should contain from 150 to 200 g.p.l. CaO. When slaked in hot water it averages about 170 deg. fahr. in temperature. The liquor is pumped from the leach cells to two receiving tanks, and is pumped from each of these alternately and continuously to the causticizing tower. When the liquor, from one tank is being pumped to the causticizer the other is being filled from the leach cells. The average temperature of this liquor to the causticizer runs about 135 deg. fahr. From experience we have found that the strength at which the liquor should be held is about 40 dg. Twd., or 230 g.p.l. Na_2CO_3. This liquor is tested regularly and is held at as nearly a constant strength as practicable. The liquor is pumped into the top of the causticizing tower from whence it flows down around a series of mushrooms to the bottom.

Causticizing takes place in the lower third of the tower; the milk of lime is pumped into the third compartment from the bottom at which point it meets the descending carbonate liquor.

Steam and a small amount of air are admitted at the bottom of the tower and rise through the various sections agitating thoroughly the lime and liquor solutions. Before the steam reaches the top, it is completely condensed.

Pumping to the Decanter

The mixtures of caustic liquor and lime sludge is pumped from the bottom of the tower to the decanter, where the sludge settles to the bottom and the clear caustic liquor rises to the top and flows off over a launder to the digester measuring tanks.

We had no means of measuring the amount of steam used by the causticizer, but as all that was admitted to it was through a 2-inch valve one and a quarter turns open at a boiler pressure of 80 lbs., it was comparatively a small amount. I might mention here that the causticizer is completely lagged with magnesia blocks which in turn are covered with a steel jacket.

From Decanter to Primary Filter

The settled lime sludge is taken from the bottom of the decanter at an average temperature of 150 deg. fahr., and a consistency of 24.6 percent solids, and pumped to the primary filter. After passing over this and the secondary filter, the average percent of Na_2CO_3 in the cake for the first one and one-half months of operation was 0.95 percent. During the last month, we brought this average down to 0.72 percent Na_2CO_3, but as we had more or less trouble in getting a steady supply of wash water for the filters during the most of the time, no trouble should be experienced in holding the alkali content in the cake below 0.5 percent Na_2CO_3 when operating conditions become more settled.

The filtrate is pumped from the filters to the decanter where it mixes with the liquor from the causticizer. The average free CaO in the discarded cake from the filters was 3.66 percent. The average moisture content of the cake was 38.8 percent. The average vacuum carried was about 18 inches mercury. The moisture content can be decreased by raising the vacuum and by providing a better supply of hot water. The average thickness of the cake from the filter was about *one inch*.

We endeavored to carry the strength of the liquor from the decanter slightly above that required by the digesters, 8.0 percent NaOH by weight, so that a small amount of doctoring with water could be allowed for each digester cook. The average amount of liquor decanted when running at full capacity, i. e., present capacity of plant, was about 103,056 gallons per diem. This liquor was clear and free from lime and carbon specks. The capacity can easily be doubled should need arise.

Considering the fact that the plant has been running only about two months, that a set of green operators had to be broken in, that necessary adjustments to machinery had to be made, and that operation has been more or less intermittent, the results accomplished approximate those sought for to a marked degree.

What Plant Has Demonstrated

The plant has clearly demonstrated the following benefits:

(1) It has brought about a much better place in which to work, with less piping and fewer pumps to look after.

(2) It will show marked economy in steam consumption which will be reflected in the coal pile.

(3) It has shown a large saving in alkali.

(4) The lime loss is no greater than before.

(5) The causticity is better.

(6) The liquor to the digesters is clearer and better settled.

(7) The lime is delivered from the filters in a form where recovery can be had.

(8) There is a saving in power and in maintenance.

Memb. T.A.P.P.I. Consulting Engineer, Lynchburg, Va.

1. ***The steady production of Bleached Sulphite, year after year, in large tonnage.***
2. ***The control and standardizing of every step in the processes of production, so that a high quality of product may be maintained and improved.***

Short Center Belt Drive

Important Points in the Design of the Lenix Drive—Operation of the Floating Idler—Essentials for Successful Working of Beater Drives

By VIGO SAHMEL, F. L. Smidth & Co., New York

THE short center belt drive and the theories upon which it is based do not now require an elaborate defense. The reason for this is that it has already stood the test of time and the test of results.

I have in mind the record of a short center belt drive in New York City installed June, 1908, and which is still in successful operation after sixteen years of service. Furthermore, a number of drives on the Pacific Coast installed by the writer in 1912. Quite recently, the manager of the plant in which these drives are installed informed me that they have been in operation twenty-four hours a day, eleven months of the year, since 1912 and that most of the original belts are still in service. All of these short center belt drives are equipped with automatic belt wrapping, floating idlers. When I use the word "idler" it is at the risk of confusing the reader, as many of the text books on Mechanical Engineering do not distinguish between the properly designed belt wrapping, floating idler and what are ordinarily termed "swinging idlers" placed at random against the tight or loose side of the belt, tension idlers, binder pulleys, jockey pulleys as they are called in England, not to mention belt tighteners. The last mentioned name is particularly confusing, inasmuch as the words, "belt tightener," are often used to describe belt screw clamps used to tighten belts in the field in making a joint or making a belt endless.

For this reason, manufacturers of properly designed floating idlers have found it expedient to protect their designs by trade names.

Without going too deeply into the scientific reasons for the various advantages of the short center drive, it may not be out of place to recall the following fundamental formula for belt drives found in all textbooks of mechanical engineering:

In this formula, the value are as follow:

T_1=tension in the pulling side of the belt drive.
T_2=tension in the slack side of the belt drive.
e=2.72 and is the base of the system of natural logarithms.
f =co-efficient of friction between the belt and the pulley surfaces.
a=the smallest angle of arc of contact between the belt and the two pulleys in question the angle expressed in radians.

This formula does not take into account the centrifugal force acting on the belt but is stated to show here that inasmuch as "e" is a constant, the only way of increasing the useful working tension of the belt (T_1) and making the tension in the slack side of the belt as small as possible is by increasing "f" and "a".

It is possible to increase "f" by the application of various dressings to the belt and facings to the pulleys. But experience has shown the practice of using sticky belt dressings as detrimental to the life of the belt. To add any sticky belt dressing also causes dust to accumulate and form lumps and cakes on the belt and pulleys. This remark does not of course apply to beef tallow or neatsfoot oil, which may be termed belt lubricants.

As to facing pulleys with cork, wood, canvas or paper, the co-efficient of friction between the belt and pulleys faced with these materials is somewhat higher than that between the belt and cast-iron, and for this reason this scheme is often resorted to.

To make "a" as great as possible is the aim of the short center belt drive. The belt-wrapping, floating idler is used to maintain as large an arc of contact on the smaller of the two pulleys as possible and by making the pulley centers short also to increase the arc of contact with the larger of the two pulleys. It goes to show that the ordinarily unused part of the pulleys is just as useful for transmitting power as the part ordinarily used.

Of the many advantages of the short center drive, I might mention the following four:

1. Saving in floor space.
2. Accurately pre-determined and automatic control of tension in slack side of belt, causing elimination of slip and excessive bearing pressures, maintaining a permanent high efficiency of about 98%.
3. Freedom in location of shafts and their rotation.
4. High ratio of transmission.

The great saving in floor space now permits the use of belt drives in plants where floor space is at a premium.

Of other advantages which are not as obvious I might mention the full and automatic control of the belt tension. With open belt drives this is difficult to determine and as a rule is left to the judgment of the operator. On small drives the tension may be felt by hand but this becomes rather uncertain on larger drives and for this reason, particularly in plants where the atmospheric and temperature changes are great, the belt is likely to be either too tight or too loose. In the first instance, the high tension is detrimental to the life of the belt and bearings. In the second instance, it means excessive slip.

In the correctly designed floating idler, these factors are carefully calculated for the average load, for the peak load and of course the sizes of pulleys and belt speed in question. Furthermore there enter into the calculations certain allowances which to a great extent are determined from experience, taking into account the stiffness of the belt when new and when well broken in. For this reason, you will find as a "hall mark" of the correctly designed idler adjustable counterweights. The counterweights are so proportioned as to overcome the initial stiffness of the new belt and as it limbers up, the action of the counterweights is decreased. In this way, the drive may be operated with the least tension in the slack side of the belt, limiting the belt slippage to the natural creep inherent in all elastic drives.

Another important point in the design is the perfect dynamic balance of the idler pulley, static balance having proved insufficient. A certain amount of lateral stiffness is also essential in the design so as to offer the necessary resistance to the sidewise movement of the rapidly-moving belt.

It is rather interesting to observe how the floating idler is entirely automatic in its action and does the right thing at the right moment. Whenever the load increases the pulling strand of the belt stretches, the increase in the belt length is immediately taken up by the wrapping action of the floating idler, if correctly located (and this is an important point) and added to the working arc of contact between the belt and the pulley, so as to give the maximum arc when the power is at a maximum and due to the contraction of the belt when the power decreases, returning to the light load or idle position of the drive. On certain drives where the load fluctuations are rapid

to the contraction of the belt when the power decreases, returning to the light load or idle position of the drive. On certain drives where the load fluctuations are rapid and violent, it is sometimes necessary to equip the floating idlers with oil dash pots.

It is well known that elasticity is essential for the success of beater drives and that belt drives possess an elasticity not found in the unelastic metallic mediums of power transmission.

The high starting torque of beaters requires oversized motors which are ordinarily operated at fractional load with poor efficiency and power factor. To overcome this, beaters are often installed in pairs and driven by double-headed motors of a size only slightly above the combined load of the two beaters.

One difficulty with the ordinary open belt drive with the double headed motor is the fact that two belts purchased under the same specifications, will not stretch to the same degree. This uneven stretch of the belts cannot be taken up by the shifting of the motor without producing unequal tension in the two belts.

This condition does not exist when the short center drive is used. The uneven stretch of the belts is taken up by the idler and used to increase the arc of contact on the motor pulley. The idler compensates for adjustment of movement of the beater shaft whether this is done by regulation or caused by impurities in the stock treated.

A steadily increasing number of paper mills are using the short center drive in connection with either individual or double headed motor drives.

While the horizontal beater drive is and always has been the most commonly used, there is also a growing demand for a vertical drive that would remove a good part of the belting and lineshafting from the beater floor. The vertical drive reduces to a minimum the danger of contamination of the stock.

The first installation in connection with vertical beater drives was made in September, 1916, at a New England paper mill producing a high grade of bond paper stock. In this installation three beaters are driven from one 150 H.P. motor direct connected to a lineshaft. The owner's doubts as to the success of this arrangement were dispelled when the drives were started.

The floating idler is used as a starting and stopping device. With a few turns of a hoisting winch mounted on the beater floor, any one of the beaters may be placed in or out of operation. Because of the great arc of contact established by the idler, the belt will move instantly and the necessary and desired slippage, equivalent to that of a friction clutch, is distributed over a large portion of the belt. Experience has proved that this method of starting is in no way detrimental to the life of the belts, according to a statement by the chief engineer of this plant.

I wish to quote a part of his letter, dated June 15, 1921, wherein he describes the working of these vertical drices. In quoting however I have substituted the words "floating idler" for the trade name under which these floating idlers were sold to his company.

"Our procedure in starting varies according to the condition in which the beaters are in, whether they are freshly furnished, well broken in, or empty. In starting with the beaters furnished and the floating idler raised, the motor is brought up to speed and floating idlers lowered until the belt picks up the load. We have found that this is in no way detrimental to the life of belts as our motors are comparatively low speed and the belts immediately turned to a new position during the slipping moments while the roll is getting in motion. We have run these floating idlers three and one-half years and do not know of a single instance when we suffered from a burned belt due to the starting operation. If a roll gets blocked and the engineer is not immediately aware of the fact it is pretty certain that a bad place will be made in the belt, but this feature is true on any kind of a belt drive whether equipped with floating idlers or otherwise. Our shutdowns Sunday mornings oftentimes come when a beater will be left empty in which case we find it unnecessary to raise the other two floating idlers inasmuch as the motor is able to start the other two beaters with the rolls well up. In a quick shutdown which we rarely have it is customary to raise the floating idlers and clear the rolls one at a time."

IS THE INDUSTRY STILL IN THE "CLAW PERIOD"

Arthur C. Hastings Is Not Sure and Tells Why Associations Are Necessary

Puzzle: Find the Third Lobster

Arthur C. Hastings, a former president of the American Paper and Pulp Association, was asked by PAPER *to contribute an article for the Convention Number of* PAPER *dealing with his reminiscences. In reply Mr. Hastings has sent a Kodak snapshot taken in* 1905. *The picture is reproduced herewith. It shows Mr. Hastings holding a pair of lobsters with big claws dangling. Mr. Hastings writes:*

A FRIEND of mine sent me the enclosed snapshot taken in 1905, and I have been wondering whether the papermaking fraternity, of which the subject was one, had changed very much in twenty years. While the picture shows two lobsters certainly, the question is whether there were not three there all the time, and whether times have changed much.

"I have always thought that there was only one salvation for any manufacturing industry, and that was to live up to the old law that has never been changed, known as the law of supply and demand.

"All efforts of associations in every line of business have been with a view to furnishing information tthat would enable manufacturers to conduct their business so that there would be no great fluctuations and resultant cutting of prices below cost.

"Unfortunately, the selfishness of human nature leads some to believe they can take advantage of conditions and run their plants to capacity while their competitor holds the bag. Eventually, however, I believe they suffer. Therefore I say that the picture perhaps shows that we have not really risen above the claw period.

"Sincerely yours,

"ARTHUR C. HASTINGS."

Where Scientific Precision has Replaced Guess Work—

IN such a process as the production of felts for paper mills absolute control of the processes, accurate to the last detail, is essential to success.

Hamilton felts are made under such control. We know the precise contents of every solution; the exact degree of heat in every dryer; the nature of the fibre we are handling and the proportion of the mixtures.

This modern precision has come to the aid of a practical experience running back 66 years. It has made possible products like the Hamilton A plate felt—a boon to hundreds of paper makers.

The demand of paper makers for this felt has astonished us. Every month it grows noticeably greater—and once a mill has used A Plate felts it keeps ordering more! Hamilton felts are made for every paper mill use.

You will recognize Hamilton felts by two blue lines running the full width of the felt with one shorter blue line between them.

Let our service men help with your felt troubles whether you are now using Hamiltons or not.

Paper Trade Men War on Imports

Work to Devise Ways and Means of Meeting Problems to Come Up During the Coming Year

STRIVING to combat the iniquitous import problem, working to keep down selling and distribution costs and incidentally giving much good advice to the paper manufacturers themselves, the twenty-first annual meeting of the National Paper Trade Association of the United States was held at the Waldorf-Astoria on April 8. There were a wealth of spirited discussions and every person attending gained many new ideas of value.

The meeting was called to order by James A. Carpenter, Vice-President and Chairman.

Statistician Leslie M. Pape in his report said, "I would like to give a few statistics which have a bearing on the present situation in wrapping and tissue papers.

Following a decline in orders in November and December, 1923, there was a large increase in orders in January, 1923. This buying held up through February and March and then fell off rapidly, reaching its low about July. Buying continued at about the July rate until January and February, 1924, when again there was a substantial increase, and orders exceeded production for the first time since March, 1923. Shipments by merchants fell off about May or June of 1923, but showed a seasonal recovery in the fall. Stock in the hands of manufacturers were considerably higher at the end of 1923 than at the end of 1922 and a little higher in the case of the merchants.

Production of wrapping and bag paper and of tissue paper was estimated by the American Paper & Pulp Association at 1,003,000 and 182,000 tons respectively, representing a slight decrease from 1922 and an increase of about 15 per cent over 1919, a year which compares favorably for general business activity. It is felt, however, that the estimate for 1923 for wrapping and bag paper was too low and my own estimate is that production was at least equal to the 1922 production of 1,048,000 tons.

No change is contemplated in the statistical plan now in effect. It is believed to be wholly satisfactory and it will be our aim to put it across in the best way possible.

Assistant Secretary C. K. Higgins, in his report said:

This year we have done more business in the Collection Department and I am, I think justifiably, proud of our record. I might say that in every case, except in the New England Association, we have shown a marked increase.

One topic was running under weight. We have a number of instances reported to us of tissue that was marked 10 pounds, which was actually 9 pounds. That is a difference of 10 per cent under weight and we feel that no mill could do that accidentally. That is too large a percentage under weight, and we felt that if paper was run that way, it was probably not accidentally; and we realize that perhaps some of the merchants are equally to blame with the manufacturer, but we are trying very hard to correct it and do away with this practice.

The next thing we talked about was misnaming of Kraft tissue. We refer to sample which were part sulphate and part sulphite called Kraft tissue, but clearly it was not Kraft tissue.

The next topic discussed was napkins. Size varying from 12 by 12 to 18 by 18, inclusive, original size being 14 by 14. We included in the standard size the sizes 13½ by 13½.

We also strongly recommended that each bundle be stencilled at the mill showing exactly what was in it, and the same be stencilled on any carton, where they are used.

Also in the committee we discussed the subject of over-production in tissues. It doesn't take very much discussion when there is such an evident over-production; we simply have to admit it.

Another thing that was recommended was that we go back to the practice, which has evidently been abandoned of using the Tissue Association labels, which guarantees the count.

We took in the Executive Committee the ways in which the National Association has assisted in preventing certain changes in freight rates in connection with crepe napkins and towels. This is another phase of the situation which we would like to give some publicity to.

This is a very definite, tangible thing which we have accomplished. We assisted in preventing a change in rates which would have increased the cost to the consumer.

Opinion was expressed that when you sell paper you should not neglect to sell the service that goes with it; that the service the paper will render should be emphasized and that instead of having order takers you should have real salesmen, salesmen who instil in the minds of the buyers the service that the paper will do, and the reasons why that buyer should buy that particular sheet from that particular house.

N. A. Schoenbucker in his report said: Nothing has given me greater encouragement and gratification since I have been engaged in this Association work than the developments which have occurred in the Wrapping Paper Division during the past year. I do not infer that this feeling arises from personal accomplishment. What I mean is that:

First: It has been a pleasure to witness the constructive changes which have been affected by individual merchants as a result greater detailed study of their businesses arising from Association educational work, and

Second: It has been an even greater pleasure and really interesting to see how many Wrapping Paper Merchants have gone about the job of self improvement in net profit regardless of competitive conditions.

The behavior of the market in the calendar year of 1923 spoiled what would otherwise have been a very satisfactory year for some from the standpoint of net profit. Many did, however, show satisfactory net profits, all things considered, despite the unfavorable reaction of the market.

This again brings home the fact that a break in the market of ten per cent wipes out from three to five months of net profits on warehouse business. While merchandising margins are steadily approaching somewhere near the ideal, on warehouse sales, for the "average" merchant, such margins are by no means adequate to withstand even a slight shock from market losses.

Department stores universally follow the custom of adding into the regular mark-ups a percentage based upon past experience to cover sales, mark-downs, close-outs, etc. There is no reason why Wrapping Paper Merchants should not provide a similar reserve for market losses in their individual mark-ups. This could be done by adding a given percentage of the mill invoice cost along with freight and difference in discount, and then starting the mark-up from the total of these.

From a merchandising margin and also from a market standpoint, it would seem as if the first six months of 1924, namely the period we are now in, should be an excellent barometer for every Wrapping Paper Merchant to gauge the effectiveness of his management and policies.

In the wrapping paper field it may be interesting to note that the tonnage of orders placed for the week ending March 31st was about 30 per cent more than for the week ending March 14th and is higher than the average rate of consumption for the cycle of business running from March, 1922, to July, 1923. The volume of business in 1923 increased about 10 per cent to 12 per cent over 1922 and orders for the last week of March were in excess of that figure. And it seems to me that such an increase in March is rather unusual, unless there be a demand, particularly since we have all thought that buying was usually withheld until after the annual convention here. Apparently this has had no effect this year. Of course, the amount of orders placed in any one week has little to do with the year's business except as an indication of the immediate surface conditions, but there are some very important factors which should be considered when deciding what the business is going to be in the future. I think one of the most important features is that labor is well employed and at good wages and that the farmer is in a whole lot better situation than he would have the general public believe and the fact that both the wage earners and farmers are buying is evidenced by the fact that the carloading of all commodities for the first three months of this year are far in excess of the same period for any other year, not excepting 1920.

Perhaps the second thing to be considered is this much talked of overproduction which in my opinion is very much over-stated. It seems to be an easy matter to talk of six or eight new machines with a production of fifty to sixty tons each coming into the market every year, but I find that most of these do not materialize. You take the statistics of the industry over a period of time and will find that the productive capacity is made to pretty well fit the demand. The limitation of the mills to store stock, if for no other reason, will control this matter of overproduction. Analyze the stock on hand in the mills today, deducting from these the amount necessary to have on hand, of orders in course of manufacture, partially assembled cars, and so forth, and you have about three weeks' supply for the country. Suppose there was only three weeks' supply of some other commodities you may think of in the hands of the manufacturers and there would be a great commotion, but such a situation in the wrapping paper industry disturbs no one.

Speaking of Production

Two Cylinder Machines, 50 and 74-inch, are constantly on the "go" here—manufacturing Tags, Covers, Plain and Oiled Tympans, Heavy Wrappings, Envelope, Waxing and Coating Papers, Specialties in Natural and Colors.

There's a Fourdrinier Machine, too, 80-inch— turning out plain and striped Wrappings, Twisting, Coating, Waxing, and Envelope Papers, Specialties in Natural and Colors.

What's more, there are two Yankee Machines, 120-inch—making Tissue Papers, Machine Glazed Waxing and Specialties.

DETROIT FIBRE

"MAKERS OF PAPERS OF STRENGTH"

Detroit Sulphite Pulp & Paper Co.

DETROIT, MICH.

Coupled with the matter of production is that of importations. This to me seems to be most serious and the most disturbing factor we have. Comparitively only a small quantity is brought in, I think it runs about 4,500 tons per month, but the prices at which it is sold help to fix the price on the entire domestic production of 75,000 tons per month, particularly in a period of liquidation or slow buying. It seems ridiculous that so small a quantity should have an effect, but it does, and in the long run it hurts the merchant just as much as it does the manufacturer.

With the variety of good papers made in this country there is no necessity to buy wrapping papers abroad and particularly from mills which are practically, if not already, bankrupt, and which are dumping product in this market without regard as to the cost. Paper bootleggers have made a business of getting in misbranded shipments but with the help we hope to get from government officials we may be able to stop some of this smuggling and improve the situation. Merchants can help in this situation by showing their loyalty to American institutions. Our neighbor to the north occasionally reminds her subjects of the slogan, "Canada for the Canadians," and I think it is about time we wake up to the idea of "United States for U. S., us."

I believe we have before us at least three months of good business, mills operating at actual productive capacity and shipping all they make and probably materially reducing such stocks as they may have at the mill.

Closer co-operation between mills and merchants will help this situation greatly. Our interests are identical, and the sooner we can come to realize it the better for all concerned. In the past, weak-kneed mill representatives, cold-blooded purchasers among the merchants, and Old Dame Unconfirmed Rumor have cost both merchants and manufacturers immense sums of money. These have done more to strangle good potential markets and reduce inventory values than any other factors. This condition I believe is improving and I hope that by co-operation we may bring about a desirable situation for all of us.

I believe that 1924 business will exceed 1923 and that that at the end of the year we may look back on it as one of the most satisfactory in the wrapping paper business.

The Fine Paper Division met April 9th.

Fritz Lindenmeyr, Vice-President in charge of Fine Paper Division, was unable to preside. He has been seriously ill.

The secretary's report said: As we see it, the Fine Paper merchant generally is dissatisfied with his lot. His dissatisfaction is primarily caused by the fact that in 1923 he distributed a tonnage of paper nearly equal to the record year, 1920, but at a net profit which was entirely inadequate based on the column of business transacted. He realizes that price competition, which on some lines was never keener than during the past year, is largely responsible for the failure to realize adequate net profit; that this unsatisfactory price condition was due to over production and that with the large increase in productive capacity little improvement can be expected until demand catches up, which in all probability, will not be for some years to come.

A considerable number feel it is possible to reduce expense and thereby obtain the desired relief, while others believe expense is incapable of sufficient reduction to meet the need, and increased mark-up is the only solution.

The paper merchant is spending large sums to promote and increase the sale of the papers he distributes and any increased sale he may obtain over and above the normal increase in the consumpton of paper is at the expense of his competitor. What we are wondering is whether if a considerable portion of these individual expenditures were pooled, they could not be used to better advanage for the industry as a whole. For example, if the buyer of printing could be educated to place his orders for quantities which would take full packages, the cost of breaking original packages would be reduced to a minimum and a real saving affected. Or, again, if the printer could be fully informed of the cost to the merchant of "returned goods" we cannot but believe he would be far more careful in his ordering with a resultant decrease in this growing evil. Again, is it not possible that this pool could be used to grow a printing order where none grew before and thereby increase the consumption of paper and without in any way encroaching upon the function of the printer? There are undoubtedly possibilities in collective advertising which are well worth serious consideration by the Association and by its members.

Statistician Leslie M. Payne reported: Production of Fine and Book paper was estimated by the American Paper & Pulp Association at 364,500 and 1,078,800 tons respectively. The 1923 production of Fne Paper represented an increase of one per cent over 1922 and six per cent over 1919, a year which compares favorably with 1923 for general business activity Book paper production shows a larger increase, as might be expected, being ten per cent over 1922 and 18 per cent over 1919.

It is estimated that production of all grades of paper in 1923 was equal to 76 per cent of the machine capacity for that year. This compares with 86 per cent in 1920 and 62 per cent in 1921. In the four years 1920 to 1924 machine capacity increased 29 per cent, whereas production increased 16 per cent. In Fine Paper, capacity increased 11 per cent against an increase in production of six per cent. Book paper machine capacity increased 34 per cent against an increased production of 18 per cent.

The Executive Committee were in session all of the afternoon of Monday, and they recommended the passage of the following resolution, which duly went through:

"Resolved, that the Vice-President appoint a committee of five to consider ways and means of promoting direct by mail advertising, which committee shall report at the next meeting."

The comittee also reported that it passed a resolution interpreting Section 9, subdivision B, of the Book Paper Trade Customs, which reads as follows:

"Paper shall be close to the weight ordered, subject to a variation in the nominal weight not exceeding five percent above or below the ordered weights, and eight per cent when below 45 pounds or above 100 pounds basic weight. Paper within this range shall constitue a good delivery.

"The interpretation of the Committee is that under this Section paper is presumed to be uniform in weight that it did not permit of as wide a variation as ten or sixteen per cent between material portions of the shipment."

This section has caused a number of misunderstandings in deliveries of Book Paper where portions of the delivery were above the normal weight and within the range of five per cent, and portions of it were below the normal weight, and still within the five per cent; and it is the belief of your Executive Committee that that custom was not passed and adopted and agreed to with any idea of permitting a delivery of that sort. It was simply to take care of manufacturing difficulties and that paper was presumed to be of uniform weight, that is, paper in one delivery.

It seems to me, from a careful study of the detailed statistics of the habits of the buyers of printing paper, that the cost of distribution in the paper business as we are doing it today has not reached its peak yet. As an example, is direct by mail advertising a good thing, and should some people use it and others not? I don't think there is a man in this room that would say that everybody shouldn't use direct by mail advertising or advertising of some sort, who has some service or some commodity to sell.

While sufficient facts are not available to prove the following statements as to degree they will be recognized to be generally true in principle, namely—

1. In 1910, a very large part of the value of stocks carried by a great many merchants were on consignment. Today the practice of consigning merchandise is uncommon in the trade with few exceptions.

2. In 1910, the turnover of merchants' stocks was more frequent than now because of the wide custom and practicability of selling job lots and because generally fewer items of merchandise were carried.

3. As late as 1910, printers stocked paper to a considerable degree. This made the selling of job lots practicable in those days. Now printers' paper stocks throughout the country show an average of less than two per cent of the total value of printers' sales. Practicaly no stocking of papers prevails among printers today. This change in the buying habits of printers between 1910 and the present time has been accompanied by a heavy increase in orders placed with paper merchants for quantities less than case lots, and less than ream lots, and also a great increase in orders involving fractions of a package along with full packages.

4. In 1920 the orders and tonnage distributed of the better grades of flat papers showed a much higher ratio to total orders and tonnage than prevails at present.

5. The two preceding factors jointly have driven the average sales value per order down to a much lower relative amount than that which prevailed in 1910.

The Present Situation

In view of the above, it hardly seems necessary to go to further ends in order to show why most paper merchants failed to earn legal interest on capital in a reasonably normal year such as 1922.

Adequate, sound remedies must be found to correct present condition. They will not just happen; they must be found. Let us review what has happened, before, during and after the war so as to crystalize impressions into a definite understanding of the effects of change in the underlying operating conditions of paper merchants.

1. Prior to the war:

(A) Large quantities of consigned stocks gave merchants an opportunity to do a large volume of business on a smaller capital, thereby increasing capital turnover, and reducing inventory losses.

(B) Turnover of merchandise owned was greater because of fewer items, unlimited territory and ability to sell job lots in large quantities out of stock.

(C) Ratio of fixed capital invested in delivery equipment, office equipment, etc., was far less than at present on total tonnage because a given tonnage was distributed with fewer deliveries, less bookkeeping, etc.

(D) There was no income tax to pay, or rather federal taxes were inconsequental

SULPHUR for PULP MILLS

In buying sulphur the Purchasing Agent looks for

QUALITY
QUANTITY
SERVICE

The Texas Gulf Sulphur Company can fill the requirements of the most exacting of Purchasing Agents in regard to these points, it has

A product 99½% in purity.

An enormous reserve under ground and stocks on the surface containing many hundreds of thousands of tons.

A mine located upon the Santa Fe System, and through its connections reaching all points, North East, South and West—and Galveston, Texas, one of the biggest ports on the Gulf of Mexico, as an ocean shipping point.

TEXAS GULF SULPHUR COMPANY
(Incorporated)

GENERAL OFFICES
41 East 42nd St., New York City

SULPHUR DEPOSIT & PLANT
Gulf, Matagorda County, Texas

Because of the above conditions, 2½ per cent net profit on sales was equal in those days to about 5 per cent net profit on sales today, in so far as returns on invested capital of many merchants are concerned.

2. During the war:

(A) Large gains were made from enhancement in the value of merchandise on hand.

(B) Rising prices caused gross revenues to increase at a more rapid pace than expenses increased.

(C) Heavy borrowings from banks, abnormally prompt payment of accounts by customers, and feverish demand for paper greatly increased capital turnover.

Because of the above conditions, good net earnings were made on invested capital (not sales) regardless of the unsound ratio of operating expenses to merchandising margins.

3. Now:

(A) With about double the amount invested for a given volume of sales with many merchants, capital turnover is cut in half and capital risks are doubled.

(B) Declining prices reduce gross revenues faster than expenses recede.

(C) Declining prices incur heavy market losses. A horizontal decline of ten per cent, in prices wipes out from five to seven months of good net profits.

(D) Federal income taxes takes one-eighth of net profits where prior to 1909 there were no Federal taxes and between 1909 and 1915 Federal taxes only took one hundredth part of net income.

These conditions have disclosed an unsound ratio of operating expenses to merchandising margins in the businesses of the rank and file of paper merchants. Do not fail to recall your net profits for such a good business year as 1923. If they appeared to be fairly good in your case remember how possibly three-fourths of your net profit may have been earned because of conditions beyond your power or influence as was pointed out in a previous paragraph.

The Cardboard Committee

The report of the Cardboard Conference Committee was made by William H. Holden, the chairman.

A. H. Seyler, of Alling & Corey Company, Pittsburgh, gave an address on business.

Among other things he said, "this mad scramble for price supremacy has had a reaction. This cutting of prices has carried with it a similar reduction in quality until the demand has swung the other way for a return to better value in paper. Twenty years ago seconds were a byword, but with standardized products the proportions of 75 to 25 were reversed; and it s encouraging to find some manufacturers advertising the return trend to better values."

He asked: "Are there too many paper alesmen? Freight? Sales promotion expense?

"Increase expense through mill convenions and customers' mill trips.

"Revamping of stocks. Encouraging the sale of better grades.

"Reduce sulphite bond stocks to two grades.

"Duplication of line.

"Strict adherence to list prices (out of tock orders). Transfer.

"Installation of cost accounting on diect, indirect and house sales.

"Careful revision of warehouse expense —of delivery expense.

"Insurance.

"Careful investigation of the recommenations of the accountants committee."

Noble Gillette of Chicago, spoke for the Western Association.

The General Meeting

The general meeting on Wednesday afternoon was called to order by Frank W. Power, the Chairman of the meeting.

Secretary's Report

Secretary Ridgway, in his report, said in part:

"This meeting marks the twentieth anniversary of the organization of this Association. A preliminary meeting was held late in 1903, but formal organization was not perfected until February the 8th, 1904, at the time of the annual meeting of the American Paper & Pulp Association.

"A comparison of conditions in the industry today with those of 1904 leads to the conclusion that they are now far more satisfactory from almost every angle and, without fear of contradiction, we firmly assert that the National Association was a most powerful influence in effecting the changes which have occurred and has unquestionably proved its value to the paper merchants of the country.

"The individual membership of the constituent associations shows an increase of 24 over a year ago and numbers 367 today as against 343. This increase is most gratifying but we believe it will require active effort on the part of the officers of the local associations to keep up present membership.

"We are strong in our belief, based on three years' experience, that the Cost Accounting Department, under the most able direction of Mr. Schoenbucher, has been of the utmost value to the Association and to the individual member. The greatest present need in paper merchandising is accurate knowledge of costs of distribution. Until relatively recently paper merchants almost without exception were satisfied to know the results of their operations annually or at most, semi-annually.

"We are confident that the work of the accounting department is largely responsible for this much to be desired condition and the department, in addition to promoting the adoption of the "Uniform Classification of Expense," so that figures of individual houses will be comparable, will continue its studies of costs of distribution both as a stimulus to the individual to seek like knowledge of his own business and to point out generally ways and means for the reduction of the cost of the distribution of paper.

"We again wish to bring specifically to the attention of the members the legal limitations of the Association's activities in this direction. It can develop the facts and, having done so, must leave the remedy entirely and exclusively to the individual. It cannot suggest the remedy and it would seem to us that to do so would be entirely unnecessary for, if the facts are properly developed and presented, and the individual finds upon investigation that they apply to his business, he will eventually find the remedy.

"A little over a year ago, Mr. Pape took over the management of the Statistical Department. He has a thorough training in statistical work, and a real interest in and enthusiasm for the development of the plan.

"Direct selling by manufacturers is decreasing in most lines of paper.

"If the view of the Federal Trade Commission, as reflected by certain of the provisions of the cease and desist order entered in the proceeding against the Pacific States Paper trade Association, represent the law, the Association is bound hand and foot and can make no move whatever. The provision of the order to which we refer goes so far as to prohibit the Association, or any two or more merchants, acting in concert, from even communicating directly or indirectly with a manufacturer upon the subject. An appeal to the Court to review this order has been taken and we believe this order of the Commission will not be sustained.

"Business has not been satisfactory. There seems to be no doubt that in tonnage distributed, 1923 was nearly equal to 1920, the record year, and had price competition been less severe, the year would have been entirely satisfactory. There is a measure of satisfaction, however, in the fact that it was better in all respects than either of the last two preceeding years. The basic trouble appears to be the large increase in productive capacity. We have heard it said, and are inclined to believe, that the increase in papermaking capacity in the past five years is sufficient to take care of the normal increase in demand for another ten years. Even assuming that this is an exaggerated estimate, the increase in some lines is so great as to warrant the conclusion that during the next five years at least, the capacity is ample to more than meet any demand which may arise. It, therefore, follows that for some few years to come competition, based on price, will be at least as keen as it has been the past year and it will require the most intelligent management on the part of the paper merchant to produce a net profit anywhere near commensurate with the volume done. As to values, there seems to be little likelihood of any declines based on cost of production which is probably higher than a year ago, and such declines as may come will be due to a lack of balance between supply and demand. A relatively slight recession in demand is likely to seriously effect this balance.

Conditions in general business are not entirely satisfactory. Some lines of business show signs of slowing down but others have recently and rather unexpectedly experienced serious falling off of demand. If we properly reflect the reports from individual members, the demand for paper since about the middle of last month has not kept pace with that of the first two and a half months of the year. This condition is of sufficient duration to permit of any conclusive deductions as to the future, but is is sufficient to warrant the exercise of caution.

The next feature on our program was an address "Simplification Program," by William A. Durgin.

The paper manufacturers think it will be tremendously to their advantage to have fewer sizes, the paper distributor knows it decreases his stock, increases his turnover, and by cutting down his investment runs up his profit, but the distributor feels very timid, that he can't do anything because the consumer demands the diversity. We have, therefore, used most of our influence these last few months, the last year and a half, in aiding the consumer to express himself. Only yesterday Mr. Sullivan, Secretary of the National Advertising Association, which as you know combines most of the major advertising of the country, told me that in circularizing his membership of 289, asking them to pledge their support in restricting the variety of sizes—eight sizes, to be specific, asked for a pledge of their support in issuing 68 standard sizes next year as their recognized limit. He secured in three weeks 189 pledges out of his entire membership of 289, and he says he will have at least 100 more within the next two weeks. There is a group of your large amalgamation, the National Publishers' Association, similarly getting pledges in support of standard sizes for their publications.

A motion duly made, seconded and unanimously carried, it was resolved that the sense of the meeting that the mem-

Warren's
STANDARD
Printing Papers

bers were in hearty support of the simplification program.

O. D. Street, formerly manager of Distribution of the Western Electric Company, now Director of Distribution of Thomas F. Logan, Incorporated, said in part:

Efficient distribution is a matter of necessity not only to the individual manufacturer but to the man in the streets as well. Indeed, it is a national problem directly associated with the social and economic development of this country.

The Middleman Is an Economic Necessity

I propose to take no time in discussing the question as to whether or not there is a place in American business for the middleman. Volumes have been written on that subject, but I assume that we here are of but one mind in recognizing that in a country such as this there can be no doubt as to the need of the middlemen.

However, to say that the middleman is a necessity in our economic life is very different from saying that the middleman is a necessary link in the distribution of every commodity or is a necessary agency for disposing of the output of every factory. The middleman is not essential to all these, and the sooner the middlemen perceive what their true functions are, and then devote all their skill in performing these functions well, the better it will be for them and for all of us.

It is estimated that about 80 per cent of our merchandise is sold to wholesalers who in turn supply the retailers.

At the present time too many concerns are selling their products direct which would be better off if they worked with jobbers. There is another class which would be better off if they cut out the jobber and dealt with the retailers and consumers. By the same token, there are jobbers who would be better off if they limited themselves to that service which they can do better and more cheaply than the factory, and if they stopped trying to be all things to all men.

A Distribution Cost-Finding System Needed

I have contended that the chief reason why so many uneconomical methods of distribution are employed today is because so little is known, even by the most expert, of what it costs to sell and distribute merchandise.

The situation would indicate that, for the good of the public at large, too much competition may well be quite as bad as too much monopoly. It is a recognized fact that a large output is required in order to effect low production costs.

One thing we need is more men who, like Henry Ford, can visualize a possibility for trade development and who will, by mass production and by rapid turnovers in distribution, produce and market a product which will make the public feel, when they buy it, that they have secured their money's worth and then some. More men with brains and capital who will "Fordize" in the production and distribution of commodities is the answer to a part of the question. The inspiration that would result from a few more successes like that of the Detroit manufacturer would be more beneficial.

To develop a system of distribution that will be both efficient and economical is a task that will tax the capacity of the ablest business minds of this and the coming generation—yet it will be accomplished.

While I expect the general price level to go somewhat lower than at present, I do not believe we are justified in looking forward to the time when anything like the pre-war level of prices will again prevail in the United States.

Advertising has probably done more than anything else to raise the standard of living in this country, and that higher standard of living has, of necessity, increased the cost of living. The demands which are made for a reduction in the cost of living are never coupled up with a desire to reduce the standard of living, yet one cannot keep his cake and eat it, too.

Modern advertising has increased the standard of living because it has created in the minds of our citizens a compelling desire to possess more and more luxuries, more and more labor saving devices for the home, better and larger homes, more and more bodily taste and soul-satisfying things. That is exactly what the experts claimed advertising would do, and what it has done. We do not miss the things we have not had or seen. It is what the other person has, far more than what we lack, that makes us discontented and stirs within us the keenest determination to acquire.

From now on distribution is to be the big job and management must develop skill in distribution if it is to prosper or if it is to safeguard its investments in production facilities. Otherwise competitors with better vision, who have organized efficient distribution departments, will, through these, come along and dominate the channels of trade.

The National Paper Trade Association recognizes that the high ethical standards now prevailing in the paper merchandising business are directly attributable to an individual adherence to the principles herein below stated, and believes that the restatement and promulgation of these principles will perpetuate the present high ideals.

First: I will act honorably in my business of paper merchant, and conform in all things to the highest standard in the industrial world, so that my business shall be worthy of my devotion and ideals.

Second: I will conduct by business so that it shall compel the respect and confidence of all who trade with me.

Third: I will not bear false witness against my fellow merchants and competitor, nor belittle him, nor impugn his honor, or covet his success.

Fourth: I will deal fairly and courteously with customers, neither misleading them by false promises, nor misusing the confidence which I gain.

Fifth: I will seek the co-operation and good will of the manufacturers, and by treating them with fairness and by fulfilling my obligations to them, gain their faith and trust.

Sixth: I will be just to my employees, seek to earn their respect and loyalty, and inspire them to the practice of the principles.

Seventh: I will conform to trade customs that are honorable, and keep faith with my trade associations when their principles are constructive and tend to the advancement of the paper industry.

Eighth: I will do unto others as I would they would do unto me, for by my deeds will I elevate all business practices.

It was resolved that the Code of Ethics as presented by Mr. Wilson, Chairman of the Committee, be accepted and adopted.

O. A. Miller, the first President, spoke.

Thirty years ago the idea of dealers' associations was promulgated. I think it was established in 1894, thirty years ago. In the next decade there were six developed as follows: Boston, New York, Baltimore, Northwest, Central States and the Western, which was the first. I think at the time this organization was first started that I was President of both the Western and the Central States. The gentleman who more than anyone else is responsible for calling the meeting in this city in November of 1903, is John E. Linde, who has since gone to his reward. Mr. Linde was our first Secretary and served splendidly, and I think to his untiring work, more than anything else, we are indebted for the fine start that we got.

The others who were in at the beginning in November—the organization was made at that time and ratified in February—I think all of the original officers representing six associations that were then in existence, were made permanent in February following.

W. F. McMillien, President, Boston Association; W. B. ivermore, Secretary, Boston Association; W. D. May, President, New York Association; Hazard Lasher, Secretary, New York Association; E. T. Mudge, President, Baltimore Association; Gordon L. Reese, Secretary, Baltimore Association; E. J. Stillwell, President, Northwest Association; P. N. Myers, Secretary, Northwest Association; E. U. Kimlark, Secretary, Western Association; H. F. Woods, Treasurer, Central States Association.

These officers were elected.

President, William F. McQuillan, of Boston.

Vice-President in charge of Fine Paper Division, A. M. Miller, of Columbus Ohio.

Vice-President in charge of Wrapping Paper Division, J. A. Carpenter, of Kansas City, Missouri.

Treasurer, A. J. Corning, of Baltimore, Maryland.

Takes New Position

Walter J. Zaph, who has been assistant secretary and treasurer of the Carthage Sulphite, Pulp and Paper Company for the past several years, has recently been appointed assistant manager of the Dunn Sulphite Company of Port Huron, Michigan. He has already assumed the responsibilities of his new position. Therdore Dunn, prominently known throughout the United States is president of the company which Mr. Zaph has joined.

Mr. Zaph's family expect to join him in Port Huron in about a month and will make their home there. Both Mr. and Mrs. Zaph were well known in Carthage, where they had resided while Mr. Zaph had been connected with the Carthage company. Both took active parts in local organization and civic work.

Cut Down Consumption

The Ontario government, which is a large consumer of paper and printing is cutting down on its expenditure in this regard. The Printing Committee of the Legislature has decided to eliminate the printing of a lot of reports hitherto put out and the quantity of others will be cut down. The committee has also recommended the appointment of an editorial committee to supervise all government, including departmental publications and blue books, with a view to economizing on the use of paper and printing.

Postpone Meeting

It has been announce that the Northwest Division of the Superintendents Association would hold a convention at Marinette, May 2nd and 3rd.

The Committee has decided to postpone this meeting until the latter part of July. The main reason for postponing it conflicts with the meeting at Dayton.

Further information about the coming meeting will be published as soon as definite data is available.

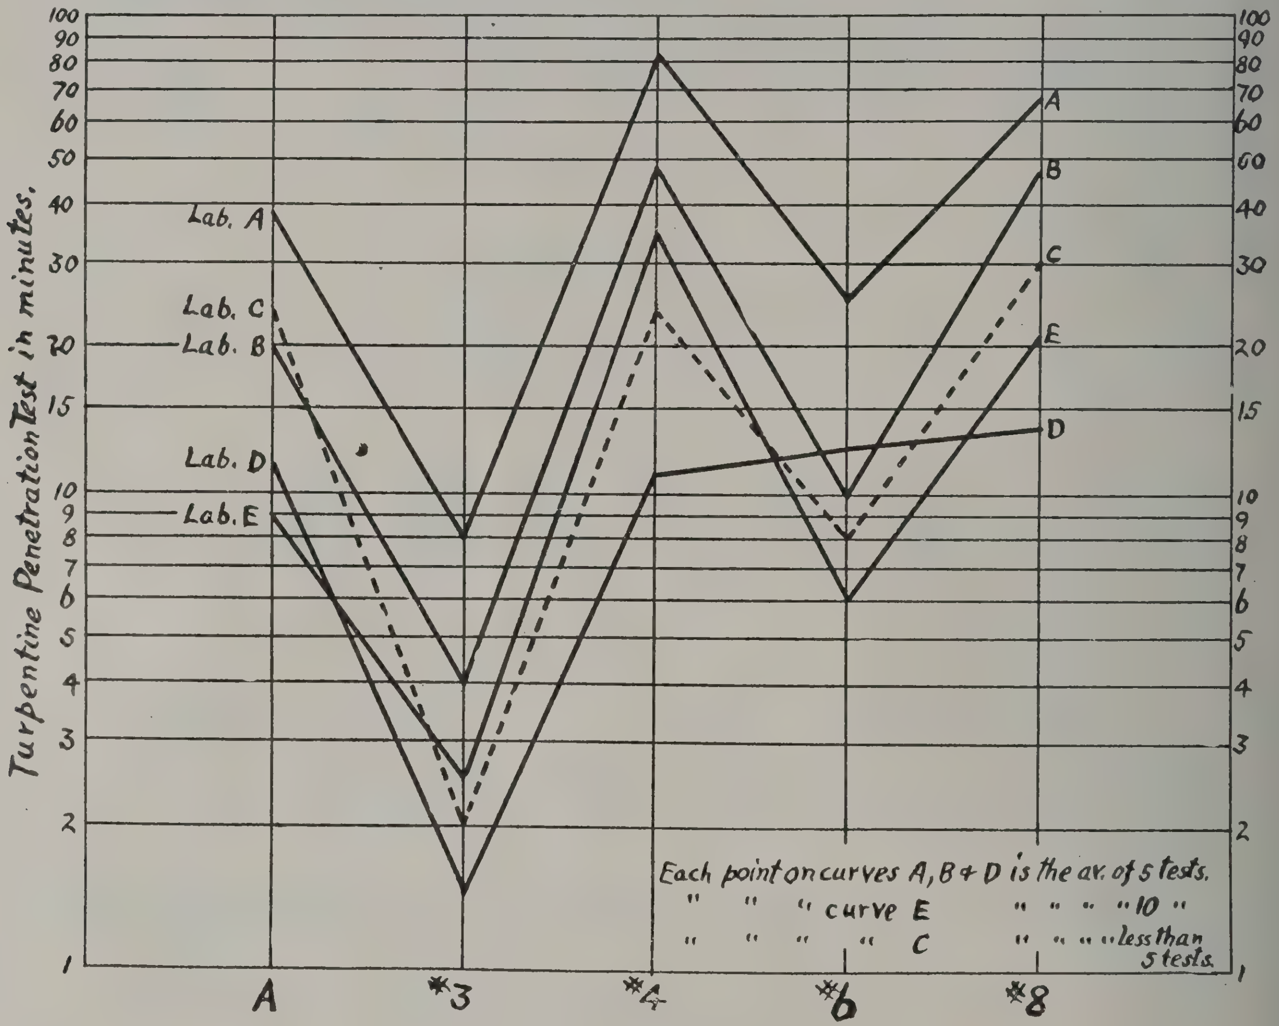
The Turpentine Penetration Test for Greaseproof Paper

By H. A. SMITH*

THE well known blistering test for greaseproof paper is made by holding a burning match close under the sheet and noting the magnitude of the resultant blisters as an indication of the paper's grease-resisting quality. This leaves much to be desired in the way of accuracy, as certain papers which blister only slightly may be more greaseproof than others which give large blisters. In an effort to arrive at a reasonably quick and more satisfactory method for determining the relative greaseproof quality of different papers several ways were tried.



COMPARATIVE RESULTS IN DIFFERENT LABORATORIES

Method of Bromley Tried

Greases of various sorts, or heavy oils, applied as a practical test took several hours or even days to penetrate the paper, and so unduly prolonged the test. The method of Bromley[1] was then tried. This calls for the drawing of a mark with a copy-ink pencil on one side of the sheet, reversing it, applying a large drop of water to the other side over the mark; and watching the effect on the mark as the water penetrates. The endpoint was very uncertain and in any event the test measured the waterproof, rather than the greaseproof, quality of the tested paper.

Turpentine has long been used to distinguish between greaseproof and nongreaseproof papers. The usual system is to place a little turpentine on the test sheet which is flat on a piece of white paper. If the turpentine does not make any spots on the under paper in several minutes the sheet tested is considered greaseproof.

A More Quantitative Test

The following more nearly quantitative test was developed using the penetration time of turpentine as its basis.

At least 5 *uncreased* sheets about 4 inches square are cut from each sample to be tested, marked, and each one placed on the lower part of a piece of clean white paper about 5 x 7 inches that is flat on a table. It is a help to have the upper righthand corner of each test sheet turned up sharply to serve as a handle, and to have a small weight on the upper lefthand corner of each sheet of white paper, but not on the test sheet. About 2 g. of fairly coarse sand (grains about 1 mm. in diameter do very well) are placed on the center of each test sheet in such a way as to give a low-pile about 1 inch in diameter. The time is noted, and with a medicine dropper or a piece of glass tubing several drops of turpentine that has been colored deeply with some oil soluble color ("Newport Oil Mahogany D" made by the Newport Chemical Works, Passaic, N. J., works well) are carefully dropped onto the pile of sand on each test sheet. Enough should be used to saturate the sand, but not enough to spread to the edges of the test sheet and so go over onto the white paper. A 2½ or 3 inch watchglass is then inverted over each sand pile to serve the double purpose of lessening evaporation of turpentine and of keeping the greaseproof sheet in better contract with the white paper. Every little while the test sheets are slid back horizontally, taking care not to disturb the watchglasses or piles of sand, the under white paper carefully examined for spots of color from the turpentine, and the greaseproof sheets slid forward into position again. As soon as the *first* spot of color appears under any sheet, the time is noted, the total time in minutes it took the turpentine to penetrate the sheet calculated, and recorded as the *turpentine penetration test* of that sheet. Later the 5 tests on the 5 sheets from one sample are gotten together and averaged to give the T.P.T. of the sample tested. In case there is doubt as to whether a spot on the white paper is caused by turpentine or not, it is often helpful to hold the white paper up to the light. A *fresh* turpentine spot appears translucent. It is necessary to carry on the test where the light is good, preferably before a window. If the test should last long enough to cause evaporation of turpentine, a drop is added from time to time,—enough to keep the sand practically saturated.

The caption on the cut on page 160 is in error. It should read "Comparison of Butter and Turpentine."

Keeping Track of Group Test Sheets

An easy way to keep track of a group of test sheets run at once is to jot down the time the test started, then every 2 minutes for the first 30 minutes; if the test runs longer than that every 3 minutes for the next 30 minutes; and, if the test continues, every 5 minutes till the last sheet is penetrated. Then all sheets being tested are examined at every listed time and the identification marks of the sheets found penetrated at that time are written alongside the time figure. When the test is finished the various figures for the 5 sheets from one sample are averaged for the T.P.T. of that sample. Working as outlined above at least 15 test sheets can be run at once unless the penetration time proves to be exceptionally short.

L. L. BROWN PAPER CO. & LINEN LEDGER PAPERS
L. L. BROWN PAPER CO. LINEN LEDGER PAPERS
1 9 2 4

75th Anniversary of L. L. Brown Quality

THE ORIGINAL L. L. Brown Mill started running in Adams, Mass., 75 years ago. It was founded on the idea of making rag-paper for record-keeping and business use,—rag-paper that would endure. For 75 years, these mills have kept to that ideal. Records inscribed on Brown's Linen Ledger, no matter in what year, are still as readable as when written. This is a remarkable proof of *quality* in a substance that only time can prove.

Brown's Linen Ledger

Eliminating Errors

In order to eliminate possible errors due to differences in the turpentine used, to differences in the conditions under which the tests are made, or to the personal equation in determining the endpoint, this test should be made a comparative one whenever possible. That is, one set of sheets from a sample of known quality should be tested together with the sheets from the sample whose quality is being determined.

When carefully run this test gives the penetration time for the least greaseproof point in the tested area, which is what is wanted, as it is the weakest points that give trouble through penetration of grease in actual use.

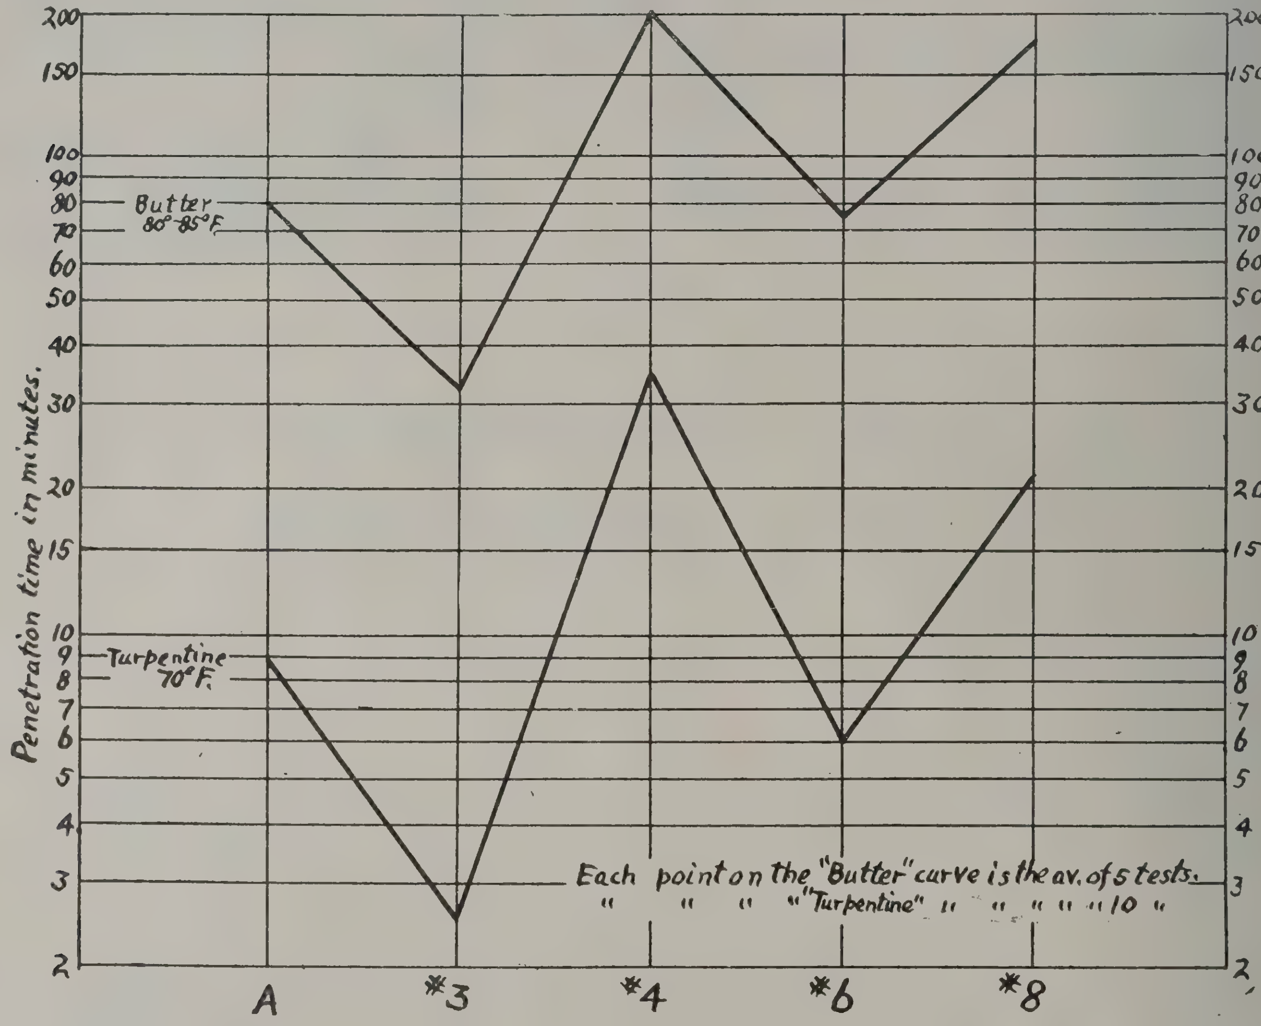
Penetration of Turpentine and Butter

Tests were run in order to find the relation between the penetration times of turpentine and of butter on a group of 5 samples. Ten turpentine penetrations were made on each sample at room temperature (about 70° F.) and five butter penetrations at 80° to 85° F. The butter tests were run at the higher temperature in order to cut down the time of testing by keeping the grease in a semi-fluid state. Results are given graphically in Fig. 1.

On a chart of this kind when two curves are parallel it shows that the values plotted on one curve bear a constant ratio to the corresponding values plotted on the other. It is easily seen that the two curves of Fig. 1 approach parallelism, and hence that the turpentine test has a reasonably constant ratio to the butter penetration test, on the various samples. At least the ratio is nearly enough constant to indicate that turpentine can be reliably used to test the greaseproof quality of paper.

Comparing Results

In order to see how results obtained by different people would compare, test sheets from the 5 samples used in the butter-turpentine comparison which were originally selected from the products of different manufacturers as covering a wide quality range were submitted to four other laboratories to be given the turpentine penetration test. The method they follow did not call for the use of any sand, and so differs in that slight respect from the one given here. Sand (the use of which was suggested by F. T. Carson of the Bureau of Standards) would have made no difference in the results which are shown in Fig. 2.



Comparative Results in Different Laboratories

Note the close approach to parallelism of the curves showing tests obtained by laboratories A, B, C, and E. Although the absolute figures on penetration times found by the different laboratories vary widely, each found almost the same relationship among the samples, and so checked each other fairly well when the test is considered as a comparative one. The result of Laboratory C are averages of less than 5 tests on each sample and so may be out somewhat on that account.

Why laboratory D should be so out of line in its findings on sample No. 6 is not known. It is possible that the paper from which these test sheets were taken was not uniform.

Causes of Large Differences in Figures

The large differences in the absolute figures found by the various laboratories may be due to any or all of the possible causes mentioned at the end of the testing method, but are most probably due chiefly to the last named,—the personal equation in determining the endpoint. In fact one laboratory reported difficulty in determining when penetration became general. It is the *first* appearance of color that should be noted, and not the much more indefinite time when penetration became general. Laboratory E had done a good deal of work with the method and through greater familiarity with the test may have selected an earlier endpoint. So far as is known the other laboratories had never tried the test before.

The following laboratories cooperated in trying out the proposed method: American Writing Paper Company, Holyoke, Mass.; Bureau of Standards, Paper Section, Washington, D. C.; Hamersley Manufacturing Company, Garfield, N. J.; Mt. Tom Sulphite Company, Easthampton, Mass., and United States Testing Company, New York City.

* * *

To Plant Trees

The planting of trees along the highways in Oregon is a movement that is sweeping across the state. The highway commission, women's clubs, commercial clubs, citizens of towns and ranchers along the Columbia highway are pledging to plant definite lengths in trees. Trees will be planted along other highways. Arrangements are being perfected whereby the school children of eastern Oregon may assist in the tree planting movement.

That the best results may be secured it will probably be necessary to establish certain rules and regulations governing the tree planting. The highway commission could do this work. School nurseries are already being established and trees for planting are to be raised from seed. Governor Pierce of Oregon says that the "executive department will assist in every way possible in making the highways of Oregon the most attractive of any state in the country."

BECK SPEAKS ON THE NEWSPRINT SITUATION

Secretary of Canadian Pulp and Paper Association Makes Frank Statement

As much has appeared in print respecting a profitable break on the Canadian newsprint market, the following statement on the situation made by Secretary Edward Beck of the Canadian Pulp and Paper Association is of interest:

"There is absolutely nothing in the newsprint situation, either in the United States or Canada, to support the pessimistic statements originating in certain quarters and being widely circulated through the press to the effect that a break in the newsprint market is imminent. The industry is in a perfectly healthy condition and while Canadian production for the first quarter of the year shows an increase as compared with the same quarter last year, shipments have kept pace with increased production. Individual mills may show a smaller production than last year, but the gross is greater. There has also been a falling off in United States importations of newsprint from abroad.

"Consolidations of daily newspapers, such as those that have taken place in New York, and of which so much has been made, have not affected the situation at all, except in a favorable way. The consolidated newspapers, experience has shown, actually consume more newsprint than when they were operated as separate units. The explanation is that readers as a rule do not purchase more than one newspaper, and that when the one they patronize stops, they simply transfer their patronage to one of the survivors. It is also a fact that one strong newspaper is a much better customer for the newsprint manufacturer than two weak ones.

"Canada produced 30,511 tons more newsprint in January and February this year than in the corresponding months last year, and the United States 4,031 tons more. The total increase thus amounted to 8 per cent. The production of newsprint in January and February, 1923, however, was greater by 16 per cent than the production during the same months of 1922. For March this the figures, when available, will show an even smaller relative increase. Imports of European newsprint into the United States declined 12,000 tons during the first two months of this year, as compared with last, so that talk of the market being over-stalked is not warranted by the facts.

"Consumption is well up to the average. A group of representative Sunday newspapers in the States averaged 100 pages in March, the highest since October, 1923. A similar group of dailies averaged 28 pages for the first three months of 1924, exceeding the number for the corresponding period of 1923. Advertising ran about 3 per cent more than last year.

"At the meeting of the American Pulp & Paper Association in New York last week the suggestion that a break in the price of newsprint was probable was ridiculed by the newsprint manufacturers as entirely groundless. There have been no decrease in the costs of production, it was pointed out, and the tendency both as to wages and to wood costs is toward a raise rather than a fall. The costs of woods operations during the last winter were higher than at any time since 1920. There is less spot paper available than at any time since 1920. There is less spot paper available than at time for months, and the price of this is holding up well. There is no abnormal supply in the hands of the consumers, nor is there any strong demand on the part of newsprint publishers for a lower price. The publishers are said to be realizing very fully that the stabilized newsprint market of the last two years has contributed very largely to their own satisfactory business, and they do not desire to see the situation disturbed.

"No Canadian newsprint manufacturer, so far as I am aware, has reduced his contract price, or is contemplating doing so, nor is there any reason to anticipate such a development in the near or remote future. The mischievous rumors that have been going around have evidently been put out for a purpose, and while their effect is annoying, they are without foundation of the slightest authority."

* * *

Rothermere Explains

Lord Rothermere, the well known English publisher, when in Montreal recently threw a little light on conditions that are affecting the Canadian export trade in pulp. He said that it was impossible to sell Canadian pulp in Europe just now. The low value of sterling in terms of dollars, made this impossible, and this was quite evident from what had happened to Chicoutimi. The simple truth was that the low value of European currencies in terms of Canadian dollars made the Canadian price too high. As far as Canadian newsprint was concerned, he considered the prospect bright and believed that Canada would capture 80 per cent of the American market within the next 10 or 15 years. This was not an unwarranted prediction, for already Canada was supplying about 50 per cent of the American demand. Asked if there were any danger of Russia, with political quietude restored, becoming a dangerous competitor of Canada, Lord Rothermere considered this quite improbable. While Russia's supplies of pulpwood were undoubtedly great, they are largely inaccessible. However, there might be some competition in chemical pulp produced from the forest areas on the shore of the Baltic.

* * *

International Paper Rallies

International Paper has recently rallied with the remainder of the list on the New York Stock Exchange. There is something more back of the advance in this stock, however, than an oversold condition. Paper common has never responded as it should have to the favorable 1923 earnings statement, which showed the equivalent of $11 a share for the junior issue. There are those who declare that the 1923 record of the company shows that it has turned the corner as regards profits and that it will never again run into such a period as that of 1921 and 1922, when it had to absorb heavy inventory losses. Entering 1924 International Paper had floating debt of nearly $12,000,000. So far this year the company is reported to have pared this item down to about $8,000,000.

* * *

Granted Charter

The Henry Rose Company, Boston, Mass., has been granted a Massachusetts charter to deal in paper stock, linters, and cotton waste with an authorized capital of $50,000. Henry Rose, 77 Walnut Street, Roxbury, is president and treasurer of the concern.

* * *

To Build Addition

The Oxford Paper Company, Rumford Falls, Maine, will build an addition to their paper mill to cost $150,000. The company is busy and reports a substantial order balance.

* * *

Cary Heads Company

The Worcester Paper Goods Company, 40 Foster Street, Worcester, Mass., recently organized to deal in all kinds of paper goods, is headed by Robert S. Cary, 125 Hillcroft Street, Worcester.

Mills Have Plenty of Water

Due to the exceedingly warm weather which has caused the snow in the North to melt and the few spring rains is the result of the present high stage of water in the Wisconsin River.

A short time ago most every mill on the river was suffering from lack of water, some even being forced to shut down for one or two days a week, and it is now necessary to sit sadly by and watch enormous quantities flow over the dams and through the gates. Lack of rain last fall sent the water in the reservoirs controlled by all the power users on the Wisconsin River to an exceedingly low level and they now contain only 7% of their normal capacity. In March only 12 inches of snow was reported north of Wausau a condition which indicates that the stream may not be severely taxed by surface water running off.

At the present time all of the plants are able to handle this high stage of water by use of their tainter in the dam, some of the users only using one-half of their equipment to control the situation.

Grinders, as well as electrical units are being run to full capacity which will keep all the mills in the Wisconsin River Valley in full production from this time on as they will all be able to grind enough wood to make groundwood for their requirements.

It is not expected that the river will reach a flood stage this year nor will there be enough water at any time which will necessitate a shut down to any of the mills on account of high tail water forcing any of them to close. If this water had only been available through the early spring and winter just passed all of the mills in the valley would have been able to run.

* * *

Short Newsy Items

The San Francisco Paper Company has moved from South Manes Street to 263 7th Street, San Francisco, Cal.

The Rose Paper Company has engaged in business at 229 Clare Street, San Francisco, Cal.

The new administration building of the Pioneer Paper Company, 55th and Alameda Streets, Los Angeles, Cal., is to be finished within 90 days, at a cost of $50,000. This company has just added three men to its list of experts. J. D. Beatty has taken charge of the felt mill, as superintendent, having had 25 years' experience in the manufacture of felt and building papers. C. W. Conant, an authority in the production of slate-surfaced shingles, with 17 years experience, will become production manager in that department; and G. H. Campbell joins the technical staff as chemist, being a specialist in properties and reactions of asphalt and oils.

The Gate-Burns Paper Products Corporation, has been chartered in Los Angeles, Cal., with a capital stock of $200,000, by A. E. Gates, John J. Walther, R. J. Burns, J. P. Newell, and W. D. Curtis.

The Hale Paper Company has been incorporated in Kansas City, Mo., with a capital of $10,000, by R. F. Wood, Virgil A. Hale and others.

The Ramier-Hall Wax Paper Company, 1200 Shrine Building, Memphis, Tenn., has been incorporated with a capital stock of $50,000, by J. F. Ramier, R. W. Hall and others.

The Southern Pulp & Naval Stores Company, is soon to build the first unit of a 50-ton pulp mill on the deep water harbor of St. Andrews bay, near St. Andrews, Fla.

* * *

Must Take License

The Ontario government now stipulates that all new lumber, pulp and paper mills must take out a provincial license before they begin operations. This action has been taken with a view to preventing the undue multiplication of mills beyond the capacity of the demand to take care of the product.

Established 1886

Looking Both Ways

Some organizations look backward, because they have nothing to which they can look forward. Some look forward because they have nothing inspiring in retrospect. Some live only in the present because they have had no past and are apparently without any future.

For thirty-eight years, regardless of prosperity or depression, the business of M. Gottesman & Company has steadily increased. The most gratifying feature is the fact that most of our business is from customers who have been on our books more than a quarter of a century.

This has a definite meaning for every buyer of Bleached and Unbleached Sulphite, Kraft and Ground Wood Pulp. For in this age of keen competition, only leadership that is based upon the highest integrity, service, quality and fair dealing, could remain so long unchallenged. This organization recognizes in its past a clearly defined responsibility for the future. The high ideals and sound methods have and will be steadfastly maintained.

O'CONNELL PREDICTS RUINATION

Unless Imports of Paper Are Curbed in Reasonable Time

THE ruination of the paper industy in the United States is threatened by foreign manufacturers, who are permitted to dump their products into this country at a price to the consumer far below what it can be manufactured for in this country, according to John H. O'Connell, general manager of the Diana Paper Company at Harrisville, and well known throughout northern New York and Canada as an authority on the importation of paper into this country.

"If this competition continues much longer, the paper manufacturers of this country might as well shut up shop," said Mr. O'Connell, in discussing the subject recently. "I have personally experienced this competition in several instances and at all times I have had to give way to it, as the price of the foreign product delivered was a great deal less than what we could manufacture it for."

"I approve of the vigorous campaign that is being carried on to bring the matter before the authorities at Washington and show them the unfairness of this foreign competition that all manufacturers in this country are up against at the present time."

"All paper manufacturers should co-operate to see that this competition is immediately eliminated in order to give all a fair chance for a living as it is absolutely unfair to have us pay a high rate of taxes to do business and then be confronted with such conditions."

The foreign paper is being brought into this country in such quantities that some of the weaker companies are facing bankruptcy unless something is done. Many domestic manufacturers favor the plan of Attorney Henry A. Wise to compel a careful Classification of all foreign paper that is brought in.

It is declared here that many purchasers of the foreign paper have found to their sorrow that they have received stock of an inferior quality and then have been unable to get any redress for the manufacturers would not take it back nor would they return the purchaser's money.

The quality of the foreign product is said to be of irregular quality. Some shipments of it have been fairly good and others have been so poor that the paper would constantly break on the presses.

New Firm Starts

The Economy Service Corporation, 1511 S. Sangamon Street, has been incorporated to manufacture and deal in paper and paper products, specializing on a new fixture for dispensing paper napkins in restaurants.

The capital stock of the new company is $50,000 and the incorporators are Elmer C. Morris, Emil Schoemann and Edward Perrizo.

The new fixture, which will be manufactured by the company has been received already with much favor by restaurant owners throughout the country.

It automatically dispenses folded paper napkins and is of great advantage in that it saves from 10% to 50% on the use of napkins in restaurants where installed. The device is being used at some of the John R. Thompson restaurants and the Raklios System.

The Economy Service Corporation is distributing this device and its other products through paper jobbers throughout the United States.

ROBERT WARK PASSES AWAY

Superintendent of St. Regis Paper Company Dies from Pneumonia

ROBERT WARK, aged 52 years, superintendent of the St. Regis paper mills at Deferiet and well known among paper manufacturers of this country, died at his home last week after an illness of about two weeks. During that time he had suffered from an attack of pneumonia.

Mr. Wark became associated with the St. Regis Paper Company four years ago last fall. At that time he was employed by the company as power boss. He came to the local paper company from East Angan, Canada, where he had served for about a year as superintendent of a paper mill. After serving for a short time as power boss Mr. Wark was promoted to assistant superintendent to the superintendentship. In that capacity he served until the time of his death.

Robert Wark was born, February 28, 1873, in Montreal, Canada, the son of the late Robert and Janet Morrison Wark. He received his education in Montreal schools and at an early age entered the papermaking industry. While a young man he served his apprenticeship as a machine tender but 36 years ago came to this country and entered into the same business in which he had been engaged in Canada.

His first position in this country was as night superintendent of a paper mill at Wilder Vt. He was with the paper company there for about 20 years and during that time served in the capacity of night superintendent. While a resident of Wilder he became affiliated with the Masonic order at White River Junction, which was only a few miles from Wilder.

From Wilder, Vt., Mr. Wark went to Glens Falls, where for the next two years he served as assistant superintendent for the paper mill of the Finch-Prynn Company. From Glens Falls he went back to Canada and St. Raymond where for the next eight years he served as superintendent for the News, Pulp and Paper Company at St. Raymond.

After completing eight years of service in St. Raymond, Mr. Wark went to East Adgan, Canada, where he served for a year as superintendent. From East Adgan he returned to this country and entered the employ of the St. Regis Paper Company at Deferiet.

Mr. Wark was a member of the First Presbyterian Church, of the Masonic Order and of the Knights of Birmingham.

Mr. Wark leaves his wife, to whom he was married 15 years ago, two brothers and a sister.

The remains were removed to Montreal and the St. Regis Paper Company at Deferiet.

* * *

More Mills Rumored

It is understood that American pulp and paper capital is being interested in the locating of mills in the Lake Winnipeg district. The Seamans interests of Chicago are believed to be among the number. The McArthur enterprise at Fort Alexander is taking quite a while to get under way, but it is now believed that it will come through all right.

* * *

The Heaviest Cut

Last winter's cut in the forests of Quebec was one of the heaviest recorded in recent times. Over 3,000 lumber camps have been in operation, employing nearly 25,000 men. The Department of Lands and Forests has had men engaged in patrolling the forests in certain portions of the province, mostly the western part, which is regarded as the most dangerous. These men in addition to doing their own special work, have been checking up on lumber operations and reporting to the department.

PORTABLE PUMPS USED IN FIRE FIGHTING

Experiment Proves Success In State of Washington Recently

A RECENT demonstration of the fire-fighting value of eight pumps was witnessed near Longview, Washington, by approximately 200 men, representatives of national and state forest agencies, and officials of leading timber companies of Washington and Oregon.

"The demonstration showed amazing progress in portable firepump construction," declared George H. Cecil, district forester. "I predict that thousands of dollars will be saved annually by the use of mechanical means to fight fire. Three years ago they were impracticable, now they are the greatest weapon we have against forest fires."

The eight machines weighing from 37 to 150 pounds were set up near a small stream at the base of a hill several hundred feet high. From their positions they threw long streams of water up the hillside. In a pressure test the machines forced water through a hose to the top of the hill. A 52-gallon barrel was stationed at a 300 feet height and one of the machines forced a stream through 1,450 feet of hose and filled the barrel in three minutes and fire seconds. The tests included pressure, height, hose connections and time for filling hose.

These machines are so designed that they can be taken by a forest ranger or a pack horse to a stream near where a fire has been located and used from the stream to put out the fire. A relay of pumps can be used if the fire is a considerable distance from the stream.

"For a small investment portable machines are among the greatest protectors of forests," declared Roy F. Morse, general manager of the Longview division of the Long-Bell Company. "Timber is the greatest resource of the northwest and every move to prevent fire waste is commendable."

"Oregon, Washington and British Columbia are the districts in which these pumps have been developed," said Shirley Buck, who was in charge. "We feel that the tests have demonstrated great progress in their construction, and that the fire danger in the forests will be materially lessened by their general use."

Lumbermen and chief owners of timber in Washington and Oregon expressed themselves as favorably impressed by the demonstration with the value of portable firepumps for fighting forest fires.

The machines demonstrated were: Northern Fire Apparatus Company, two machines; Fairbanks-Morse; Wonder Pump; Evenrude, two machines; Pacific Ross, two machines.

To Visit St. John

Lord Rothermere, the noted English publisher, who is so heavily interested in the Canadian pulp industry, will, it is reported, visit the Lake St. John district during his stay in Canada. This, as is well known, is the district in which are to be found some of the largest pulp and paper operations in Canada. As a result of his visit final decisions will be reached with respect to the new mills of the Gulf Pulp & Paper Company, which are to be built at Sillery, near Quebec city, for the working up of the wood purchased on the Manicouagan limits. It is estimated that from $5,000,000 to $8,000,000 will be spent on this large plant. The necessary power for operating purposes will be secured from the Shawinigan Water & Power Company.

“ELECTRO” STEAM BOILERS

(Kaelin development)

WILL SAVE YOU MONEY

IF
- You are generating or paying for electric power that is not being used.
- You have “DUMP” power or water running to waste.
- You need steam or hot water over week-ends.
- Cheap power available—either continuous or off peak.
- You contemplate new plant where hydro power available.

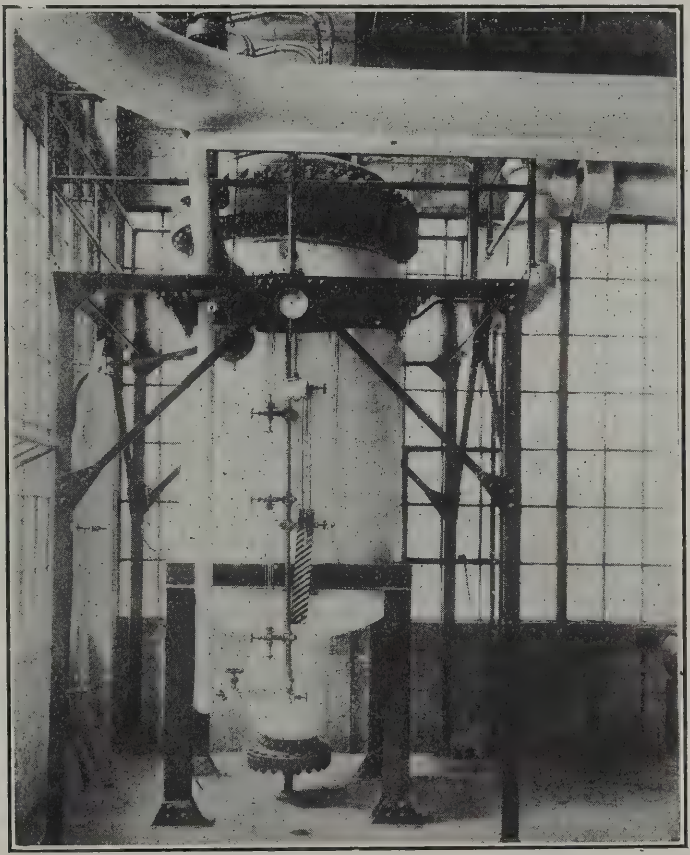
Uses high tension alternating current.

Thermal efficiency over 98%.

No chemical treating necessary.

Any ordinary boiler water satisfactory.

Low initial cost and maintenance.



5000 KW ELECTRO Steam Boiler, operating on 2200 volt, 3 phase, 60 cycle circuit, installed at Washington Pulp & Paper Corp., Port Angeles, Wash. (V. D. Simons, Engineer), by Electric Furnace Construction Co., Philadelphia.

Minimum space occupied.

No fumes, dirt, coal, oil, dust or ashes.

Unity power factor.

Almost automatic in operation.

Highest temperature that of steam.

Over 250,000 K.W. (25,000 B.H.P.) Now Operating

174,000 K.W. (17,000 B.H.P.) Now Under Contract

ELECTRIC FURNACE CONSTRUCTION CO.,
1015 Chestnut St., Philadelphia, Pa.

PROTEST EMBARGO ON PULPWOOD

United States Mills Will Seek Other Sources of Supply Rather Than Move Plants to Canada

A MEMORANDUM has been filed at Ottawa, with the Royal Pulpwood Commission on behalf of the pulp and paper manufacturers of the United States, asserting that it would be preferable to seek new sources of supply in the United States or abroad than to move the American mills to Canada in the event of an embargo on the exportation of pulpwood.

"The moving of American mills to Canada would either involve the scrapping of large investments in the United States or duplicating a part or all of them in Canada" the memorandum said, adding that "the growth of this industry will be the result of economic laws and not the statute law."

It also pointed out that about 90 per cent of the Dominion's forest area was publicly or crown owned and asserted that from the standpoint of conservatism of forest resources the embargo would seem "absolutely useless" because of restrictions against exporting wood from the public lands.

The proposed embargo would affect only 1.7 per cent of the total lumber cut, the memorandum said, if farmers' and settlers' lands were exempted as provided by an order in council passed last year.

At hearings before the Royal Pulpwood Commission the Canadian Pulp & Paper Association, declared itself emphatically in favor of an embargo, whereas the pulpwood dealers are no less emphatically against it. The farmers side with the latter; but they would not have the least objection to the embargo if they were assured that the Canadian mills would take the wood they are now exporting across the border at the same price that is being paid by the American mills.

F. N. McCrea, M. P., president of the Brompton Pulp & Paper Company, declared himself in favor of an embargo on wood cut on Crown lands (which already exists in several provinces), but against extending it to freehold limits, on the ground that it would be an unwarranted interference with private rights. F. J. Campbell, manager of the Canada Paper Company, refused to commit himself directly insofar as the embargo was concerned, but he contended that if pulpwood and woodpulp were allowed to cross over to the United States the same conditions should apply to book paper and other miscellaneous papers manufactured in Canada.

In the meantime the exports of pulpwood to the United States have declined considerably, showing that American mills are not very greatly alarmed at the likelihood of the embargo.

* * *

Makes Good Showing

The St. Maurice Paper Company owes much of its favorable showing in 1923 to the strong market for groundwood pulp that has existed in the United States. This company has an excess production of 100 tons a day over its own needs, and was able last year to market this readily at good prices. This, in addition to steady newsprint production and sales, enabled it to show an operating profit of $1,255,413, as compared with $696,594 in 1922. After allowing for depreciation this was equivalent to about 12.76 per cent, as compared with 5.63 per cent in 1922. The market for groundwood is not now as good as it has been, but the company is determined not to take chances on the wood pulp market. So it has planned to install new machines that will take care practically of its excess production of 100 tons a day of groundwood pulp and 70 tons of sulphite.

Wisconsin Mill Notes

Sprinkling systems are being installed in the two plants of the Peshtigo Paper Company at Peshtigo, Wis. The work, which was temporarily abandoned last fall, is being completed under the direction of Eugene Teeter.

E. Lambrecht has been elected president of the Employes' Mutual Benefit Association of the Hummel and Downing Company of Milwaukee, manufacturers of paper and boxes. F. Kleiber is vice-president, and F. W. Collins, secretary and treasurer. Directors are G. Ponik, C. Baier, Anthony Hart, F. Massman, A. Walker and Nell Fletcher.

Douglas E. Bishop, formerly connected with the Peshtigo Paper Company, recently was made superintendent of a new mill at Plattsburg, N. Y., according to reports in Peshtigo where he is visiting. He is preparing to take his family east.

The Yankee Paper and Specialty Company of Neenah has taken out a permit for an addition 30 feet wide and 50 feet long, to be built on its property on De Pere Street. The addition will be used for warehouse purposes, it is reported.

The S. and S. Paper Products Company of Cudahy has been incorporated with a capital stock of $100,000.

* * *

Improving Locks

During the last winter considerable improvement has been effected by the government on the locks in the village of Kimberly and in the vicinity of the mills of the Kimberly-Clark Company. New gates have been installed and are expected to be ready for the opening of navigation on April 12. Raising of the banks all along the canal will prevent water overflowing during the spring flood season in the future, it is expected.

* * *

Annual Report Out

Pacific Burt Company's fiscal year ended on April 1 and the annual report will be mailed out from Toronto to the shareholders in the course of a few weeks. The quarterly statements during the past year have shown that earnings have been well maintained and were even considerably ahead of the corresponding periods of last year. Profits amounted to $235,999 for the year ending March 31, 1923, and this was the largest experienced in the history of the company. It is stated that business conditions on the Pacific Coast have been very satisfactory for the company during the past year The sales during the final three months of this year were well ahead of the corresponding quarter of the preceding year.

* * *

Gets Appointment

The Canadian paper trade last week were interested in the appointment of A. A. Mulholland, of Toronto, to a place on the Toronto Board of Harbor Commissioners. Mr. Mulholland, who is widely known in paper manufacturing circles, was formerly a resident of Campbellford, Ont., where he was president of the Northumberland Paper Company.

* * *

Again at Capacity

The Nipigon Pulp and Paper Mills, Limited, which established a groundwood pulp plant of 70 tons capacity at Nipigon, Ont., and afterwards went into liquidation, changed hands some time ago and is now operated by the Nipigon Corporation, Limited, at Nipigon. The plant has been completely overhauled and is running at full capacity.

SAFETY CONTEST ENDS IN BLAZE OF GLORY

Tie at Kimberly-Clark Company Ends With Yellows in the Lead

THE Yellow division has been declared winner in the great safety contest conducted in the Kimberly mill of the Kimberly-Clark Company, the competition having closed on March 31. The contest was originally planned to run to March 1, but a tie developed. During that time the Green division had one off time accident which broke the tie. At the end of the contest the Yellows were leading by three points. The Kimberly mill will continue its safety work in an effort to land the world's safety record now held by the Niagara mill of the same company.

Officials and employes who co-operated in the contest feel that they accomplished the purpose for which it was arranged. They have installed into the employes of the mill the spirit of safety and have made each individual feel that he should be a champion of safety.

The Green division was the last to stage a program in the contest. It took place at the clubhouse and was the most exciting and forceful of any in its lesson. A fire scene was staged to show some of the dangers which are caused by fire. The chairman reviewed disastrous fires that had visited the Kimberly-Clark mills. Then came a fire scene. A small red schoolhouse had been built on the stage. The teacher rang a bell to summon pupils to classes. They assembled and while they were busy with the opening exercises the janitor was busy about the school cleaning. The teacher informed him there was no drinking water, the pipes being frozen, and he began thawing them out, using a blow torch. Suddenly teacher and pupils rushed from the building crying "fire."

A fire alarm was sounded, bringing the fire department. A student in the meantime rushed back into the building to get his books. He was trapped and suffocated by smoke before he could be rescued. This gave an opportunity for an exhibition of artificial respiration methods. A fireman, overcome, was treated with a lungmotor.

To conclude the practical demonstration of fire hazards Chief George P. McGillan of the Appleton fire department, who has charge of the Kimberly mill fire squad gave a talk explaining artificial respiration and reviewed fire dangers that could be avoided by taking precautions.

Programs will be put on in the mill from time to time to keep up the spirit, it was said, although the contest has officially closed.

* * *

Dies Suddenly

In excellent spirits and apparently recovering from a week's illness, Mrs. Albert F. Meisterhaim, 1023 Egleston Avenue, Sunday morning, urged her husband and two sons to hasten or they would be late to Palm Sunday services. Only a few mintues more than an hour later, the three hurried from church in response to an urgent call and reached home as the wife and mother was breathing her last. She was a victim of heart trouble.

She is survived by her husband, two sons, Carl and Philip; her mother, Mrs. Anna Baumann; four sisters, Mrs. E. C. Winburn; Erie, Pa. Mrs. H. H. Neumaier, Mrs. Frank McAllister and Mrs. Eugene McAllister, Kalamazoo and one brother, N. J. Baumann of this city.

Albert Meisterheim was for years purchasing agent of the King Paper Company. Leaving that position, he organized the Kalamazoo Trading Company dealing in paper stock and rags. In this line he has been very successful, and within the last two years has purchased from the Bryant Paper Company the plant, formerly owned by the Gumbinsky Brothers and operating both plants under the Kalamazoo Trading Company.

The Paper Can Industry

By W. R. LENDERKING

Vice President and General Manager, Purity Paper Vessels Co., Newly Elected President American Association Paper Specialty Manufacturers

In discussing the subject as represented by the title of this article it could perhaps be truthfully said that the term "Paper Can" covers a multitude of sins. Unfortunately, the industry is in such an embryonic state that when one makes mention of a "Paper Can" it does not convey any particular meaning. I don't believe that the layman has any definite picture in mind when someone from the trade begins talking of a Paper Can and the question, "Just what do you mean?" would be a very natural one.

The use of metal containers, dating back for hundreds of years, even to the time of the Egyptians, has gradually brought about the use of the word CAN. Consequently, when the word CAN is used today the first thing that is thought of is some sort of a metal container, be it square, oblong, round or any other shape. Consequently, some descriptive word is usually used at the same time that anyone would make use of the word CAN.

Now certainly "paper" is a very general term, and even the layman's point of view when the word paper is used is somewhat limited. The layman knows a box by it being a shoe box, a sugar box, or a cracker box, but he does not know that it is chip board, news board, straw board, patent coated, etc., so that when the term "Paper Can" is used, very little is known as to just what is being talked about.

Through the slow but orderly processes of development, a great many types of paper CANS have come into use and perhaps the first of these to be used generally is the chip board container with ordinary drawn covers that is commonly represented by the container used for table salt. This container came into more general use after the development of spiral-winding machines in the early 1890s, and it seems that the spiral-winding method produced tubes cheap enough to make the product commercial. This same type of container is seen in many sizes in the drug-store for the packing of all sorts of dry and powdered drugs. But these containers are called "Paper Cans," and I believe wrongly so.

Then, of course, there are the many kinds of containers with paper side-walls and a metal friction top cover also referred to as "Paper Cans." There should be some distinctive term applied on the part of the manufacturer of these various products so that anyone, regardless of who it might be, could readily understand just what was being talked of by the mere mention of a descriptive word along with the word CAN. In order for everyone to know just what I am talking about, I am going to say that my article will deal chiefly with the cylindrical-shaped liquid-tight paper containers also called "Paper Cans."

W. R. LENDERKING

As far as I know, the first container of this type was produced by Charles Marthinson at Washington, D. C. I am told that Mr. Marthinson was engaged extensively in the lumber business and before retiring he desired to devote his effort toward the production of a commercial paper container that would hold liquids. His connection with such a proposition in their minds and patents were issued on various combinations of attaching the bottom to the side-wall. Mr. Marthinson was undoubtedly the first to get into the actual manufacture.

I don't know whether any of his containers were actually produced the year that his original patent was granted, namely 1909, but in 1910 some few containers were manufactured and he applied the trade name of Purity Paper Bottles to his product.

In the construction of this container the tube was made spirally wound from two-plys of manila board and carefully paraffined. The bottom was put into position by a special crimping process which was later called "locked-crimping," and no glue or other adhesive was used in applying the bottom to the side-wall. Through the locked-crimping process an absolutely liquid-tight joint was made.

So far as is known, the first use for these liquid-tight containers termed Purity Paper Bottles was for beer. The containers were sold through jobbers in the Metropolitan District of New York, who in turn sold them to the owners of cafes. But since the word "cafe" has taken on a different meaning after Mr. Volstead got in his deadly work, we can perhaps say that the first of these Purity Paper Bottles was used by saloons for draught beer. In other words, anyone desiring to take home a "schooner" would not first have to scout around for a pitcher or CAN, but simply went into a cafe, made the purchase and it was put into a liquid-tight paper container. Of course, these containers were found to be very satisfactory, consequently they were used for other purposes but the principal use in the early days was by the cafe owner.

Now shortly after the first Purity Paper Bottle appeared on the market, a container for the same purpose was produced by the Single Service Package Corporation of New York City. The side-walls were constructed in the same way, being a spirally wound tube, but the bottom was not crimped into the side-wall. There was a depressed groove put in the wall and the bottom (a disc) laid against this groove, the paper of the sidewall being turned over until it came in contact with the disc to hold it in place.

Early in 1914 the Paper Vessels Company of Baltimore, Maryland, came into existence and its first efforts were on the manufacture of a conical-shaped liquid-tight paper container and designed exclusively for use by the dairy trade. Toward the latter part of 1914 the Company put on the market what was termed a Pavesco Paper Can and in constructing the bottom, a sealing disc as well as a flanged cap was used in order to render the container liquid-

OUR SERVICE

THE BEST SERVICE WE RENDER PAPER MANUFACTURERS IS NOT AS PRODUCERS OF ENDLESS FELTS AND JACKETS, THOUGH WE DO THAT WELL. IT IS IN PUTTING AT YOUR SERVICE OUR ACCUMULATED EXPERIENCE OF THIRTY YEARS AND A THOROUGH UNDERSTANDING OF ALL THE PROBLEMS CONFRONTING THE PAPER MANUFACTURER IN HIS DESIRE TO PRODUCE MORE AND BETTER PAPER AT THE LOWEST COST PER TON.

IN OUR MANY GRADES OF FELTS AND JACKETS YOU WILL FIND ONE OR MORE GRADES THAT WILL MATCH YOUR MOST EXACTING CONDITIONS.

AVAIL YOURSELF OF OUR SERVICES BY GIVING US THE MAIN FACTS ABOUT YOUR PRODUCT AND WE WILL RECOMMEND THE GRADE OR GRADES OF FELTS AND JACKETS THAT WILL HELP YOU TO SECURE THE BEST RESULTS.

THE ORR FELT BLANKET CO.

Piqua, Ohio

tight, this construction being the patent of Dr. Wilbur Wright, who was the Vice-President of the Paper Vessels Company.

In February, 1917, The Purity Paper Vessels Company of Baltimore, Maryland, was formed, taking over the Paper Vessels Company as well as the Purity Paper Bottle Company of Washington and the plants of the two organizations were consolidated in Baltimore.

Early in 1918 the Sealright Company came into existence, manufacturing cylindrical-shaped liquid-tight paper containers and operating at Fulton, N. Y. The Sealright container generally conformed to the types previously discussed in that the side-walls were spirally wound and the bottom was a combination of disc and flanged cap.

It was really not until this time that the general possibilities of the liquid-tight paper containers were realized and the general broadening of the field of consumption was then started. One by one new uses were found and I believe that it can safely be said that these cylindrical-shaped liquid-tight paper containers are known to everyone who purchases foods from the fish and oyster dealer, the grocer, the butcher, the delicatessen, the soda fountain and lunch counter, the restaurant, the caterer, the ice cream store, etc. Some of the products for which they are being used are as follows:

Oysters, crab meat, shrimp, pickles, olives, mince meat, chow chow, cottage cheese, jellies, honey, syrup, lard, nuts, tea, coffee, cocoa, spices, sausage meat, pigs feet, brains, salt fish, hamburg steak, chipped beef, liver, hearts, tripe, scrapple roll, cornmeal mush, hominy, butter, salads, soups, baked beans.

Of course, there have been other manufacturers who have started into the business of manufacturing the same type of liquid-tight paper containers, but this article deals principally with the early development.

That the development of these liquid-tight all paper containers has added something definite to the distribution of food products goes without saying. From a sanitary standpoint they have filled a long-felt want as so many articles of food are not really adapted to packages made of metal or partly of metal. The entire tendency of modern times is to Paper packages and certainly the liquid tight all paper container has contributed a goodly share to the march of progress.

I hope that if I have done nothing more than advance the thought that the word combination "Paper Can" does not mean anything, that this article will have been of value. Certainly it behooves all of the manufacturers of paper containers to find some way of identifying the particular type manufactured, so that each and every one coming in contact with them will know exactly what is meant in an instant.

J. E. WILLERT
Secretary of American Association Paper Specialty Manufacturers

TWILLER SALES TALKS

Exhibition and Exposition are different. Make a good exhibition, give a fine exposition.

* * *

The wandering eye gathers no knowledge, the intensive look absorbs information.

* * *

Talk for talk's sake is a dusty wind. The short incisive question gets the clear comprehensive answer.

* * *

Chairs and tables have legs, so have men. Chair and table legs are made to stand on. Men use theirs to get there with.

* * *

Pay your debt to the world with your best, but don't kick about where or through whom you are paying it.

Union Men Confer

During the next two weeks representatives of the unionized workers in Canadian pulp and paper mills will confer with the representatives of the latter on wages. In view of the fact that a reduction in newsprint prices is in prospect the indications are that the mills will stand for revision downward, instead of in an upward direction. It is understood that the Spanish River and the Abitibi Companies, two of the largest Canadian producers, with some American mills, will favor downward revision. Certainly there is nothing in the Canadian situation to warrant an increase.

* * *

Fred C. Clark, at one time in charge of the Paper Section of the U. S. Bureau of Standards, and more recently general manager of the Pejepscot Paper Company, at Pejepscot, Me., has become connected with the Hawthorne Paper Company, manufacturers of bonds and ledgers at Kalamazoo, Mich.

American Association of Paper Specialty Manufacturers

THE accomplishment of the forming of the American Association of Paper Specialty Manufacturers is of great importance to the paper industry. The ever increasing production of paper specialties is continually enlarging paper tonnage, therefore the paper manufacturer should be intensely interested in the association, as one of its objects is to increase the use of presently manufactured specialties and to always seek the creation of new ones to fit in the changing conditions of life.

The association is now functioning, it is of so much value to the Paper Specialty manufacturer that he should seek it. The secretary is ready to answer all inquiries.

The following are the officers: President, W. R. Lenderking of the Purity Paper Vessels Company, Baltimore, Md.; vice-president, Karl Becker, of the Westfield River Paper Company, Russell, Mass.; vice-president, Emil J. Hensen of the Fort Howard Paper Company, Green Bay, Wis.; secretary and treasurer, J. E. Willert, 152 West 42nd Street, New York City.

* * *

Is Made Manager

John A. Frost, for the past four years head of the purchasing department of the National Paper Products Company at Carthage, was last week promoted to manager of the sales organization, to become effective at once.

Mr. Frost succeeds J. J. C. Downey, who has been sales manager since 1920, who resigned last week. C. J. Roberts, assistant sales manager, also resigned his position with the National Paper Products Company following Mr. Downey's resignation.

Mr. Frost is a former resident of Watertown, and at one time was connected with the Watertown National Bank. His father was the late A. E. Frost, who was in the lumber business here for many years.

* * *

Denies A Rumor

Floyd L. Carlisle, of New York, former president of the Northern New York Utilities Company, last week denied that the rumor that was current to the effect that the Northern New York Utilities Company would take over the power of the International Paper Company at Glen Park and Brownville.

It had been rumored for some time that the Utilities Company would take over the two mills and use them as power plants. It was also rumored that the Utilities would take over the Sewall Island power. This, Mr. Carlisle did not deny.

* * *

Named General Manager

A. M. Irvine, who has been director of several companies operating in the Saguenay and Bay Chaleurs districts, including the Saguenay Pulp and Power Company and the Bay Sulphite, has been appointed general manager of coal sales of the British Empire Steel Corporation and its subsidiaries.

* * *

New Mill Starts

The new 100-ton paper mill which was erected at Kenore, Ont., by the Backus-Brooks Company, has begun operations. The first sheets of paper were turned out a few days ago and stood the test thoroughly. The paper is of excellent texture and the initial run was satisfactory in every way.

* * *

Incorporated for $100,000

The Sherman Paper Box Company, Inc. of Boston, Mass., has been incorporated with a capital of $100,000. The incorporators are President, Beatrice B. Sherman; treasurer, George Cummings, Cummings Road, Brighton, Mass.; clerk, Sanda R. Herron.

BUILT STRONG

there is no solder or paint about the scale. Standards are of black enamel, pendulums and discs are of white brass and baskets of heavy aluminum rod.

Selling and Salesmen

By J. E. WILLERT

Secretary Treasurer American Association American Paper Specialty Manufacturers

SELLING and trading are as old as the hills and will live so long as the world lasts. Mankind will always be demanding, its needs will ever be present. The meeting of these demands, the satisfying of these needs creates the employment of all the people. Each individual is engaged in some part of it, either in the production of commodities, selling the labor of their hands, the creative power of their brain, or in the distribution of commodities by their wit and ability, selling to each other. Every person sells something and the sale is made according to the power within the person.

Selling commodities or products of any kind is the work of an artist. The salesman to produce a finished work, the sale, must be endowed with talent and ability.

In the olden day when one commodity was traded for another, the need made the value and the basis of the trade. Wit and shrewdness were the determining factors of the transaction.

Present day trading requires more than wit and shrewdness.

Today the salesman must be incisive. not only must he knew human ntaure, he must be a psychologist, a psychoanalyst, a drawer of word pictures, a creator of ideas, a solver of problems.

His source of information must be wide, his fund of knowledge large, he must be prolific with ideas, fertile in suggestions, versatile, tactful, diplomatic, newsy in conversation, no historian, plausible in argument.

In disposition he must be optimistic, sympathetic, imaginative without being a dreamer or fanciful, full of veracity, confident, positive without stubbornness, loyal to himself and his position, dignified, not a sycophant.

He must be a student of the needs of the people, knowing the effect on humanity of the environment in which they live and their trend of mind.

All these attributes will be valueless unless there is a perfect coordination with the firm he represents and complete intimacy with their merchandise.

For the firm he is the ambassador, the intermedio, the prophet, from him the customer gathers the character of the firm he represents, visualizes it. The salesman's personality impresses itself so firmly on the customer that all the dealings of the customer with the salesman's firm will be governed by this impression. The salesman is the breath of the firm, their full expression.

This being the case he must so comfort himself that the customer will gain a lively respect for his firm and a perfect confidence in them.

His relation to the merchandise he sells must be a close one, he must have a firm belief in its quality, its selling virtues must be strongly imbedded in his mind.

There must be no partiality towards any particular item which he sells, but an even distribution of interest over all. Well balanced orders will be the result, a welcome condition, making prompt deliveries easy.

To know the population of a city or town, to get a true reflection of the people, a salesman should cultivate an investigating acquaintance with the employees of his customer, they should be friends, made so by the confidence they have gained in him through the veracity of his dealings and his helpfulness.

His continuous interest in the customer's stock, his carefulness in the recommendations and suggestions he makes on his customer's purchases is helped by his knowledge of city, town, neighborhood and people.

There is great danger in selling an article to a customer merely because it is cheap or special reduced to close out. Any article sold must surely fit the neighborhood, specials do not always fit and do not sell, thus causing a loss to the customer which may alienate him permanently.

Too much stress cannot be laid on the necessity of carefully studying a customer's wants and the needs of his trade. This is the cornerstone of a perfect customer following.

When the attributes of a salesman and the operation of practice which I have cited are closely linked in rhythmical movement complete selling success is sure.

High motive and dignified representation with intellectual grasp result in an efficient selling organization. Every sale deterrent is removed and certain confidence maintained.

Keeping pace with the world's progressive selling has become an art, a science. Great strides forward in civilization have followed the trader.

Selling and the salesman must remain on the pinnacle of integrity, stable, unswerving and sure, that commercial supremacy may be maintained.

Paper Machine Felt and Press Rolls

Selection and Proper Treatment of Papermakers' Felts—Functions of Press Rolls and Advantages of Soft Rubber Surfacing—Merits of Wooden and Stone Rolls

By HENRY F. OBERMANNS

General Superintendent, Hammermill Paper Company, Erie, Pa.

In this article, which is reproduced from the Wochenblatt fuer Papierfabrikation, for March 10, 1924, the general superintendent of the Hammermill Paper Company gives a good account of American mill practice with regard to the felts and press rolls used on paper machines making different classes of paper. The kinds of felts used in newsprint manufacture differ from those for the production of fine papers where felt-marks must be avoided. Some suggestive thoughts are expressed concerning the choice of material for top and bottom press rolls. The lower press roll works best when covered with soft rubber, a softer rubber being used nowadays than was the practice in former times. As to the choice of material for top press rolls, stone appears to be preferred, though soft rubber gives better results when the stock is in that condition known as free. Mr. Obermanns writes with a good practical knowledge of the subject and has brought out several matters of great interest to papermakers.

THERE is perhaps no article in daily use in the paper mill which is treated with so little consideration as the papermakers' felts. The average machine tender and unfortunately a great many superintendents as well, often fail to appreciate the many advantages that can be gained by the proper selection of the right type of felt as well as the proper treatment of the felt after it has been placed on the paper machine. Just as important as the proper selection of a felt is the proper selection of rubber press rolls which are to operate in conjunction with the felts.

Function of a Felt

What is the function of a felt on the paper machine? The most apparent purpose for which it is there is, of course, to guide the delicate, very wet sheet of paper through the presses, to act as a sponge, to absorb the water which is removed from the paper by pressure. Good felts must possess three very important qualifications; they must be strong enough to have good wearing qualities; they must be open so as to allow the water which is removed by pressure to pass through readily; they must have a good finish and surface so as to impart a good surface to the paper and to avoid felt marks which would cheapen the appearance of the paper produced by them. It is very difficult to combine these three features successfully in a felt, very often it becomes necessary to sacrifice one of the qualities in order to get the best results.

Essentials in Newsprint Manufacture

Again, we have to consider carefully just what grades of paper are to be produced with the felt in question. On paper machines making newsprint the essentials are high speed and production and thorough water removal. The latter is particularly important in locations where fuel is very expensive as every pound of water removed by evaporation on the dryers will cost from ten to twenty times as much as when this amount of water is removed by pressure in the presses. Felts combining strength with openness are therefore ideal for this purpose. This fact has been recognized by a number of the largest newsprint paper manufacturers in Canada who meter carefully the amount of water removed by each press. A felt is removed from the paper machine as soon as the amount of water removed drops to a certain minimum regardless of the physical condition of the felt.

Fine Papers Need Different Felts

Quite different is the analysis if we are considering the purchase of a felt for the manufacture of fine paper. While here of course, a certain amount of strength and openness is also needed, one of the most important features is perhaps the surface or "finish" of the felt so as to produce a sheet of paper of the desired surface and free from objectionable felt marks. The threads of wool in the felt cannot be twisted quite as hard, which means of course, lower strength.

At this point I wish to bring out the important part which the lower press roll, usually covered with rubber, plays. These rolls can, as a rule, be made out of considerably softer rubber than has been the practice in the past and by doing so stronger and more open felts can be used without producing any felt marks, while the life of the felt is at the same time very materially extended.

Use of the Plastometer

At this place I wish to say something regarding an instrument made by the Pusey & Jones Company, of Wilmington, Del., which is used quite extensively in this country; it is known as the Plastometer, that is, an instrument measuring the plasticity of rubber. The instrument consists of a vertical shaft ending on its lower extremity in a ball ⅛ in. in diameter. This shaft supports a weight of 1 kilogram, a weight which, when permitted to rest upon the rubber, sinks into it according to the softness of the rubber, the distance being recorded by a delicate micrometer. Rolls commonly in use on paper machines will show a density of 30 to 40 points. This means that the kilogram weight supported by the ⅛ in. ball sinks .30 to .40 mm. into the rubber.

Softer Rubbers Work Best

Newsprint paper manufacturers in recent years have experimented with softer rubbers up to .75 mm. density and while it became necessary to remove their rubber press rolls after every two weeks for regrinding, this expense was justified by the smoother operation of the paper machine and increased water removal. There seemed to be a limit of softness at which the rubber manufacturer was able to produce his rolls as the softer the rubber the quicker a roll would corrugate, that is, the rolls would not retain its perfectly round and true shape. About a year ago, however, the B. F. Goodrich Rubber Company, of Akron, Ohio, experimented with a new rubber compound and with my aid, experiments were carried on at the mill of the Hammermill Paper Company. These rolls were made of extreme softness, the ⅛ in. ball of the plastometer making a 1. mm. indention but the result on the paper machine was very gratifying. Rolls after six months service on the machine, showed absolutely no change either in their crowning or in their diameter and no sign of corrugation was noted after even this long running period. The felts have lasted 50 percent longer than heretofore, and felt marks in the paper were wholly eliminated, although the softer press rolls enabled us to use a very much stronger and more open felt. Today we have all of our machines equipped with rolls of this kind and while it would seem hypothetically that a softer roll should not remove as much water as a harder one, this has not been true in practice, as the more open felt which we are able to use fully compensates.

Treatment of Felts on the Machine

Now a little about the treatment of the felts on the paper machines as practiced here in America, and I feel certain that these things will be of interest to some of the German papermakers. Squeeze rolls for felt washing such as are used in Germany particularly for first presses, are never used in America. We, as well as other people, have tried them but the idea has never appealed to us. In American paper mills it is customary to shut the paper machine down every 24 hours during which time the felts are washed and other minor repairs made to keep the machine in the best physical condition.

One-Sided Felts

During recent years felts are being used more and more which have the soft woolen cushion only on one side, which means that the felts can not be turned over. It has, however, this advantage that the extra heavy cushion protects the heavier threads and felt marks are less apt to occur. I am also inclined to believe that the felts made in this manner last longer as the soft fluffy wool on the outside of the felt does not come in contact with as many felt rolls, or felt suction boxes all of which are located on the inside of the felt. Great attention is also paid to the condition of the felt-carrying rolls over which the felt has to pass. Wooden rolls are not now used, except perhaps on very small machines. Iron rolls are entirely objectionable as in course of time, they become pitted and corrode, and in this way materially aid in reducing the life of the felt. Felt rolls covered with brass and copper tubing are usually used, though in recent years felt rolls covered with hard rubber are coming more and more into use. These rolls are always smooth and render satisfactory service.

Trouble from Defective Worm

Usually one felt-carrying roll on each felt is replaced by a worm roll. In former times when small machines and wooden rolls were used a worm made of felt was tacked to the wooden rolls. Today copper-covered rolls with copper worm soldered to its surface are largely in use but here also rubber is gradually and satisfactorily replacing them. It is important, of course, that these metal worms do not have any sharp edges and that the worm is of a uniform and even pitch. I had an interesting thing occur in this connection about a year ago when on one of our paper machines the felts began to give out very persistently after only about 50 percent of the regular running time. Careful analysis at last brought out the fact that the worm roll on this particular felt had several months ago, been repaired in such a manner that the pitch of the worm was somewhat irregular. After replacing this defective worm with a new one our troubles immediately ceased.

Types of Press Rolls

As previously stated, rubber is usually used in this country for bottom press rolls, while for top press rolls chilled iron, wood, bronze, steel or rubber are employed. Wood makes a very satisfactory press roll and this perhaps is more extensively used particularly on the older machines. Hard maple is the wood usually employed. With the faster and larger paper machines it is getting more and more difficult to find logs of the proper soundness. One disadvantage of the wooden press rolls is that it is difficult to maintain good fitting doctors on the press rolls and that the press rolls also frequently have to be turned down in order to maintain a smooth surface. Chilled iron press rolls are still being used quite extensively, though the paper very persistently stick to them, particularly if the stock is somewhat "free." In recent years the stone press roll has made its appearance in this country and wherever this is used it is entirely satisfactory. On certain grades of paper, particularly book papers, where the condition of the stock is always rather "free," comparatively soft rubber rolls are used as top press rolls. If these rolls are pressed very hard the paper almost refuses to stick to the rubber and they are accordingly used quite successfully by a number of mills making book papers.

Crowning of Bottom Press Rolls

Nothing definite regarding the crowning of the bottom press rolls can be said, as that, of course, depends on the density of the rubber, the construction of the press roll body, and the width of the paper machine. I want to mention, however, that on a 100-in. machine with press rolls of 1.00 mm. plastometer reading I am obtaining the best results with a crown of about 45/100 in. in diameter.

* * *

Handle Most Wood

According to recent word from Morrisburg, Ont., the Waddington Pulp Terminal will handle between 50,000 and 60,000 cords of wood this season. A second conveyor, 750 feet long, and two drum barkers to take care of the rough wood, have been installed. The new conveyor will replace the old one blown down three years ago. Last year thirty-four vessels, with a cordage of 21,000 arrived at the terminal.

Scouts Make Profit

Boy Scouts of Kalamazoo Saturday netted about $100 in their second collection of paper in the cleanup campaign now is progress.

This paper is taken directly to the plant of D. Graff and Sons and disposed of in bulk. This is not sorted at all by the Scouts.

Turn to the Clearing House and Read Every Line—It Will Pay You

Report Is Made

The Dominion Bureau of Statistics has just published its review of the pulp and paper industry for 1821 and 1922. The British Columbia mills reporting show that in 1921 they consumed 225,240 tons of pulpwood or 10.3 per cent of the total for all Canada and in 1922, 274,649 tons which although an increase of material, showed a lesser percentage of the Dominion total, demonstrating that the increased B. C. production did not keep pace with the eastern provinces.

The following production table is part of the statistical report:

B. C. Wood Pulp Production

Kind of Pulp—	1921	1922
Ground Wood Pulp	89,348	100,483
Soda Fibre	.....	......
Sulphite Fibre, bleached	17,273	24,077
Sulphite Fibre, unbleached	51,544	63,997
Sulphate Fibre	6,888	9,869
Screenings	.....	.....
Total Tons (of 2,000 lbs.)	165,053	198,426

B. C. Paper Production

Kind of Paper—	1821	1822
Newsprint	92,594	124,555
Book and Writing Paper	.....	......
Boards	.....	......
Wrapping Paper	5,407	6,045
Total tons	98,001	130,600

* * *

New Plant at Longview

August F. Beisse, prominent contractor, will have supervision of the construction of the Pacific Straw Paper & Board Company's plant to be erected on the 15-acre site recently purchased in Longview's industrial center. Work will be started about May 1, according to Charles F. Schaub, who is president of the company.

Three units of the plant are to be built now at a cost of approximately $60,000. Machinery to be installed in these buildings will cost about $100,000.

* * *

Future in West

An editorial in a Portland, Oregon daily newspaper urges reforestation, making the statement that the last great coniferous forests of the continent are in the Pacific northwest.

The editorial says, "Reforestation looks toward the future. In this it is broadvisioned beyond the ordinary enterprises of man. Those who sow shall not reap, but the nation will. Idealism has entered the project. True, reforestation is profitable in a commercial sense, but the investment is so protracted that one may well conclude it to have been made out of humanitarian motives, or at least to assume that these enter largely into the plan."

* * *

Completes Her Contract

Mrs. Kate Bowerman, a lumberwoman contractor of Silver Mountain, Ont., was in Fort William a few days ago, after completing her winter's work and delivering 400 cords of wood to the Hammermill Paper Company. The wood was on her own property, and she took out the contract in the ordinary way, superintended the construction of her own camp, employed her gang of bushmen, put them to work, supervised the cutting of the pulpwood, and drove a team herself when any of the teamsters took ill. Mrs. Bowerman says that next year she will take out another contract, probably on a larger scale.

BOOKS— *for the Technical Worker*

SOME of the books which were on display at PAPER'S booth in the Paper Industries Exposition are listed below. Among these are volumes which will have a special appeal to different workers in pulp and paper operations. We are now taking orders for the books which will be sent postage paid on receipt of price.

FOREST PRODUCTS: Their Manufacture and Use, by Nelson C. Brown, Professor of Forest Utilization at the New York State College of Forestry, Syracuse University	$4.00
ELEMENTARY CHEMICAL MICROSCOPY, by Emile M. Chamot, Professor of Chemical Microscopy and Sanitary Chemistry at Cornell University	$4.25
GENERAL CHEMISTRY, Emphasizing industrial Applications of Fundamental Principles, by Horace G. Deming, Professor of Chemistry at University of Nebraska	$3.50
APPLICATION OF DYESTUFFS, To Textiles, Paper, Leather and Other Materials, by J. Merritt Matthews, Ph.D.	$10.00
THE TEXTILE FIBERS: Their Physical, Microscopical and Chemical Properties, by J. Merritt Matthews, Ph.D.	$10.00
AN INTRODUCTION TO THEORETICAL AND APPLIED COLLOID CHEMISTRY, by Dr. Wolfgang Ostwald, translated by Dr. Martin H. Fischer, Eichenberg, Professor of Physiology at the University of Cincinnati.	$2.50
CHEMISTRY OF PULP AND PAPER MAKING, by Edwin Sutermeister, S. B.	$6.00
FRENCH-ENGLISH DICTIONARY FOR CHEMISTS, by Austin M. Patterson, Ph.D.	$3.00
GERMAN-ENGLISH DICTIONARY FOR CHEMISTS, by Austin M. Patterson, Ph.D.	$2.50
WALL PAPER: Its Origin, Development and Manufacture, by George Whiteley Ward	$1.00
PAPER, by H. E. Maddox	$1.00
PRINTING, by H. E. Maddox	$1.50
PRINTING FOR SCHOOL AND SHOP, by Frank S. Henry	$1.50
THE MANUFACTURE OF PULP AND PAPER, a series of text books prepared under the direction of the Joint Executive Committee on Vocational Education of the Pulp and Paper Industry. Four volumes now issued	$5.00 each
ONE THING AND ANOTHER, by Judge Charles F. Moore. This book contains 200 pages of the Judge's wit and wisdom, printed on fine paper with a photogravure portrait of the Judge. His speeches and lectures are those of a philosopher, wise, kind and altogether good humored. Every man connected with the paper industry should have a copy of this book as a memento of "The best friend the paper industry ever had."	$10.00

Decker Cooking System

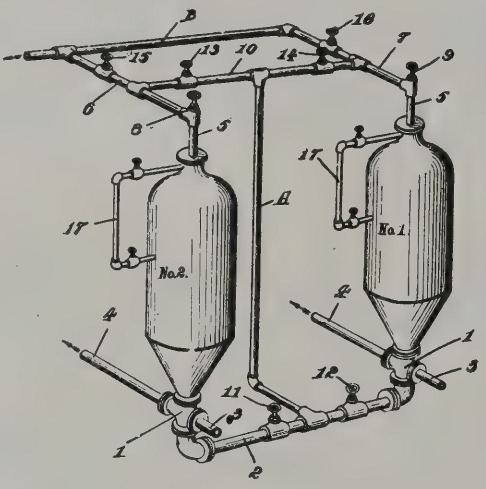
Particulars of a New Method of Using Relief Gases and Heat for Cooking Wood in a Series of Digesters

IN view of the discussion which has been carried on in some of the German paper trade periodicals concerning priority and validity to title of the patent taken out by Lemuel B. Decker, of Kenogami, Quebec, Canada, covering an improved method of cooking wood by the sulphite process, readers of PAPER will be interested in a statement of the claims made by Mr. Decker for his invention. It may be stated briefly that, while it is called a recovery apparatus, it is in reality a method of connecting up digesters in series in such a way that the relief of the first digester is carried over into the second and so on, as many as six digesters being connected in this way.

The accompanying illustration shows a pair of digesters connected as above stated. Mr. Decker represents his invention as being designed especially for the recovery of sulphur dioxide gas, relief liquor and heat in the process of cooking. As stated in the specifications of Patent 1,477,041, the invention is employed in connection with two or more digesters connected in such a manner that the gases created in one of them may be conducted into the other for use in a subsequent operation of the latter digester. Likewise there is an effective transfer of heat from one digester to the next one during the successive operations, as a result of which the apparatus recovers and conserves heat energy that would otherwise be wasted in the ordinary cooling system.

An additional feature of the invention resides in a means whereby all the digesters of the system are connected to an acid storage tank into which the gases given off may be conducted as desired. It is stated that in practice the apparatus gives a greater yield of No. 1 pulp per digester as well as a more uniform and better quality of stock. As illustrated herewith, the device consists of a pair of digesters indicated as No. 1 and No. 2 respectively. The coupling 1 into the lower openings of which is fitted a cross pipe 2 placing the digesters into communication at their lower ends. One of the lateral branches of each cross receives an acid supply pipe 3, properly fitted with valves or the like (not shown) for controlling the flow of acid thereinto. These pipes 3 may also be joined to a suitable steam supply as is already known in the art. The remaining lateral branch of each cross receives a discharge pipe 4 which communicates with a blowpit.

Each digester is provided at its top with an outlet pipe 5 communicating with the lead-off pipe B by means of the branches 6—7. The lead-off pipe extends to an acid storage tank (not shown). The outlets 5 are controlled by means of valves 8 and 9 fitted in the junctions between these pipes and the branches 6—7. A cross pipe 10 joins the two branches and communicates with the cross pipe 2 by means of a by-pass A connected into the intermediate portions of these pipes. The two sides of the cross pipe 2 are controlled by suitable valves 11 and 12, while opposite sides of the cross pipe 10 are provided with valves 13—14. Similarly the portions of the branches 6—7 rearward of the cross pipe 10 are fitted with the valves 15—16. The digesters may be equipped with gauges 17 for an obvious purpose if desired.



In operation, digester No. 1 is filled with chips and acid in the usual manner. Digester No. 2 is then filled with chips and ¾ full of acid. Steam is introduced into No. 1, thus raising the interior to the desired pressure in the usual manner. The valves 9, 14, and 11 are opened, the remaining valves being closed whereby hot acid and gas pass from digester No. 1 into the bottom of No. 2 through branch 7, pipe A and cross pipe 2. Valves 8 and 15 are now opened, valve 13 being kept closed, thus allowing the gas rising from digester No. 2 to flow into the lead-off pipe B and to the storage tank.

When the cooking process in digester No. 1 is finished, valves 9 and 12 are closed so that the product may be blown out through the discharge pipe 4. Valves 9, 14 and 11 are now closed, and the digester is filled with chips and a ¾ charge of acid instead of a full charge as in the previous instance. Digester No. 2 is brought to the proper pressure with steam through pipe 3. Valves 8, 13 and 12 are opened, valve 15 being closed, to allow the hot acid to enter the by-pass A, whence the acid gas enters the bottom of digester No. 1 for completing the acid charge therein. Valves 9 and 16 are now opened to allow the gases rising from digester No. 1 to flow to the acid storage tank. When the cooking process in digester No. 2 has been completed, the contents are blown off and the operation may be repeated in the manner described.

To Make Boxes

The Alfred Frost Paper Box Company, 448 High Street, Central Falls, R. I., recently organized under the laws of the State of Rhode Island to manufacture paper boxes of all kinds, is headed by Joseph Stenhouse and Charles L. Hawes.

* * *

Club House Opens

At the formal opening of the new club house of the Spruce Falls Company at Kapuskasing, Ont., E. J. Jones, general manager of the company, outlined the objects of the club and said that he hoped it would be the means of bringing about a proper community spirit. Mr. Shattuck, a director made the presentation of the building to the employees and in so doing said that the directors had but one request and that was that its facilities be used to the utmost capacity. Addresses were given by prominent municipal officials and others from various places in the district. The Spruce Falls Company are turning out 120 tons of easy bleaching sulphite pulp daily at its plant at Kapuskasing.

* * *

Operated at Capacity

The MacLeod Pulp and Paper Company at Milton, N. S., operated at full capacity this winter, the latter part of the season especially having proved very favorable to logging operations, permitting the farmers and small woodlot holders to get out and draw to the mill large quantities of pulp logs. The company will have 3,000 cords floated down the Liverpool River, from the hinterland, as far back as Maitland Bridge, Annapolis county. The S. S. Bornjholm loaded a cargo of pulp from the MacLeod mills, the first week in March, at Liverpool, for Brooklyn, N. Y. and will make regular trips between the two ports for the next two months.

Observes 97th Birthday

John R. Booth, the "Grand Old Man" of the Chaudiere, at Ottawa, veteran lumberman and pulpwood operator, and one of the monarchs of the timber industry in Canada, celebrated his ninety-seventh birthday on April 5. Mr. Booth, despite his weight of years, is a picture of rugged health. Undeterred by a recent illness which confined him to his home from December up to a couple of weeks ago, he is driving daily to the mills at Chaudiere—not in an automobile, but with a horse and buggy. He makes a daily inspection of the mills.

"The best friend the Paper Industry ever had—"

JUDGE CHARLES F. MOORE

Judge Moore has devoted much of his life to the Paper Industry. He has worked for it, fought for it and suffered for it.

He has helped the legislation that helped the Industry—fought proposed laws that were against it and clearly earned the summing up of one of the most prominent men in Paper—"The best friend the Paper Industry ever had."

The Judge was a wonderful orator. His speeches and lectures are those of a philosopher, wise and kind and altogether good humored.

But you will not hear the Judge again

He will not be able to mount the lecture platform again to amuse, instruct and inspire. He has worn himself out in service.

But his work will live. From his bedside his friends have brought his best lectures. They are printing them in a beautiful book. It is our purpose to sell these books for the Judge to help him who has helped so many.

You should have this book "One thing and another"

The book contains 200 pages of the Judge's wit and wisdom, printed on fine paper with a photogravure portrait of the Judge.

The contents include

Our Free Country
A Plea for the Average Man
The Optimist
The Panama Canal—How and Why Built
Back Where I Started
Why Boys Leave the Farm
Making Hay While the Sun Shines
Dollars and sense
Adam
Railroads
The New Jail
Dixie
Good Will
Golf
Contentment

We want every acquaintance and friend of the Judge, every man who is connected with the Paper Industry in any way, who has not already ordered this book, to send for one *now*. The price is $10. Nobody will profit from this but the Judge. We all owe him so much that the least we can do is to send in the filled-in coupon or write a letter with your check. We want *your* name on the list. Will you send it to us—now?

Every man connected with the Paper Industry should send for Judge Moore's book.

Write a letter or fill in the coupon below and send it to us with your check for at least one copy.

An Association Paragon

By **B. F. McBAIN**

WRAPPING Paper Manufacturers the world over seem about the same. All are fine and dandy good fellows, but they don't seem to have the confidence in each other they should have. They have too many organizations, however. About 50% belong to one, 30% to another and 20% don't just belong at all.

Too many of them have good cost knowledge but don't use it. Others don't know what their products cost and trust to luck that they are charging enough to come out whole, or a little better.

It would seem that it is about time for the Wrapping Paper Manufacturers of Minnesota, Wisconsin and Michigan to form an Association of their own, separate and distinct from any other association and get together regularly to their own good. If the law allows National Associations, it will allow like Inter-State Organizations and then those manufacturers who are competing in a certain market would have an association that should be worth while, providing they got the right sort of a man to manage it; one who knows the manufacturing game; one who would visit all of the mills of the Association at least twice each year and go over their costs with the Managers; one who would be confidential in every way as between the private business of the different mills; one in whom all the mills would have confidence; one who understands costs and methods of arriving at same; one who knows the places where the one great sin of all manufacturing, waste, is committed and one who could show each mill just what he makes at a profit and what he makes at a loss.

There are not many such men available but what such service would be worth to the Manufacturers of any section would be impossible to estimate.

We now have our Cost Associations, our Sales Association, our Association this and our Association that, but when you get right down to brass tacks what do they accomplish? True, they spend a lot of money and if gone after they will serve, but it is a case of go get it, if you expect to get your money's worth.

This would not be so of such an organization of the Lake States Wrapping Paper Mills as I outline above, and, in the end much of the present foolishness of the wrapping paper game could be eliminated.

Why wouldn't it be a good idea to get a bunch of manufacturers together and then send someone around to all the mills in the district named to get the names of all the mills on the dotted line, organized for efficiency in Manufacturing, in production, and in everything now before the Industry that is detrimental that in the end all may live.

Start Enlargement

Work will begin shortly on the construction of the first unit of a scheme of general development and enlargement of the plant of the Powell River Company, pulp and paper manufacturers of Vancouver, which will entail an ultimate expenditure of between $5,000,000 and $6,000,000 it has been announced by Norman Lang, managing director of the company.

Before the work of enlargement of the capacity of the big pulp and paper mills can be gone ahead with it is necessary to raise the height of the dam at the falls on Powell River and to increase the wharf facilities. Contracts approximating $600,000 have been let for these works and Messrs. W. C. Ditmars, Stuart Cameron and J. Connell, contractors of Vancouver, have been awarded the preliminary contracts.

The dam will be raised eight feet, providing additional water storage and power for an increase by 75 per cent. of the present capacity of the mills. The wharf will be 600 feet in length and slightly larger than the present docks.

It is expected that these undertakings will be completed within eight months.

In addition to the plant the company is spending large sums in town improvement. Forty homes have been constructed recently and there are 112 families on the waiting list for houses.

Hanna Again President

Mark A. Hanna, formerly of Watertown, and now residing in Cleveland, Ohio, where he is connected with a newspaper syndicate as well as the Champion Paper Company, was re-elected president of the Champion Paper Company at the annual meeting held in Carthage, N. Y., last week.

Other officers were re-elected as follows: C. H. Hanna of Cleveland, vice-president; R. B. Maltby of New York City, secretary and treasurer and C. T. Wright of Carthage, assistant secretary and treasurer.

In addition to the officers the board of directors is made up of F. P. Wadley of Watertown, George M. Seaman of Chicago and J. B. Seaman of New York.

Owing to the absence of the president and vice-president, the business was conducted by Mr. Maltby. Besides the election, the regular routine business of the organization was taken up.

Getting Much Pulpwood

An average of 20 cars of pulpwood a day is being received and unloaded at the Port Arthur Division of the Provincial Paper Mills. The Thunder Bay Company and the Fort William Paper Company are also receiving a large number of cars daily. It is believed that over fifty cars of wood daily are coming into Port Arthur and Fort William.

* * *

Already at Work

J. H. Black, of Toronto, president of the Great Lakes Paper Company, which is to commence a two million dollar newsprint mill at Fort William, and which has a groundwood plant under way, has completed arrangements for the booming of the pulpwood, having secured from the city the right to boom in front of the required properties fronting on the Kaministiquia River.

* * *

Planning New Plants

The International Fiber Board Company, Limited, which some time ago was burned out at Penetanguishene, Ont., and later reestablished a plant at Midland, Ont., are planning on the installation of another plant at the latter point but particulars have not been given out concerning it. The company are doing excellent business in fiber board products and it is stated that their present plant is not sufficient to take care of their expanding trade.

* * *

Recovers From Injuries

George C. Winlow, of Toronto, sales manager of the Lincoln Paper Mills, has so far recovered from the effects of injuries received in a recent train wreck at Bellville, Ont., as to be able to leave the hospital. His many friends in the paper trade were pleased to greet him again. Mr. Winlow will shortly leave on a business trip through the Canadian west to the Pacific Coast.

* * *

Plan For Meeting

Committees representing the Canadian Paper Box Manufacturers' Association have been meeting in Toronto recently making initial arrangements for the annual meeting of the organization which is to be held in Ottawa in June next. The gathering will bring together many men prominent in the paper box making industry from all over Canada and the United States. Efforts are being put forth to make the gathering the biggest the organization has yet held.

Something New For Pacific Coast

For the past six months Mr. B. T. McBain has been working with Western Engineers both Hydraulic and Civil, in the locating of a new pulp and paper mill project for the Pacific Coast, and his resignation at this time from the Nekoosa-Edwards Paper Company management at Port Edwards and Nekoosa, Wisconsin, effective July first is understood here to mean that he expects from then on to give his entire time to this new enterprise.

During the month of February Mr. McBain spent most of his time in the States of Washington and Oregon and returned with a large supply of surveys, estimates, blue prints and complete figures for the development of some water powers and maps of two manufacturing sites.

The representative of PAPER has talked with him and has been promised the first real story of his new proposition; which he has given us to understand will be part Eastern and the balance Western Capital.

The location, however, and the names of his principals, he cannot disclose at this time.

* * *

New Firm Organized

Savery-Shea Company, Inc., Stamford, Conn., was recently organized under the laws of the State of Connecticut to engage in the wholesale and retail paper business with an authorized capital of $25,000. Lester L. Savery, 97 Grove Street, Edward F. Shea, 4 Bell Street, and Kathleen M. Shea, all of Stamford, are the officers and principal stockholders of the company.

* * *

G. W. Wheelwright Dies

George W. Wheelwright, Glen Road, Jamaica Plains, Mass., head of the George W. Whelwright Paper Company, 70 Franklin Street, Boston, Mass., died at the Charlesgate Hospital April 12 in the 80th year of his age.

Most of Mr. Wheelwrights life was devoted to the interests of the paper industry; and he did much to improve his chosen business.

Mr. Wheelwright was a member of the Union Club. He is survived by a daughter and five sons. Mrs. Wheelwright died about one year ago.

* * *

Sherman Company Organized

The Sherman Paper & Box Company, Boston, Mass., is a recently organized manufacturing concern with a capital stock of $100,000. Beatrice B. Sherman, George Sherman, Cummings Road, Brighton, Mass., and Sanda R. Herron head the organization.

Paper Testing Methods
(1922)

A large edition of this handbook for paper mill laboratories was exhausted shortly after the type had been distributed. In view of the insistent demand the Technical Association has arranged for a republication and *Paper Testing Methods* is again available at $3 per copy.

The work covers detailed procedure for microscopical analysis, physical testing and chemical analysis of the paper with descriptions of the apparatus employed.

It is the only complete and up-to-date handbook on paper testing published in the English language.

It should be in the hands of every paper manufacturer and paper dealer as well as concerns who are large users of paper.

Paper and Board

New York, April 15—Convention Week witnessed no important changes in the paper market in New York. From all accounts there was a fair amount of business transacted between members of the trade during the week as local paper jobbers and distributors in quite a few cases took advantage of the opportunity to get together with mill officials and place orders in person, but, generally speaking, there was little development of other than routine character in the consuming market.

With the convention now a matter of history, it is more than probable that business in paper will undergo some expansion since it has become largely a custom for buyers of paper to hold off in instances where their requirements will permit just before the annual gathering of paper producers and jobbers in this city in anticipation of learning something about the market or manufacturing conditions from the visiting paper mill executives that will help to guide them in their purchasing operations.

Reports from the mill men attending the convention bore out the information recently obtained from local paper dealers and mill agents regarding market condition. Some kinds of paper, it was stated, are in good demand, with manufacturers amply supplied with orders warranting the operation of mills at close to full capacity,; on the other hand, a decidedly slack and unfavorable market exists for other descriptions of paper. In other words, buying is spotty, with demand reflecting the different situations prevailing in the various paper consuming industries, and with outside circumstances, such as the large importations of certain kinds of paper, having a pronounced effect on the market position of some papers.

The movement of newsprint continues on a heavy scale. As previously noted, publishers in New York and throughout the country are in the midst of their busy season at present, so to speak, and are using print paper in big tonnage. Department stores and other retailing establishments are utilizing immense areas of space in the daily press to attract the public to their counters during the period of pre-Easter and spring shopping, and most newspapers are printing issues of as many pages as their facilities will allow and even then are omitting some advertisements.

Newsprint prices are very firm, and while there is no change in the contract basis nor any likelihood for the first half of this year, according to announcements of the leading manufacturers, it is no easy matter for transient buyers to locate all the newsprint they want for quick delivery, nor are contract buyers finding it any too simple to augment their supplies by spot purchases, reflecting the sold up condition of a majority of print paper mills.

Fine papers are enjoying a fairly active demand. It is true that consumers are buying very conservatively but there is nevertheless a large and healthy movement from mills to consuming centres as a result of the busy situation in the printing trades. Prices of bonds and ledgers display a firm and rising tendency, and producers are not hesitating to mark up quotations on some lines, having plenty of justification for such action in the recent increase in raw material costs.

Coarse papers are relatively quiet although there has been improvement noted lately in the demand for both wrapping and tissue, while prices show a hardening tone. Book paper is moving in consistent fashion and in gradually climbing volume, with quotations marked by greater steadiness than in quite a while.

Building papers have slowed down but manufacturers say they expect April to be better tha nlast month. Box boards are in fair call and prices are firming. Plain chip is quoted at around $42.50 a ton f.o.b. New York, and news board at $45 and up in New York.

Mechanical Pulp

There is a broad range to quotations on mechanical pulp. It appears as if prices depend entirely on the position of the seller, of how anxious he is to effect sales, and also on the competitive freights from producing to consuming points. There have been reports of sales of domestic and Canadian ground wood at $30 a ton f.o.b. pulp plants and even lower, whereas some sellers are said to be asking and obtaining $35 a ton at shipping points for spruce pulp for prompt shipment. Imported ground wood is quoted around $33 or $34 a ton ex dock New York though sales at cheaper prices are now and then reported. Demand is fair but nothing out of the ordinary as far as tonnage is concerned, and indications are there is an ample supply of pulp, which explains in part the irregularity of quoted prices.

Foreign and Domestic Chemical Pulp

Signs point to a firming of prices of chemical wood pulp at primary sources, especially abroad. It is said that producers in Scandinavia are well sold up for this year and that, having but limited tonnage yet to be disposed of, they are in a position where they can insist on the prices quoted. At the same time, there has been no rise in quotations. The market is better stabilized on rather well defined levels, and the increased steadiness is attracting more paper manufacturers into the market to place orders.

Foreign unbleached strong sulphite is quoted from 2.50 to 2.75 cents per pound ex dock New York, and some large sales of this kind of pulp at such prices are reported to have been made for shipment ofter the opening of the Baltic. Swedish kraft also has sold recently in good volume at prices of between 2.50 and 2.60 cents a pound ex dock at Atlantic seaboard for No. 1 kraft. Quotations on bleached sulphite are steady, and tending to rise, the strike of pulp mill operatives in Norway having a strengthening influence. Prices ex dock New York and f.o.b. pulp mills follow:

Sulphite foreign—			
Bleached No. 1	3.75	@	4.25

Domestic Rags

There have been some few changes in prices of the different classes of papermaking rags, almost without exception in a downward direction. The trend of the market is unmistakably easier, as it usually is in the spring, and paper manufacturers are buying cautiously and principally against direct requirements, thereby indicating they expect still lower prices. No. 1 roofing stock is selling at about 2.15 cents a pound f.o.b. New York, and No. 2 packing at 2 cents f.o.b. this city. Only certain roofing felt mills are reported purchas-

				Roofing Rags, No. 2	2.00	@	2.10

Imported Rags

The market for imported papermaking rags has developed into a distinctively slow affair after the period of brisk business recently. Consumers seem to be fairly well supplied for a time and are noticeably holding off in further purchases, with the result quoted prices are moving downward. Dark colored cottons are quoted at around 2 cents a pound ex dock New York, with reports of some sales under this level. Quotations on an ex dock basis at this port are:

Lins., White, No. 1	15.00	@	16.00	German Linen, blue	5.00	@	5.25
Ger. Blue Cottons	3.75	@	4.00	German Linen, grey	6.50	@	7.00
French Light Blues	4.00	@	4.50	German S. P. F.'s	6.00	@	9.00
New Light Prints	7.00	@	7.50	German Light Prints	4.00	@	4.50
New Unbleached	10.50	@	11.00	Dk. Colored Cottons	2.00	@	2.10

Bagging, Rope, Etc.

There is a firm tone to prices of old rope and a steady movement of this article to paper mills is noted. Domestic manila rope is quoted at around 7 cents per pound f.o.b. New York, and foreign manila rope at 6.50 cents upward ex dock New York. The demand for old bagging is narrow, and prices are largely nominal. F.o.b. New York quotations follow:

Gunny No. 1	1.50	@	1.60	For. Manila Rope	6.50	@	7.00
Foreign	1.40	@	1.50	Domestic Rope	7.00	@	7.25
Wool Tares, light	1.40	@	1.50	Mixed Strings	1.25	@	1.50
Roofing Bagging	1.15	@	1.25	Scrap. Bagging, No. 1	1.40	@	1.60
Wool Tares, light	1.40	@	1.50				

Old Paper

Some improvement in the demand for certain grades of old paper has been recorded yet the market, as a whole, is still dull, with prices generally on the downtrend and with sellers seemingly anxious for business. Quoted prices bear little importance at present for the reason that consumers are most often securing the supplies desired at reductions, though it is apparent that market levels have eased to a point where dealers are hesitant about booking tonnage orders for certain grades in fear that a reaction may set in at any time.

Shavings are in slow call, hard white especially. No. 1 hard white shavings can be purchased at 3.75 cents a pound f.o.b. New York freely, and doubtless at lower rates, while No. 1 soft white shavings are quoted at 2.80 cents and less New York. Folded newspapers are bringing about 75 cents a hundred pounds f.o.b. this city. No. 1 mixed papers 60 cents, and common mixed papers 50 cents. White blank news is a weak item and can be bought at 1.65 cents a pound New York. Old kraft paper and magazine stock is moving slowly. Prices f.o.b. New York are as follows:

No. 1 Hard White Shavings	3.65	@	3.85	Ledger Stock	1.60	@	1.75
No. 2 Hard White Shavings	3.00	@	3.25	Kraft, No. 1	2.00	@	2.10
No. 1 Soft White Shavings	2.65	@	2.80	New Manila Cuttings	2.00	@	2.25
Box Board Chips	.70	@	.80	New Manila Env. Cuttings	2.75	@	3.00
No. 1 Colored Shavings	1.60	@	1.80	Bogus & Mill Wrappers	.75	@	.85
Magazine flat stock	1.25	@	1.35	News, strictly overissue	.90	@	1.00
No. 1 Crumpled	1.10	@	1.20	Folded News	.75	@	.80
Solid Ledger Books	1.80	@	1.90	No. 1 Mixed Papers	.60	@	.65
				White Blank News	1.65	@	1.75
				Common Paper	.50	@	55

Twines

There is lack of development in the twine market. Demand is along routine lines and is at best of limited dimensions, consumers in general confining their buying to supplies immediately required. Firmness in raw material, however, is sustaining prices and there is little change in quotations which are as follows:

Sisal Hay, pure	14.25	@	15.25	Jute Wrapping twine, A grade	20.00	@	
Manila Hay, pure	16.25	@	17.25	Papermakers Twine	11.50	@	
Sisal Lath yarn	13.25	@	14.25	B. C. Hemp, 18	.39	@	.40
Manila Rope, pure, ¾ inch diameter	16.25	@	17.25	B. C. Hemp, 24	.38	@	.39
Hardware Rope	14.25	@	15.25	B. C. Hemp, 36	.37	@	.38
Jute rope, ¼ diam. and over, coils	13.00	@	15.00	America Light India— No. 6	14.50	@	
Sail twine, A grade	20.00	@		No. 7	13.50	@	

Chemicals

Papermakers' chemicals are in moderate demand, with the principal movement into consuming channels against contracts. No changes of consequence are reported in quoted prices.

Market Development For Paper Board Products

By JULIAN ARMSTRONG

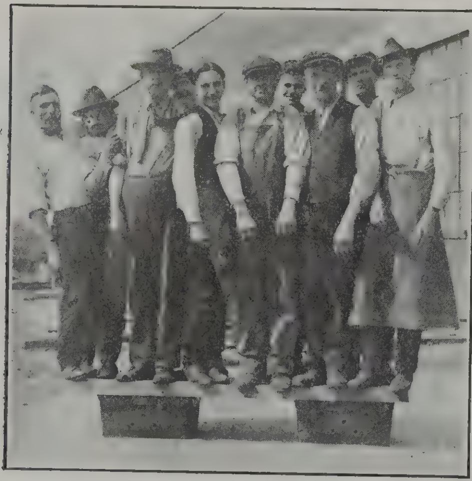
A UNIQUE operating program has been arranged by the Fibopak Company, a Delaware corporation of 100,000 shares of no par value capital stock. The new corporation, with offices in the Wrigley Building, Chicago, will take over the business of the Fibopak Sales Company of Manayunk, Philadelphia, and will undertake other activities as well, some of which are of a most unusual character.

The business of the Fibopak Sales Company has been the manufacture and sale of Fi-Bo-Pak, a fibre container for fruits and vegetables, adapted also for the shipment of bulk confections, small hardware products, and other specialties. This work will be pushed, and additional uses for Fi-Bo-Pak and other paper board products will be promoted as the Market Development Department gets under way.

The Fibopak Container is a seamless carrier, with cover, made of paper board, a laminated structure composed of three blanks folded into shape, placed together with adhesive and compressed into finished form under great pressure. The carriers fo food ae thooughly impegnated with paraffin, providing the necessary waterproof as well as preservatice qualities. Covers are sealed directly to the side walls of the box or held in place by a wire fastening device which permits of easy closing, ready examination of contents without destruction of covers or fasteners, and provides a locking feature which makes the package practically pilfer proof in transit.

Manuftcuring units for Fi-Bo-Pak will be installed in stockholding board mills contiguous to important market centers, the blanks to be purchased from the mills which can provide them most advantageously from the standpoint of price and delivery.

In 1922, the year of their introduction, some 200,000 Fi-Bo-Pak containers were sold, and in 1923 the sales increased to 800,000. This was accomplished with a limited sales organization and a minimum expenditure for advertising. Therefore the field was barely scratched. Past users may be looked upon as permanent customers almost without exception, but Fi-Bo-Pak is still unknown to the vast majority who constitute its potential market.



Two Empty Fibopak Bushels Bearing a Total Load of 1700 pounds.

The company's aim for 1924 is 5,000,000 packages.

A gerat interest has been evidenced in Fi-Bo-Pak (which is thoroughly protected by patents against imitation and infringement) by producers of paper board who see in this package not only the dawn of a new era in the fruit and vegetable field but also an avenue of consumption for the surplus of paper board which has worked a consistent hardship on the business for many years.

Combined weight of men is 542 pounds.

The development of new uses for paper board is one of the prime objects of the Fibopak Company's operations. In its broader interpretation this also encompasses the proper use of paper board, as well as its intelligent manufactue and sale. This pogram is of particular interest to the board mills, container plants, and folding box and carton factories, all of whom, with their trade, it is designed to serve. Many of the factors in these three related groups are affiliating themselves with the enterprise through stock subscriptions.

(1) New Uses for Paper Board

The board mills, with a present overproduction capacity of more than 30%, are vitally concerned with this problem, which can best be solved through discovery of new uses for paper board. New uses for paper board, howeve, will in most cases be found in new uses for containers, cartons and folding boxes, while additional benefits can be secured by market development work to broaden consumption in present fields.

Many paper board products cannot be profitably manufactured and marketed except through a special organization like the Fibopak Company. For instance, the manufacture and sale of a berry box, or "till," alone would probably be unprofitable, but in conjunction with Fi-Bo-Pak, a larger container for fruits and vegetables, these can be profitably handled and will eventually take up a considerable tonnage of board and further develop public interest in paper board products.

(2) The Proper Use of Paper Board

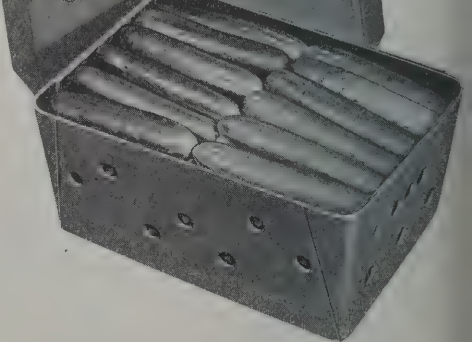
The market development department will undertake to give dependable counsel, information and data to promote the proper use of paper board. Its improper use can easily penalize the entie industry, therefore some special vehicle such as the Fibopak Company, whose operations must necessarily consider the inteersts of all, is the logical medium in which all of the factors in these related industries should center their efforts to encourage and promote the pope use of pape board, and povide against its improper use.

As an example, Fibopak has proved a safe and dependable package for fruits and vegetables, but not for all fruits and vegetables. The industry will directly benefit through the intelligent direction of the sale of Fi-Bo-Pak, but the general development of the use of fibre containers would suffer a substanital setback through its unintelligent direction and the failure of Fi-Bo-Pak to make good.

(3) Intelligent Manufacture of Paper Board

It is not surprising that board milsl and fabricating plants, like any other manuacturing concerns, can be greatly benefited by the advice of experienced engineers. It is far too easy to allow a machine to run as it is, to the apparent satisfactionof the mill superintendent, rather than to make changes in keeping with progress in machine development and mill arrangements.

While it is true there are exceptions to this rule, it is the exception rather than the rule to find plant operations and machine and equipment especially supervised and kept up-to-date, and the education of backward competitors in this respect has proved a profitable co-operative effort.



Cucumbers in Fibopak, ventilated type.

(4 Intelligent Sale of Paper Board and Paper Board Products

The Market Development Department

will gateher market information and data broadly [illegible] entire field of interest to [illegible] company. Therefore it will have [illegible] information covering the current [illegible] rice of paper board, conditions o[illegible] and demand, and simila inforamtion pertaining to the raw material market, as well as the seasonal demand, territorial demand, and possibilities for profitable market devolpement work for its fabricated poducts.

Showing perfect condition of Fibopak upon opening of car door at end of 900-mile trip.

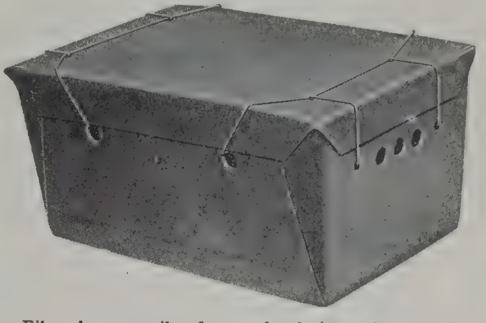
It will gather such information through every reliable source. It will digest government statistics and have such data available in graphic form, which will be of inestimable value in the intelligent manuftcure and sale of paper board and paper board products. This inforamtion will be gathered from individual buyers and sellers.

The following is one exampel of the market development work already accomplished, this in the interest of growers who suffer from overproduction of citrus fruits:

A carload of the Fi-Bo-Pak square box (a smaller container with a capacity for one dozen grapefruit or two dozen oranges shipped, sealed and pre-cooled, direct from the Citrus Fruit Exchange) was purchase for sale on March 20 by R. H. Macy & Company of New York. The sale was announced by an eleven inch advertisement in the New York Times, and by mid-afternoon the car of approximately 2,600 Fi-Bo-Pak boxes had been oversold by 500.

An important and interesting point in this conection lies in the increase in the unit of sale from the customary six or a dozen oranges in paper bags to two dozen in Fi-Bo-Pak. This instance has been duplicated by one of the larger Philadelphia store recently, and a similar intensive merzation in Boston.

Fi-Bo-Pak has been in a measure responsible for the building up of a large and remunerative business in New York, through the repacking of fruits and vegetables, shipped by the growers in Fi-Bo-Pak of standard sizes. Ths New York dischandising plan on the same package is being introduced by a chain store organi-tributor repacks n unique folding boxes or cartons which fit into the larger Fi-Bo-Pak, and delivers the selected fruit to the retailer for resale to the consumer, thus presenting an attractive, saleable unit and minimizing its handling.



Fibopak, unventilated type, for fruits and vegetables. Wires hold cover tightly in place.

Report of the Committee on Waste

By **R. B. WOLF — G. D. BEARCE**

Chairman *Vice-Chairman*

THE Committee on Waste has accumulated information, made investigations and rendered reports during the past two years upon the following subjects:

1. White water losses and their reduction.
2. The utilization of bark and wood refuse.
3. The reduction of broke losses.
4. Heat losses in pulp and paper mills.
5. Handling materials in pulp and paper mills.

White Water Losses

1. The report on White Water Losses covered the results of a number of tests supervised by representatives of the Committee and contained figures supplied by companies interested in this particular problem. The report brought out the fact that the important things to be considered in an attempt to reduce the white water losses in pulp and paper mills are:

1. The reduction of stock loss through re-utilization of white water by means of self-cleaning shower pipes and other methods.
2. The reclamation of fiber and other material in white water by means of various types of savealls.

The sedimentation tank appears to be admirably suited to mills using stock that contains considerable filler. Mills which use a small amount of filler apparently get the best results by a combination of screen saveall and sedimentation tank. The mills that use a long fiber stock exclusively, obtain satisfactory results with one of the various types of screen savealls.

It was pointed out that it is feasible under operating conditions to reduce the fiber and filler to less than 5 lb. of material per 10,000 gallons of waste white water. The maximum allowance for losses based upon pulp or paper production, as indicated in previous reports, is estimated as follows:

1. All long fiber stock 0.5 per cent.
2. Mixed long and short fiber 1 per cent.
3. Short fiber stock 1.5 per cent.

In connection with white water losses the problem of steam pollution cannot be over-emphasized. Many states have laws or pending legislation regarding stream pollution. Among these are the states of Massachusetts, Michigan, Wisconsin and Pennsylvania. If the individual pulp and paper mills study and solve their problems they will not only reclaim fiber that is of appreciable value, but will also meet the requirements of any laws or inevitable legislation regarding stream pollution.

The future work on white water and fiber losses must necessarily be done by the individual companies. The information regarding the tests is available and the data will show them just what can be accomplished at their own mills under their particular operating conditions. The Forest Products Laboratory in cooperation with the Committee is developing a method of comparing the white water losses at different mills. They will ask a number of mills that make the same product to report their stock loss figures to the Laboratory on a standard form. This information will be tabulated and returned to the participating companies so that they will be able to compare results with one another.

Bark and Refuse Utilization

2. The complete report on Bark and Refuse Utilization will be presented in the near future and contains all available data upon bark presses and the furnaces now used in the utilization of wood and barking refuse. The report will cover the various methods of handling this problem under different conditions, and will give figures that will indicate the improved results that can be obtained with adequate equipment control.

Appreciable savings can be effected by the more economical utilization of bark and while tests indicate that each mill has its own particular problem, the construction of the furnace, control of the air, and the method of feeding the fuel are three points that must be given special attention. In general all refuse must be approximately 50 per cent dry in order to be burned with reasonably good efficiency.

Heat Losses

4. The report of Heat Losses in Pulp and Paper Mills outlined the various sources of loss in the entire mill. Each mill has its particular problem and a more detailed study by departments can doubtless be made by the Heat, Light and Power Committee which will result in further valuable information. The heat losses in the sulphite, soda, and sulphate mills should also be considered by the committee that deal with the manufacture of these pulps.

The Utilization of Decayed Wood for Pulp

This is one of the most important problems that confronts pulp and paper mills at the present time. Realizing that it is an international problem a Joint Committee was appointed to cooperate on this work, representing the Technical Association, Woodlands section of the Canadian Pulp and Paper Association, the Forest Products Laboratory, and the News Print Service Bureau. During the present year the cooperation of the Woodland section of the American Paper and Pulp Association. Much valuable information has already been obtained and further reports will be submitted to the Technical Association as the work progresses.

Recommendations

The Committee believes that its main function in the future should be to assist the regular standing committees to take up problems dealing with the elimination of waste in their respective fields. The Committee should act as a coordinating medium with such organizations as the Forest Products Laboratory and the Bureau of Standards in order to make available the results of their findings. The Committee should also assist these agencies to continue their cooperative studies on waste elimination problems at the various mills interested in this work.

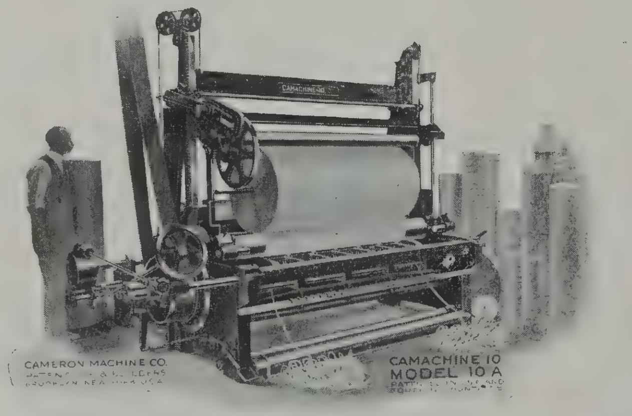
UNIVERSAL



Of universal application to the needs of wholesale paper warehouses, paper dealers, paper converting plants and paper mill finishing rooms is CAMACHINE Universal Type 10 Model 10A, illustrated here. This machine is built in widths 42″, 52″, 62″, 72″ and 82″ and will wind rolls to a maximum diameter of 36″. Descriptive literature covering this and others of the complete line of Camachines, which cover every roll requirement, will be sent on request.

Cameron Machine Company
61 Poplar Street Brooklyn, N. Y.

A ROLLING STONE GATHERS NO MOSS

BUT, Paper rolled by Press Rolls of Barre Granite gathers increased profit for those whose machines are equipped with these famous rolls.
Full information about them will be sent upon request.

GOOD PAPER
—GOOD RESULTS

The effectiveness and pulling power of Direct Mail literature depends entirely on the proper selection of Paper. The finest illustrations possible or the best copy cannot get your message across if produced on paper that cannot stand the strain.

FRANKFOLD Enamel

a paper built for a purpose, will answer the requirements unusually well. The extra long, firmly knitted fibres assure good folding qualities and a required sturdiness. The beautiful and uniformly smooth surface will faithfully reproduce the sharp details of mechanical subjects or the subtle shades of color work.

FRANKFOLD ENAMEL preserves that freshness and inviting appeal so essential to successful direct-mail literature.

We will gladly forward some printed specimens or blank sheets for dummy purposes.

The Franklin Coated Paper Company
Franklin, Ohio
Eastern Sales Office:
110 E. 42nd Street New York City

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not only by what you put into the equipment but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged anywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

PULPWOOD AND WOOD PULP IN NORTH AMERICA

By Royal S. Kellogg

Author of "Lumber and Its Uses," "The Cost of Growing Timber," "The Timber of the United States"

270 Pages 87 Illustrations

A graphic presentation of one of the vital economic problems of the day—the securing of an adequate supply of paper.

This book is of special interest to everyone connected with the pulp and paper industry and equally so to all users of print paper. It points out clearly what must be done to develop sufficiently our supply of pulpwoods.

PRICE $4.00

Hughes Publishing Company, Inc.

THE CLEARING HOUSE
OF THE PAPER INDUSTRY

Situations Wanted, Help Wanted, Machinery for Sale, Machinery Wanted, Business Opportunities, Materials Wanted and For Sale, Business Wanted or For Sale.

Advertisements in this department cost $1.00 for 25 words or less, payable in advance. Additional words, two cents each. This price covers the cost of remailing answers directed to boxes, care of this office. Matter for insertion should reach the office of PAPER not later than the Saturday preceding date of issue.

All Advertisements under the Situations Wanted or Help Wanted Classifications are published FREE OF CHARGE, except for cost remailing letters addressed here.

POSITIONS WANTED

TECHNOLOGIST in stained paper field, about 30 years' practical experience, specialist in paper, cardboard and paper board fields. Can furnish formulae. Solve manufacturing industries and install new improvements, particularly in the following fields—glazed paper, chromo papers, art printing papers, stained paper, marbled paper, carbon paper, waxed paper, etc. Can secure all materials as well as machines. Regular technical advice given.

WILHELM REINICKE,
34 Melanchthonstr.,
Crimmitschau i.Sa., Germany

Graduate Chemical Engineer—Two years' experience in research laboratory, lately manager of a coated paper factory in France, desires position. Best references. Address Box 1298, care of PAPER.

Capable, resourceful, energetic man, 20 years' experience in handling of pulp and paper mill stores—stores accounting—cost work and general office routine, desires position of purchasing agent, assistant purchasing agent or any executive position connected with pulp and paper mill supplies. Satisfactory references. Address Box 1299, care of PAPER.

Single young college man, American with several years experience with Canadian newsprint manufacturers now ready for position of wider opportunity. This with approval and assistance of present employers. Experienced in paper mill, in engineering dept., sales office and especially in handling statistics. Capable of organizing and maintaining statistical department, chart control, reports, etc., or making himself useful in sales or manufacturing departments. Excellent references. Address Box 1292, care of PAPER.

ACCOUNTANT-EXECUTIVE, specializing in the solution of problems in the stores, cost and accounting departments, wants permanent position with manufacturing concern. Good accounting education and fourteen years' experience in varied lines of industry, including public accounting work in the installation of stores, cost and accounting systems. Successful in handling situations requiring tact and diplomacy. Progressive and up-to-date. Age 36. Present location Central States and location considered. Address Box 1293, care of PAPER.

FOR SALE—Unlimited quantities of finest pulpwood. F.o.b. mill in New York State, $23.75 per cord. Address Box 236, care of PAPER, 1478 Broadway, New York City.

POSITIONS WANTED

CANADIAN, 26, college trained, with 3 years in big news mill office and control work, wants a chance in export or selling organization. Address Box 1294, care of PAPER.

GRADUATE CHEMIST, age 21, wishes position as junior in pulp and paper mill. Available May 1. Address Box 1295, care of PAPER.

PAPER SALESMAN—University graduate with chemical experience in the manufacture of pulp and paper desires to connect with a firm where hard work and results will be rewarded. All correspondence strictly confidential. Address Box 1287, care of PAPER.

GRADUATE mechanical engineer, age 31, married; practical experience in newsprint and fine writings; assistant superintendent of specialty mill; at present selling; desires to give up traveling and join paper organization in production capacity. Address Box 1297, care of PAPER.

SULPHITEMAN, university graduate, with five years' experience as laborer, foreman and chemist at mills making both strong and easy bleaching pulp desires position. At present employed, as chemist but desires change and prefers a position as superintendent or assistant. Address Box 1296, care of PAPER.

FOR SALE

Beaters—One N & W 48x48 rolls, 21"-6". Two iron tub rolls 52"x40".

Bed Plates—Large lot, all sizes. New.

Calenders—One 7 roll 72"; one 9 roll 72"; one 5 roll 78"; one 7 roll open side 84". One 7 roll 124".

Calender Rolls—Large assortment, all sizes; one 14x86"; one 18x84"; one 18x100" and many others.

Coaters—One 45" Waldron, double coater, and others.

Cutters—One 38" Guillotine.

Cylinder Moulds—One 36"72"; one 30"x52"; one 12"x22".

Drives—One No. 1 Reeves Class E; two No. 3 Reeves Class E, 4 to 1; one No. 3 Class E; one No. 6 Large Reeves; one No. 10 Reeves, F-3 to 1 with extra disc.

Dryers—48x116.

Exhausters—One Sturtevant.

Fans—3 Hunberry; 2 Perkins.

Jordans—One N & W Monarch, with new shell two Horne; two Emerson, large size, one base; one N & W Pony, with extra plug.

Pulleys—One 98"x34" face, double arm, modern, Iron pulleys; Cone pulleys for Marshall Drives.

Pumps—One dry suction Knowles 12x22x18; one 1000 gal. Blake Tank pump; two Lawrence Mch. Co.'s Class A 8" high duty; two 6" Emerson make; one 4" Centrifugal; one Type 4 Gould 5" triplex, self contained. Two Lawrence Machine Co.'s Class A, No. 4, double suction pump for high elevation or for low speed. Thoroughly rebuilt and ready for shipment.

Press Rolls—One pair new, one RC 18x80"; one Gun metal 18x81"; one 16x75"; one RC 15½x73½".

Rag Cutters—Two No. 2 Daniels; one Perkins.

Screens—4-8 pl. New Success.

Slitters—One 86" P & J.

Winders—One 86" P & J; one 100" P & J; one 112" M & W.

Wet Machines—One N & W with cut offs, mould 30x52"; two spare moulds.

One set Dillion Doctors for 80" calender rolls.

MILLS MACHINE COMPANY

THE CLEARING HOUSE—Continued

MISCELLANEOUS

WANTED—A paper company to locate a large pulp and papermaking plant in North Carolina, with a million cords of pulp wood deliverable at the plant at $3.75 a cord, a saving of $20,000,000. Lands for plants, fronting deep water for deep sea loading. Millions more cords of wood available very cheap. A clear stream of fresh water free for washing pulp. Address Box 245, care of PAPER, 1478 Broadway, New York City.

REPRESENTATION is solicited of responsible mill which seeks to sell paper or pulp in this country. Considerable experience and success enjoyed in the industry. Age 34; university training and well connected. Will share expense of a trip to home office of mill interested in interview. Address Box 1289, care of PAPER.

EXPERIENCED publicity and advertising man who can make paper carry any desired message of interest to the promoter, for any legitimate business or its expansion for greater profit, is open for engagement. Address H. C. Beatty, Box 58, Wilkinsburg, Penn.

GLASSINE—GREASEPROOF

Who's opportunity is it? Please note: My first venture in a paper mill was in 1884; since 1888 I studied and worked in all kinds of positions, particularly in the manufacture of glassine, greaseproof and specialties. In 1896 I was granted patent relating to an improvement in machinery for the manufacture of high-grade finished transparent glassine; patent letters are in my possession. I have been supervisor and in charge of the first production of said greaseproof glassine first in my native country, Bohemia, later in Germany, Finland, Italy, Holland; then I received an unexpected call to United States. For practically 15 years, beginning 1906 up to 1921 I have been superintendent of the glassine department of one paper mill in U. S. A. A new connection is desired to give service of my lifetime experience. Emil Pohl, Austin, Penna.

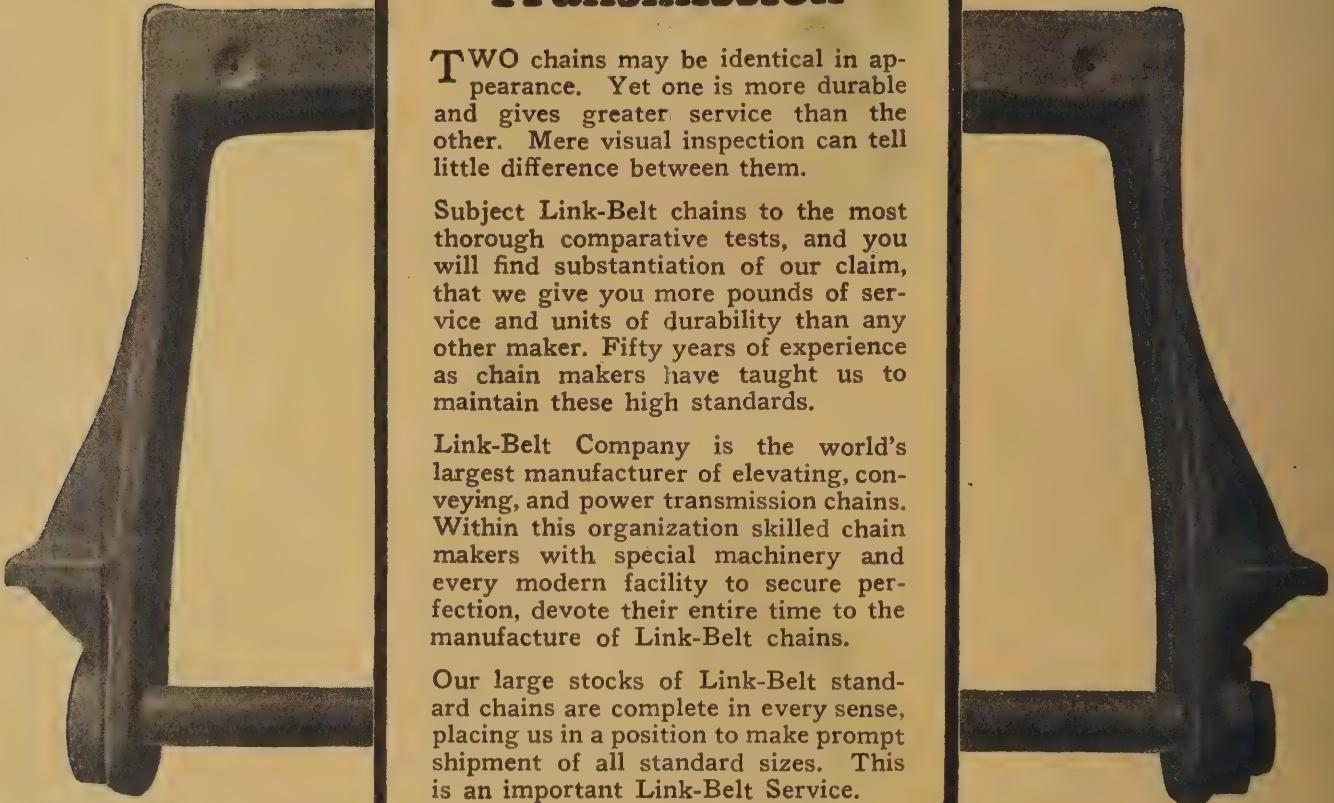
Use Genuine Link-Belt Chain for Conveying and Power Transmission



TWO chains may be identical in appearance. Yet one is more durable and gives greater service than the other. Mere visual inspection can tell little difference between them.

Subject Link-Belt chains to the most thorough comparative tests, and you will find substantiation of our claim, that we give you more pounds of service and units of durability than any other maker. Fifty years of experience as chain makers have taught us to maintain these high standards.

Link-Belt Company is the world's largest manufacturer of elevating, conveying, and power transmission chains. Within this organization skilled chain makers with special machinery and every modern facility to secure perfection, devote their entire time to the manufacture of Link-Belt chains.

Our large stocks of Link-Belt standard chains are complete in every sense, placing us in a position to make prompt shipment of all standard sizes. This is an important Link-Belt Service.

Send for Link-Belt General Catalog No. 400. It contains 832 pages, and is a complete guide to those using chains for elevating, conveying or power transmission purposes. Sent on request to our nearest branch office.

1565

This illustration shows but one of many hundreds of various Link-Belt Chains. There is a Link-Belt Chain for every service.

S. and Possessions; $5.00 in Canada and Foreign Countries; Single Copies 10 cents, an extra charge being required for back numbers. Entered as second class matter November 8, 1922, at postoffice at East Stroudsburg, Pa., under Act of March 3,1879.

MATHIESON System

An Existing Bleach Plant

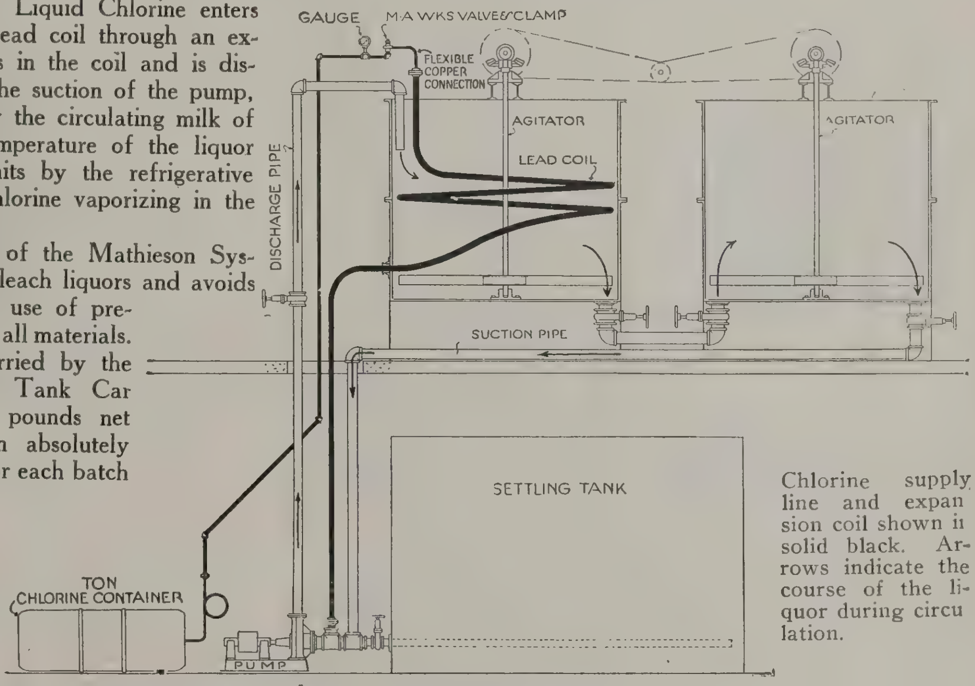
Readily Adapted to the Use of Liquid Chlorine

THE accompanying drawing illustrates how the existing bleach plant of the Crystal Tissue Company, Middletown, Ohio, was easily converted to the use of Liquid Chlorine by the Mathieson System. Necessary additional equipment consisted only of the chlorine connections and supply line and the lead expansion coil installed in one tank.

The two former bleach-mixing tanks now operate as a single unit, the combined capacity being sufficient to take the full contents of a ton container of Liquid Chlorine. The Liquid Chlorine enters the upper end of the lead coil through an expansion valve, vaporizes in the coil and is discharged as a gas into the suction of the pump, where it is absorbed by the circulating milk of lime solution. The temperature of the liquor is kept within safe limits by the refrigerative effect of the Liquid Chlorine vaporizing in the immersed coil.

The Batch Method of the Mathieson System produces uniform bleach liquors and avoids overchlorination by the use of predetermined quantities of all materials. The ton containers carried by the Mathieson Multi-Unit Tank Car are of exactly 2000 pounds net weight and provide an absolutely accurate unit measure for each batch of bleach liquor.

Let our Technical Department demonstrate how the many advantages of the Mathieson System can be realized in YOUR plant.



Chlorine supply line and expansion coil shown in solid black. Arrows indicate the course of the liquor during circulation.
